TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BRISTOL.—For the erection of new branch offices, for the Star Life Assurance Society. Mr. A. Blomfield Jackson, architect, 26, Mecklenburgh-square, London:—

E. Walters	£16,535	Stephens and Bastow	£14,749
J. Perkins	16,100	G. Humphreys	14,600
W. Cowlin	15,859	A. J. Beaven*	14,200

* Accepted.

BAKEWELL (Derbyshire).—For the erection of Infirmary, &c, at workhouse, for the Union Guardians. Mr. E. M. Longdon, architect, Town Hall, Bakewell. Quantities by architect:—

Geo. Knowles, Matlock	£6,491
Cox, Wilson and Sons, Ashford, Bakewell* ...	6,167

* Accepted.

Aspinall's Wapicti

THE "SANITARY" WASHABLE DISTEMPER.

MADE IN ALL SHADES. ECONOMIC AND ARTISTIC.

"WAPICTI" is highly suitable for the Interior Decoration of Churches, Chapels, Hospitals, Schools, Artisans' Dwellings, Meeting Rooms, &c.

Used by most of the Municipal Bodies, and recommended by Architects at Home and Abroad.

UNEQUALLED FOR ALL INTERIOR DECORATIONS.

Full Particulars on application to

ASPINALL'S ENAMEL LTD., New Cross, London, S.E.

BIRMINGHAM.—For the erection of casual wards at the workhouse, Selly Oak, for the King's Norton Guardians. Messrs. C. Whitwell and Son, architects, 23, Temple-row, Birmingham. Quantities by Mr. T. H. Mansell:—

Hunt Bros.	£6,438	F. Nicholls	£5,712
Fincher and Co.	6,400	Harley and Sons	5,597
Moffat and Sons	6,250	T. W. Halward	5,567
Beach and Co.	6,000	W. S. Seamark	5,555
E. J. Charles	5,991	R. M. Hughes	5,492
Freeman and Sons	5,989	W. Bishop	5,477
Bowen and Sons	5,840	Whitehouse and Sons, Birmingham*	5,469
T. Loud	5,795		
W. H. Gibbs	5,787		

*Accepted.

BRISTOL.—For re-building a factory, Fairfax-street, for Messrs. Pannall and Sons, Limited. Mr. William Paul, architect, Wells-road, Bristol. Quantities by the architect:—

C. A. Hayes	£3,343	Wilkins and Gosling	£2,869
Wm. Church	3,169	R. F. Ridd*	2,825
Cowlin and Son	3,164		

* Accepted.

BURES ST. MARY (Suffolk).—For the erection of a malt kiln. Mr. C. J. Hair, Bugle-street, Southampton, and Mr. G. H. Page, Trinity-chambers, Colchester, joint architects. Quantities by Mr. J. F. Crook, 39, Cambridge-road, Southampton:—

E. West	£1,150	Grimwood and Sons	£1,099
F. Dupont	1,137		

DEVONPORT.—For the erection of five blocks of buildings for artisans' dwellings for the Town Council. Mr. J. F. Burns, Borough Surveyor, 30, Ker-street, Devonport:—

T. King	£11,375 11	Wakeham Bros.	£8,354 0
R. G. Jenkins	8,990 0	Goad and Co.	8,297 0
C. and W. C. Rowell	8,950 0	H. Skinner	8,202 0
T. May	8,628 0	Lethbridge and Son	7,998 0
A. N. Coles	8,500 0	S. Roberts, Plymouth (accepted)	7,094 8

GRAYS.—For alterations for the Capital and Counties Bank, Limited. Mr. Christopher M. Shiner, architect, 3, Bond-court, Walbrook, E.C.:—

Davey Bros.	£1,930	H. R. Rous	£1,750
Potter	1,800	J. Brown	1,655

GREENWICH.—For the erection of offices, &c., for the Directors of the East Greenwich Mutual Benefit Building Society. Mr. Alfred Roberts, architect, 18, Nelson-street, Greenwich, S.E.:—

F. J. Gorham	£1,450	Henry Bridel	£1,280
Hayter and Son	1,375	F. P. Smith	1,274
W. Mills	1,363	E. Mills*	1,191
Jones and Groves	1,339		

* Accepted.

LEICESTER.—For erection of new schools, Narborough-road, Leicester, for the Free Christian Church. Mr. Chas. Kempson, architect. Quantities by the architect:—

Herbert and Son	£1,298	H. Bland	£1,145
Bentley and Co.	1,206	Bradshaw Bros.	1,134
W. Haddon	1,205	W. Jayes	1,099
J. R. Tebbett	1,168	F. Elliott*	1,068
E. J. Rudkin	1,146		

* Accepted.

LEICESTER.—For the erection of a house near Leicester for Mrs. Turner and Miss Pettifor. Mr. Edward Turner, architect, Bank-buildings, Leicester:—

Johnson and Son	£1,308 10 0	J. Pipes	£1,205 0 0
Bentley and Co.	1,225 0 0	F. E. Elliott	1,193 0 0
T. Herbert	1,224 4 6	G. Holt*	1,124 0 0

* Accepted.

LONDON.—For shop front, &c., at the West Ham Brewery, Romford-road, Forest Gate, E., for Mr. R. W. Reeve. Mr. Fred A. Ashton, architect, 177, Romford-road, Stratford, E.:—

I. and H. Cocks	£1,149	A. E. Symes*	£1,125
G. J. Hosking	1,139		

* Accepted subject to modification.

TRURO.—For the construction of cast iron water mains, for the Rural District Council. Mr. R. Hansford Worth, C.E., 42, George-street, Plymouth. Quantities by engineer:—

J. Thaddock	£6,923 7 3	R. J. Thomas	£5,831 0 0
E. Duke	6,319 13 0	Hooper Bros. & Roberts, St. Agnes*	5,743 11 10
R. H. B. Neal	6,090 0 0	A. Delbridge	5,700 0 0
H. E. Skinner	6,076 16 3		
Hawking & Best	5,953 5 10		
W. C. Thaddock	5,841 0 0		

* Accepted.

TUNBRIDGE WELLS.—For the erection of first portion of parish room and institute, St. John's. Messrs. H. H. and E. Cronk, architects, Mount Ephraim-road, Tunbridge Wells. Quantities by architects:—

G. Hudson	£3,692	Strange and Sons	£3,113
Turner and Co.	3,449	Crates and Son	2,970
J. Jarvis	3,380	Bowman and Sons, Stamford*	2,900
Padgett and Son	3,293		
Davis and Leaney	3,239		

* Accepted.

2, Army and Navy Mansions, Victoria Street, London, S.W.

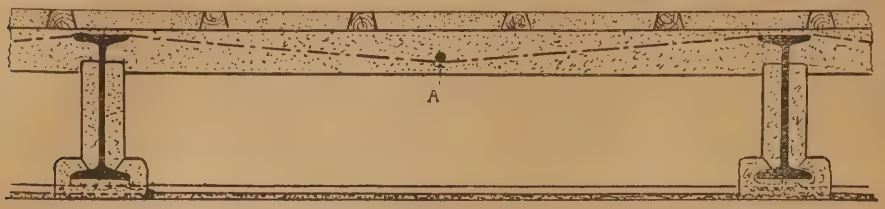

FIG. 1.

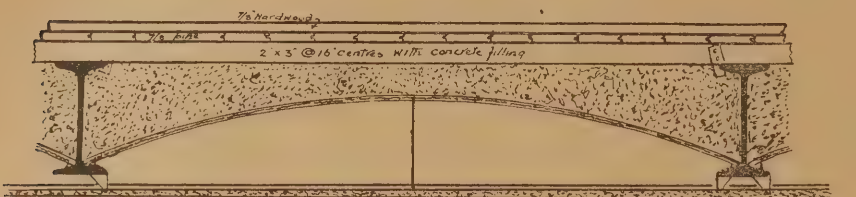

FIG. 2.

FIREPROOF CONSTRUCTION IN AMERICA.—I.

BY J. RAWSON GARDNER, OF MONTREAL.

FIREPROOF construction has become a most important feature in nearly all large modern buildings, and therefore forms a subject for serious study to all those interested in building.

The methods employed to make a structure fireproof are numerous, but they may be classified, as a rule, under two headings:

1. Concrete construction.
2. Hollow tile construction.

In both these forms of construction there are several important conditions to consider and weigh well before deciding on their respective merits. These may be arranged for convenience in the following order, as they apply equally to both forms of construction:

1. The materials used must be fireproof and able to withstand both fire and water simultaneously.
2. The constructional iron or steel must be entirely covered and sufficiently protected.
3. The material covering the steel or iron must not radiate sufficient heat to injure the metal.
4. The weight of the floor.
5. The depth of the floor.
6. The cost.

All these items should be carefully considered before deciding definitely on the relative merits of a system of fireproofing. It will, however, be the purpose of this paper to point out some of the various methods in use on this side of the Atlantic, rather than the pros and cons. of the different systems.

Let us take, then, the four following systems, which will show somewhat the field embraced by concrete construction.

1. Metropolitan system.
2. Roebling system.
3. Expanded metal system.
4. Ransome system.

I. The "Metropolitan" system (formerly called the Manhattan) is erected by the Metropolitan Fireproofing Company of Trenton, New Jersey. The usual floor construction (shown at Fig. 1) is constructed as follows:—A $\frac{3}{4}$in. iron bar (marked A) runs the length of the floor in the centre between the steel beams; under this bar and over the upper flanges of the beams is a network of twisted wires placed $\frac{7}{8}$in. to $1\frac{1}{2}$in. apart, according to span, of two No. 12 galvanised iron wires twisted. Centres are then erected 1in. below the iron bar A, on which a composition or concrete composed of plaster of Paris, 75 per cent.; wood chips, 20 per cent.; and cocoanut fibre and asbestos, 5 per cent., is filled in, after being mixed with water to the consistency of ordinary mortar. This is brought up to a level of $\frac{1}{2}$in. over the beams, so as to protect the wires. The webs of the beams are protected with 2in. slabs of the same material, and the lower flange with a 2in. covering of composition, held in place by $\frac{3}{4}$in. by $\frac{1}{4}$in. flat iron bars, spaced about 16in. centres, which are fastened to the beams by metal clips. If a flat ceiling is required, patented wire lathing is stretched across from beam to beam, and plastered.

II. The Roebling system, as erected by the John A. Roebling Sons Company, of Trenton, New Jersey, is shown at Fig. 2, which gives the usual floor construction erected. The concrete used is what is commonly called "cinder" concrete, composed of one part best Portland cement to two and a half parts of sand and six parts of ashes from steam boilers.

The chief distinctive feature in this system is the $\frac{1}{4}$in. steel rib woven in the wire lathing which forms a centreing for the segmental arch between the steel beams.

The partitions erected by this firm are similar to those built in concrete or plaster by other firms, and are as usual in practice. Fig. 3 shows the construction for a solid plaster partition finishing 2in. thick. The weight is about 20lb. to the square foot.

The studs consist of $\frac{7}{8}$in. channels or 1in. by $\frac{3}{16}$in. flat iron spaced 16in. centres, and securely fastened at floor and ceiling. Across this studding painted wire lathing, stiffened with $\frac{1}{4}$in. steel ribs woven every $7\frac{1}{2}$in., is laced to studs with galvanised wire, the stiffening ribs running crosswise over the studs. All necessary wood furrings are set in position and fastened to studding.

A solid fireproof partition, finished 4in. thick when plastered, is shown at Fig. 4. As the cinder concrete will receive nails, &c., no wood furring is necessary in this form. A similar partition is often erected with the concrete core left out, and a hollow partition thereby made with wood strips or blocks inserted where necessary for nailing wood trimmings. The solid partition weighs about 32lb., and the hollow one about 22lb., per square foot.

III. The expanded metal system is shown at Fig. 5, and is a form of stamped steel lathing stretched over the upper flanges of steel beams, and as is claimed in a pamphlet issued by the makers: "The introduction of metal in the lower part of a concrete plate is strict construction, as concrete and steel have practically the same changes under like thermal conditions. Steel embedded in a non-porous concrete is practically imperishable. The cohesion between steel and concrete is nearly five times the tension of concrete, and the relation of tension to compression in concrete is practically one to ten. Finally, concrete is an excellent material in compression."

It is somewhat on these lines that the next system, the "Ransome," is based.

IV. The "Ransome" system was invented by Ernest L. Ransome, who has studied and worked out the theories of concrete construction (as well as erected work) as much, perhaps, as any man. The method employed by him of embedding a square or twisted steel bar in the tensile area of the concrete beam, instead of the usual rolled steel beam in the other three forms of construction, marks out this system entirely from the others. Mr. Ransome claims that by doing away with the upper section of the steel beam, and by placing the concrete not required in the lower (or tension section) into the upper (or compression) section, you will use both the iron and concrete to the best advantage. The usual floor construction is shown at Fig. 6. Instead, however, of cutting the upper half of the steel beam and leaving a ⊥ in lower half, there is substituted a cold twisted iron bar which is calculated to stand a tensile stress of 10 tons per square inch of sectional area. For the concrete, $\frac{1}{4}$-ton is allowed as the compressive stress; therefore the concrete will be forty times the sectional area of the twisted iron bar. The composition used is made as follows: One part best Portland cement to three parts of aggregate (stone, granite, and gravel). It is very important that the concrete be laid without stopping until the whole thickness of the floor is laid, so that the concrete may be one homogeneous mass. It is claimed that this form of concrete, while giving the best results as to compressive strength, adds considerably to the weight over the cinder concrete, so that the following table may be of interest:

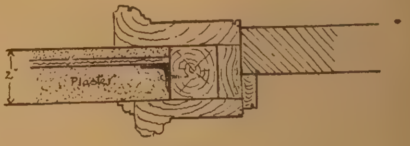

FIG. 3.

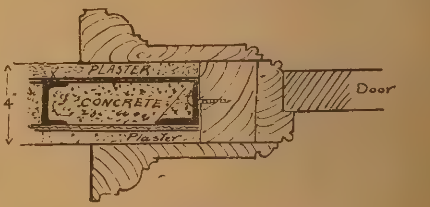

FIG. 4.

Table of Comparative Weight per sq. ft.

Span in feet.	Safe load per sq. ft.	Weight of beam and tile floor.	Weight of Ransome floor.
12	75	35lb.	23lb.
12	125	37lb.	25lb.
16	75	43lb.	27lb.
16	125	46lb.	36lb.
20	75	52lb.	36lb.
20	125	55lb.	44lb.

Which shows about 10lb. per sq. ft. in favour of the concrete "Ransome" system floor.

What can practically be accomplished by this floor construction is shown by the following table, which is taken from a pamphlet issued by the firm of Ransome and Smith Co. The following rule is observed in this table: Thickness of web of concrete beam is three times the section of iron bar, so that with a

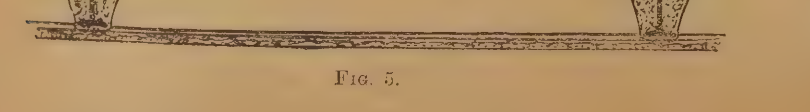

FIG. 5.

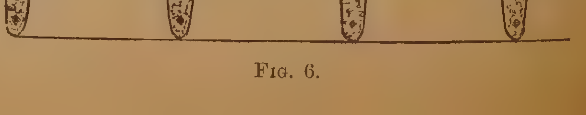

FIG. 6.

twisted bar 1in. square the web of concrete would be 3in. thick.

Safe floor load in lb. per sq. ft.	Approx. weight of floor in lb. per sq. ft.	Size of twisted bars in sq. inches	Thickness in inches of floor plate.	Depth of beam in inches.	
50	18	½in.	1in.	7·5	For 12ft. span.
75	23	¾in.	1¼in.	4·75	
125	25	¾in.	1¼in.	7·5	
250	37	1in.	2in.	8·25	
50	25	¾in.	1¼in.	6·5	For 16ft. span.
75	27	¾in.	1¼in.	9·0	
125	38	1in.	2in.	8·75	
250	46	1in.	2in.	14 5	
50	29	¾in.	1¼in.	10 75	For 20ft. span.
75	33	¾in.	1¼in.	14·75	
125	45	1in.	2in.	13·25	
250	62	1¼in.	3in.	16·	
50	48	1in.	2in.	10·5	For 30ft. span.
75	54	1in.	2in.	22·0	
125	71	1¼in.	3in.	22·5	
250	130	1¾in.	5¼in.	27·0	

"Depth" of beam in the above table means the distance between the upper side of the floor plate and the twisted iron bar. The total depth of floor will, therefore, be twice the size of the iron bar, added to the "depth," this being the rule for the amount of concrete below the bars.

The above notes will give, it is hoped, some idea of the methods employed in the States and Canada for concrete fireproof construction. In a following paper it is purposed to give a few examples explaining some systems of hollow tile construction.

(To be concluded.)

Surveying and Sanitary Notes.

Sewage Scheme at Baildon, Shipley.—The Blaidon District Council propose to carry out extensive sewage works at a cost of £9,060. A Local Government Board inquiry has been held.

Jarrahdale. — The authorities of the Greater Britain Exhibition have awarded a gold medal for jarrah to the Jarrahdale Jarrah Forests and Railways Limited. The firm has just received a supply of 1037 loads.

The Climax Ventilating and Heating Co., Ltd., of 93, Hope Street, Glasgow, have supplied Cousland's improved "Climax" patent natural exhaust ventilators for the accountants' department at the General Post Office, Dublin.

Are Boulders "Rock?"—Mr. Charles Jackson, engineer, Manchester, the arbitrator appointed by the Court of Appeal, has published his award in the action of Braithwaite v. Ilkley District Council. The plaintiffs are contractors carrying on business in Leeds, and sued the Ilkley District Council for work done in connection with the new sewage works at Ben Rhydding. The point in dispute was whether the plaintiffs were entitled to be paid extra for the excavation and removal of blocks of stone or boulders, and also for certain alterations and deviations made in the contract. The defendants contended that though the plaintiffs were entitled to be paid extra for "rock," boulders of the kind described did not come within that term. They also denied that there had been any deviation. The arbitrator has found in favour of the plaintiffs' contention and awards the sum of £616 7s. 7d., defendants to pay all costs.

PUBLIC HEALTH CONGRESS.

FULL particulars of the opening of this congress at Blackpool on September 21st, and of some of the papers read on the two following days, were given in our issue for last week. Excursions and visits were made on Saturday, Sunday, and Monday, but on Tuesday, the 26th, work was resumed. At the conference of sanitary inspectors Dr. Vacher, the president of that section, traced the history of sanitary laws, and, reaching to our own times, enumerated the grievances of those interested in sanitary progress. It was inconceivable, he said, how such a wicked system sprang up as that which made sanitary officials dependent for reappointment at short intervals on the goodwill of the local authority. They had not even what the police possessed—a system of superannuation. Their salaries were inadequate—in many cases not more than £70 a year. There was no provision for technical instruction, and they had no representation on the examination board.

Any prototype of the medical officer of health or sanitary inspector he had failed to find, unless it were in the beadle (or bidder), who seemed to have exercised some functions as a nuisance inspector, to have required the removal of garbage, and to have superintended the lighting of fires after outbreaks of plague and low fever—called bonfires, "for the virtue that a great fire hath to purge the infection of the air." He trusted that the health officer and sanitary inspector was as great an improvement on the beadle of past centuries as the general practitioner was the superior of the apothecary familiar to us in the pages of some old dramatists. He drew a vivid picture of the dreadful state of things in the middle ages—the times of incredible mortality, because people then lived in conditions of great filth, and the physicians ascribed epidemics and endemics to astral and telluric influences, and prescribed for their patients accordingly.

In the Engineering and Building Construction Section Mr. A. H. Tiltman, of London, read a paper on "Public Baths and Washhouses." He confined himself entirely to the changes, generally and in detail, which he considered to be necessary in the distribution, classification, and arrangement of these establishments. M. W. P. Liernur, of Paris, read a paper upon the "Disposal of Sewage," in which he explained the Liernur system of town sewering by evacuation process, adopted in Trouville and other continental towns. A paper on "The Sanitation of Agricultural Buildings" was contributed by Mr. Albert Simpson, J.P., of Garstang. The attention of the authorities, he said, had of late years been given to the sanitation and construction of all classes of buildings, and the condition of our agricultural buildings was found to be very imperfect. His remarks were directed wholly to the important question of ventilation without draughts where cattle were housed, and he submitted a large model of a shippon which provided for a perfect system of ventilation without the slightest draught. The last paper submitted to this section was one by Mr. J. H. Brierley, borough surveyor of Richmond, Surrey, upon "Artisans' Dwellings." Mr. J. A. Priestley read a paper on "The Anomalies of Public Health Law," and contended that the legislature should extend, amend, and consolidate the public health statutes.

At a general meeting of the Congress held in the Grand Theatre (Lord Lorne presiding, and being supported by Sir Matthew White Ridley, the Mayor of Blackpool, and Sir Charles Cameron), the work done during the week by the various sections was put together and given the official stamp of the Institute. The Congress ratified resolutions, calling upon the Government to undertake the control of the smoke nuisance, emphasising the necessity for the efficient examination of sanitary inspectors, expressing the opinion that cremation is the most sanitary method for disposing of the dead, and that crematoria should be erected in populous districts, protesting against the Local Government Board for fixing time limits for the repayments of loans without proper regard for the permanence of the undertakings for which the loans were raised, and calling for the Local Government Board to bring about remedial legislation in regard to the present unsatisfactory state of the law as to sanitary conveniences.

More excursions were indulged in on Wednesday, Sept. 27th, and the Congress broke up on the following day, after doing a week's good work.

Builders' Notes.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the Convent, Norwich.

The New Workhouse Hospital, Sunderland, is being warmed and ventilated by means of Shorland's patent Manchester stoves, some single fronted and some double fronted, with descending smoke flues, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Foreign Cement.—Large quantities of foreign cement are now being imported into the United Kingdom, including some of very poor quality, adulterated with slag. It is often sold to buyers as English cement, and bears the name of "Portland," often without any indication that it is made abroad. Some of the English makers have asked that the authorities should forbid the importation of this foreign cement until the bags bear a title or mark that will enable the consumer to know that the cement is made abroad.

Charge against a Paisley Builder.—At a special meeting of Paisley Dean of Guild Court last Thursday—Bailies Wilson, Galbraith, and Allison on the bench—a petition was presented at the instance of the Procurator-Fiscal against Daniel Gold, builder, with regard to a four-storey tenement at present being erected by him at Underwood Lane, Paisley. The petitioner claimed an interdict penalty and expenses against Mr. Gold, alleging that he had deviated from the lining granted to him by the Dean of Guild Court, in so far as the walls of the building, which were half-way erected, were constructed in an insufficient and untradesmanlike manner, so as to seriously endanger the stability of the building. The petitioner also asked that the walls be directed to be taken down and re-erected to a certain extent. Respondent denied the charges made in the petition, and the case was adjourned till Wednesday next to allow of answers being lodged. It was explained by the Fiscal that interim interdict had been granted against Mr. Gold proceeding with the building. Respondent's agent asked that this interdict be recalled except as regarded the east wall. Mr. Lees, master of works, said he did not think it would be wise to allow Mr. Gold to go on with any part of the building. In fact, he insisted on its being stopped until the whole matter was settled. The interdict was accordingly maintained until the further hearing of the case.

A Big Cumberland Water Scheme, which is estimated to cost £22,000, is now under consideration by the Wigton Rural District Council.

Extension of Gloucester.—The Gloucester City Council have received a report on the extension of the city boundaries in all directions, for which purpose nearly seven thousand acres of country territory would be taken. The rateable value of the town would be increased from £180,000 to £225,000, and seven thousand five hundred persons would be added to the present population of forty-three thousand. The Council instructed the Committee to prepare a further report, with a view to an application being made to the Local Government Board.

Engineering Notes.

At the India Office a complete installation of electric light is being provided.

Emanuel Church, Exeter.—Messrs. John King, engineers, Liverpool, are now fitting their latest hot-water heating apparatus, and patent tubular exhaust ventilators in this church.

Electric Tramways Objected to.—The "Celestial Empire," published in Shanghai, announces that the Yokohama jinrickisha men, numbering 4200, have formed a league to avert the introduction of electric tramways in that port.

A big Tramway Scheme for Leeds.—The Leeds Tramway Committee passed a resolution on September 25th recommending the city council to adopt the overhead electric system for about seventeen miles of streets. The estimated cost is £160,000.

Electric Lighting at Lerwick.—It is proposed to introduce the electric light into Lerwick, and to obtain the necessary power from the surplus water from the Sandy Loch, which at present supplies the town. This surplus water would give 80 h.p. for six hours a day, the gross fall being 220ft. It is recommended that a turbine house should be built at the Loch Clickimin and connected with Sandy Loch by 2000yds. of 16in. pipe. The total cost of the undertaking is estimated at £9260. The present price of gas at Lerwick is 7s. 6d. per 1000ft.

Mr. Edward Case, C.E., whose system of groyning is well-known, has recently died. He first came into prominence in 1890 in connection with Romney Marsh, the sea wall of which was then in a very dangerous condition. Between 1872 and 1890, £90,000 was spent in maintaining the wall, but the efforts were unsuccessful. Mr. Case then came forward with his system and there are now 170 groynes, varying from 350ft. to 1000ft. in length, and extending a total length of ten miles. The effect of this has been to raise the foreshore in some places as much as 8ft., and an average of 4ft. 6in. throughout.

Tramway Extensions at Manchester.—At a meeting of the Manchester Tramways Committee, held on August 26th, it was decided to recommend the council to obtain borrowing powers for the following purposes and amounts: £250,000 for the reconstruction of the permanent way, £150,000 for the overhead equipment, £360,000 for the purchase of 600 cars, £90,000 for certain lands and the erection of a car shed in Queen's Road, and £10,000 for other preliminary expenses. The total amount required up to now is £860,000, and this is but an instalment of the committee's ultimate requirements.

The Leeds Association of Engineers held their first meeting of the winter session last Thursday evening. An address was delivered by the President, Mr. Joe A. Tempests, in which, after alluding to the Association's improved premises, he congratulated members on the prosperous state of the engineering trade. Referring to the increase in the cost of raw materials, he expressed the hope that the demand for the finished product would justify firms in asking such advanced prices as would cover the extra cost of production. The President described the latest engineering industry introduced into the city by Messrs. Greenwood and Batley, Limited, viz., the manufacture of the De Laval steam turbines, turbine dynamos, turbine pumps, turbine fans, &c., for which purpose special works are being erected, having an area of nearly an acre entirely under cover.

Masters and Men.

Engineers at Le Creuzot, France, have struck. The following are their demands:—(1) Recognition of the Union by the Creuzot Administration; (2) suppression of sub-contracting; (3) liberty of conscience; and (4) moderation of the insulting language used by the overseers.

The Scotch Steelmasters' Association met last week in Glasgow, and decided that, considering that the price of pig-iron is at present the same as it was in July last when the men obtained an advance of 10 per cent. on their wages, a further increase was not warranted.

Navvies' Strike in Paris.—A strike has just been been declared among the men working on one of the most important branches of the new Metropolitan Underground Railway in Paris, that of Vincennes. The miners engaged in tunnelling operations made the first move, and the navvies have since thrown in their lot with them. The men ask for pay at the rate of 7½d. per hour, but the contractors only offer 6d., and are, it is stated, determined upon making no concessions.

The Newport Building Trades Dispute has now reached about the sixth month of its existence, having been commenced by the masters locking out the local plasterers in obedience to orders from London as long ago as the end of April. The offer of the masters to give an increase, dating from the 1st inst., has not led to any settlement, although efforts have been made in that direction. The block in the way is one of the rules as to the employment of free labour with union men. Over forty bricklayers and walling masons have left Newport for work in London, Manchester, Bristol, and elsewhere. Less than one hundred men of all ranks of the building trades now remain idle.

Proposed Amalgamation of Woodworkers' Unions.—An effort is being made to secure the fusion of the Amalgamated Society of Carpenters and Joiners' with the Alliance Cabinetmakers. The necessity of this course being adopted is shown by the fact that in many instances the work of cabinetmakers overlaps that of carpenters. Men of one class have been in the habit of accepting jobs at lower rates than their brethren in the other society. The Alliance Cabinetmakers have long been anxious to amalgamate, but hitherto difficulties have arisen which have proved to be insurmountable. A ballot is now being taken on the question, and it is hoped that the result will be made known next month. There are now four carpenters' societies, each overlapping the other in some way or other.

A Building Trades Conciliation Board has now been established. It will consist of fifteen members of the National Association of Master Builders of Great Britain and Ireland, and fifteen representatives of the Amalgamated Society of Carpenters and Joiners, the General Union of Carpenters and Joiners, the Associated Joiners of Scotland, the London Order of Bricklayers, the Manchester Unity of Bricklayers, the Operative Stonemasons' Society, the Operative Plumbers' Society, the National Society of Ship and House Painters, the Amalgamated Society of House Painters, the Amalgamated Society of Mill Sawyers and Wood-cutting Machinists, the United Builders' Labourers' Union, the Gasworkers' and General Labourers' Union, and the United Order of General Labourers. In addition to the representatives from employers and workmen, there are also to be district committees, the numbers to be decided locally. Disputes are at present in progress among joiners and carpenters at Hull, Halifax, Newport (Mon.), Londonderry, Oswestry, and Fleetwood.

The State of the Building Trade Dispute at Bristol has not changed since the men came out last Saturday week. Mr. Davis, secretary of the local branch of the Plasterers' Society, has made a statement concerning the position of the men. He states that when the lock-out occurred in March last, the men received a formal notice from the Master Builders' Association of Bristol, and they considered the whole of their working rules were broken. When the lock-out ceased on June 17th, he wrote to the masters on the 19th of the same month asking them to arrange a conference at the earliest possible date. Instead of granting that, the masters kept them about until the 6th of July. The plasterers had arranged to have a meeting, but that had to be put off, and at the last moment a notice came from the masters to the effect that they could not attend. When the men met them on 13th July they submitted a code of working rules, and asked for compensation, stating that they required a lump sum or a halfpenny per hour advance. The masters asked for a fortnight to consider the matter. This was granted, but it is said that no reply was received until August 25th, when the men received a notice practically declining to meet them, or to discuss the question. The men then gave them eleven clear days' notice. Eight days elapsed before they arranged to meet them at all, so that there was no alternative but for the men to give them the two hours' notice. Mr. Davis further stated that more than half the men were at work for non-federated firms, who had agreed to pay the men what they required, and that they hoped shortly to send away sixty men out of Bristol for employment elsewhere. On the part of the masters, it is asserted that the two hours' notice does not apply to a strike, but merely to the termination of employment in the ordinary course. The course the men should have followed is said to be defined in the fifth of the rules drawn up between the master builders and operative plasterers in May last. This rule reads as follows:—"In the event of a dispute arising on any job or works, the district officials of the N.A.O.P. shall send written notice to the local Association of Master Builders, who shall inform them whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the N.A.O P. until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen, with a view to an amicable settlement. Failing a local settlement, reference shall immediately be made to a central joint committee of the two associations, and until five days have expired from the date of this reference, no strike or lock-out shall be sanctioned either by the N.A.O.P. or by the National Association of Master Builders." With regard to the alleged refusal of members of the N.A.O.P. to work with workmen who may not belong to a trade union, it is understood that the men the operative plasterers object to work with are defaulters and other men who have been shown to the employers to have made themselves specially objectionable to the union men.

Hull Building Trade Dispute—Another attempt is to be made to settle this dispute, which has now been continued for over thirty weeks. Last Wednesday a conference was held between the Hull Master Builders' Executive and representatives from the respective operative societies, under the presidency of Mr. W. G. Bray. The employers submitted the following new proposals for a settlement:—

1. That all men return to work on the old rules. 2. That a joint board of conciliation be formed, consisting of an equal number of employers and employed, and that any difficulties, both present and future, shall be dealt with by such board prior to any stoppage of work. The board to be called together within forty-eight hours of any dispute occurring. It was mutually agreed that the proposed terms of settlement be forthwith brought before the members of each interested association, and a vote (for or against) taken. There is good reason to believe that these terms

will be accepted by the men, and a speedy termination of the unfortunate dispute will take place. The proposals now put forward by the masters that the men shall return to work on the old terms is practically a concession of the principle that the men have been fighting for. With the exception of the joiners, who asked for an extra halfpenny per hour, which the masters on several occasions have expressed their willingness to grant, the dispute has all along had its foundation in the proposed revision of rules, the principal one of which was that unionists should agree to work amicably with non-unionists. There were other points as to starting places and walking delegates, which were, however, of minor importance compared with the other proposal, which the men, who embrace all branches of the building trade, have successfully resisted. The continuance of the dispute has only rested with the local Master Builders' Association for some six or seven weeks past, since the Yorkshire Federation decided to withdraw their lock-out notices, this action of the federation causing the dispute to be localised. Hull being left to fight its own battle. It has been arranged that the ballot of the joiners on the new proposals shall be taken to-morrow, and of the bricklayers to-day, at the St. George's Hall, Hull. The struggle has cost the joiners about £1,500 and the bricklayers between £2,000 and £3,000, whilst many works, both public and private, have been stopped.

Trade and Craft.

WELSBACH GAS FITTINGS.

The Welsbach Incandescent Gas Light Co. ave last week at their showrooms, York treet, Westminster, an exhibition of their ew goods for the coming season. There was most bewildering collection of all manner of lain and ornamental brackets and chandeliers uitable for all classes of houses. Perhaps he most noticeable amongst them was the ew "Surprise Pendant," which can be moved any direction, and which when fitted with n ornamental silk shade has a charming soft fect. These pendants have recently been troduced by the Prince of Wales into andringham House. There was also on xhibition an ingenious arrangement known the Automatic Gas Lighter, which dispenses tirely with the use of matches and tapers r lighting, and is therefore most invaluable minimising the risk of fire. It can be fitted any of the Welsbach burners, and by its e the gas can be switched off and on conveniently as electric light. Its use o allows the Welsbach burners to be hted without explosion, and so increases the life of the mantle. Another novelty was the Anti-Vibrator Burner, which has been adopted for use where there is a heavy traffic. By the fixing of a spring inside the burner no amount of vibration affects the mantle. Hitherto the Welsbach fittings have been used almost entirely for gas, but they have now been adapted to oil lamps, and in the "Era" lamp a most brilliant effect is obtained. It is claimed for this lamp that a light of fifty candles can be obtained while consuming only one-third of the amount of oil of an ordinary lamp giving the same light, besides throwing off less heat. We are informed that the goods of this company are coming more and more into general use, and each season shows an increased demand.

FIREPROOFING AND SOUND-PROOFING.

Of late years a very healthy interest has been shown in all methods of fire prevention in buildings and in appliances for the protection of life. The rapid decline in the partiality for concrete systems has induced Messrs. Frederick Jones and Co., the Silicate Cotton and Plaster Slab Works, Perrin Street, Kentish Town, N.W., to place before the architectural world a few facts concerning their patent British-made silicate cotton. These facts are contained in an interesting little pamphlet entitled "Fire-Proofing and Sound-Proofing," which says that silicate cotton, or "slag wool," is a pure mineral fibre, blown from slag or other vitreous substance of a similar nature. The work enumerates the principal virtues of silicate cotton, which is one of the finest non-conductors of heat, cold, and sound. It is perfectly sanitary, as it does not contain anything which will assist in generating or harbouring vermin. The fireproof qualities of this material are well known. In conjunction with plaster it forms an excellent protective jacketing for iron girders, &c., and for rendering ceilings fireproof. Messrs. Jones, who, besides their works in London, have depots at Manchester, Leeds, Middlesbrough, Newcastle-on-Tyne, Glasgow, and Swansea, will be glad to furnish samples of, and further particulars concerning their patent silicate cotton upon application.

ARMOURED FIREPROOF DOORS.

Until 1895 the Associated Fire Insurance Offices of the United Kingdom, and even the various Building Acts stipulated that all fireproof doors must be constructed of wrought iron; but experience proved that such doors were only partially suited for fire-resisting purposes, as, when under a fire test, owing to unequal expansion, they invariably "buckled," and sometimes tore themselves away from their hangings, thus allowing the fire to get through the door openings, and not preventing its spread. By a circular dated April, 1895, however, the British Fire Offices officially recognised armoured timber fireproof doors, and practically stipulated that in cases where a fireproof door is to slide from side to side, it must be of this construction, and not of iron at all. The idea of constructing fireproof doors of timber originated in America, and Messrs. Dowson, Taylor and Co., the proprietors of the Grinnell Automatic Sprinkler, are the manufacturers in this country of the patent self-closing armoured fireproof doors. These doors are constructed of two, three, or four thicknesses (according to the area of the opening) of well-seasoned pine boards, planed, tongued and grooved, and nailed together with wrought iron nails, driven flush, and clenched on the other side. They are completely covered with tinned steel sheets, put on in such a manner that whilst free to expand they exclude the air and cannot become detached. By excluding the atmosphere from the wood, combustion is prevented, and an exposure of several hours to the flames only results in the timber becoming carbonised to the depth of a fraction of an inch; in fact, at a fire at the works of the Anaglypta Company, Limited, at Darwen, although the iron girders forming the roof were bent and twisted into all manner of shapes, and the roof fell in, an examination of an armoured door which had been manufactured by Messrs. Dowson, Taylor and Co. showed that the wood had been simply charred to a depth of about one-eighth of an inch. In several other instances have the armoured doors of this firm effectually excluded the flames. The armoured doors are less than half the weight of iron ones, and when fitted with the frictionless pulley hangers, supplied by the firm, they run along the rails with the greatest freedom. Sliding, hinged, or folding doors are supplied, if required, fitted with the patent automatic apparatus for self-closing in case of fire. The London address of the firm is 14, Victoria Street, S.W. They also have offices in Manchester, Leeds, Glasgow, and Birmingham.

A Bust of François Chabas, the eminent Egyptologist, has been erected in the new public gardens at Chalsu-sur-Saône on an obelisk appropriately decorated with hieroglyphics and a crouching sphinx. Curious to relate, this great Egyptologist never went to Egypt, his only excursion abroad being that to some Italian museums in 1869.

The Proposed Purchase of Dollis Hill.—Colonel A. C. Smith, Local Goverment Board Inspector, has held an inquiry into the application made by the Willesden Council, London, N.W., for sanction to borrow £50,000 for the purchase of the Dollis Hill Estate, which it is proposed to utilise as public parks and pleasure grounds.

WORSHIPFUL COMPANY OF CARPENTERS.

LECTURES ON SANITARY BUILDING CONSTRUCTION

In connection with an Examination to be held at Carpenters' Hall on NOVEMBER 30th and DECEMBER 2nd, will be delivered as follows:—

Date, 1899.	Lecturer.	Subject and Synopsis.
Thursday, Oct. 12th	Professor T. ROGER SMITH, F.R.I.B.A.	**Site, Foundations, and Sanitary Requirements.** What is needed to make a Building a healthy one. Sanitary precautions as to Healthiness of Site and the sufficiency of Air Space about Buildings, Light, &c. Construction of Foundations, especially when the bottom is bad or under water.
Thursday, Oct. 19th	Professor HENRY ROBINSON, M. Inst. C.E.	Sanitary Arrangements of Buildings, the construction of Water Closets, Privies, and Dry Closets, Water Supply, Water Tanks and Services, and Plumbers' Work. The Essentials and Details of Good Drainage; the various kinds of Pipes, Pipe Laying; Ventilation of Drains and Testing of Drains; Dealing with old Drains.
Thursday, Oct. 26th	THOMAS BLASHILL, Esq., F.R.I.B.A.	**Sanitary Construction, Warming, and Ventilation.** The Properties and Qualities of Building Materials and modes of using them. Timber: its decay and preservation.
Thursday, Nov. 2nd	KEITH D. YOUNG, Esq., F.R.I.B.A.	Principles of Ventilating and Warming Buildings.
Thursday, Nov. 16th	JAMES BARTLETT, Esq., M.S.A., Demonstrator, King's College.	**Setting Out Work and Bye-Laws.** Principles of Calculating Areas, Cubic space; Interpretation of Drawings to Scale; Methods of Setting out Work, Checking Levels. Knowledge of the Acts of Parliament relating to Buildings. The Model Bye-laws issued by the Local Government Board, so far as they relate to the subjects of the Examination.

These Lectures are primarily intended for Candidates for the present or future Examinations, and are Illustrated by Take-to-pieces Models, large Diagrams, Photographs, and Specimens of Materials.

Lectures commence at 7.30 p.m.

Entry Forms for the Examination, Tickets for the Lectures, and all particulars can be had from

S. W. PRESTON, Esq.,
Carpenters' Hall, London Wall.

PARTNERSHIP (active or sleeping) required, to take HALF SHARE in High-class JOINERY MANUFACTORY, situate in the Midlands. Capital required about £1,500. A gentleman who could influence trade and manage a London branch preferred. Or would suit a London Contractor, where low rates, rent, and wages would be an inducement to have a separate branch for Joinery Manufactory. Principals or their solicitors only treated with.—Apply, "Solicitor," Box No. 1192, Builders' Journal Office. 1

APPOINTMENTS VACANT.

PUPIL.—Old-established firm of Architects and Surveyors has VACANCY for well educated youth as Articled Pupil. Immediately under principals. Moderate premium.—Hukins and Mayell, 76a, Westbourne-grove, London, W. 1

TO ARCHITECTS.—An Architect in good practice in Belfast WANTS a JUNIOR PARTNER.—Address, "A. Z.," care Eason and Son, Ltd., Belfast. 1

TO IMPROVERS.—An A.R.I.B.A. by Examination, residing in South London, is willing to BOARD and DIRECT the EVENING STUDIES of an ARCHITECTURAL STUDENT proposing to sit for the Exams.; must be engaged during the day; facilities for study (including use of most of the books required) afforded.—Apply, Box 1189, "Builders' Journal" Office. 2

YOUNG ARCHITECT, with Central Offices, wishes to MEET ANOTHER to join in Competition Work.—Apply Box 1194, "Builders' Journal" Office. 1

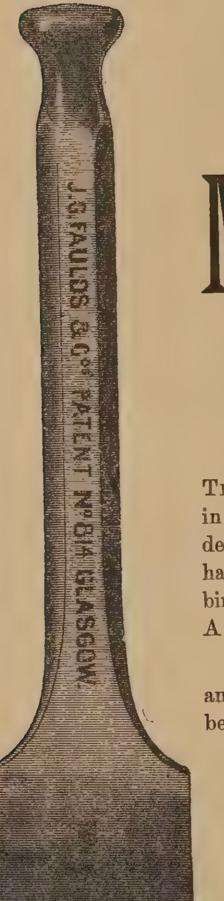
J. G. FAULDS'

IMPROVED

Multiplex Stone-Cutter.

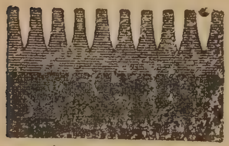
Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.



J.G.FAULDS & Co PATENT No 814 GLASGOW.

2" Drove, showing Cutter in Slot.

Double Toothed Cutter.



Reversible Cutter, with "Drove" Edge out.

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

Continuation of **Specification.** *Architect.*

The concrete foundation for the shaft is to be 38ft. square and 10ft. thick, laid perfectly level. Should the Engineer think fit either to increase or diminish the dimensions of the concrete foundation or excavations such variation will be measured and valued at the schedule rates of prices to be filled in by the Contractor at the end of this Specification.

Cement Concrete.

The cement concrete shall be composed of washed or clean sharp sand and *clean* screened gravel ballast or broken stone and Portland cement in the proportion of 1½ parts of sand and 4½ parts of gravel ballast or broken stone by measure to 1 of cement. As previously specified, if sand and gravel be obtained in excavating for the foundations, so much of it as is approved by the Engineer may, after being washed and screened to his satisfaction, be used in making the concrete.

Broken stone.

The broken stone to be used in the concrete must be hard clean stone that will break into cubical forms, and not into flat, flaggy, or flaky shapes, and all dirty, soft and earthy stones must be thrown aside and removed from the works. No stone or fragment of stone is to be used which will not pass all ways through a 2in. ring, or which will not be retained all ways by a ¾in. ring.

Gauge boxes.

In preparing the concrete the proportions are to be accurately guaged in suitably constructed wooden guage boxes, and is to be mixed on clean timber stages or bankers in quantities not exceeding one cubic yard at a time, and deposited in layers to proper levels.

Mixing of concrete.

The sand and cement shall be turned over three times in a dry state, when the broken stone or gravel ballast shall be added, and the whole mass shall be turned over sufficiently to insure a proper mixture of the gravel ballast or broken stone with the sand and cement before water is added and again turned over as often as may be necessary to mix the materials thoroughly together, and such concrete must be deposited as quickly as possible after mixing in its intended position in the Works in regular layers.

Laying concrete.

The concrete is not to be dropped into the excavation, but it is to be shot down a wooden shoot, the lower end of which shall not be more than 3ft. above the surface upon which the concrete is to be laid.

The concrete is to be deposited in layers 9in. in thickness, to be well rammed and carefully levelled and finished with a fairly uniform surface at each layer. After the laying in of the concrete has been commenced it shall be followed on with continuously throughout the day, and the concrete last placed in the foundations shall not be allowed to set before the next layer is added, in order that the whole block of concrete may thus be keyed and bonded together. At the end of each day's work the layer of concrete last laid in is to be left perfectly level, but with a deeply corrugated surface, so as to form a key for the layer next to be added upon resuming work. Before putting in a new layer upon the layer last laid on the previous day, the old surface shall be thoroughly well moistened with water and a brush, so that the new material shall properly adhere.

The finished surface of the concrete is to be made perfectly even and level to receive the brickwork foundations.

The Contractor is to provide all profiles, close plankings, etc., required to keep the sides of the concrete vertical, and to remove same when the concrete is properly set.

MORTAR.

Lime Mortar.

The mortar for the brickwork is to be composed of one part of fresh well burnt blue lias lime, measured before slacking, to three parts of best *clean sharp* sand free from all impurities.

The lime is to be brought direct from the kiln in such quantities only as may be required for immediate use.

The lime mortar is to be prepared upon the site of the works in a mortar mill. The lime and sand are to be thoroughly well mixed, and incorporated with a sufficiency of water, and to be of a tough consistency.

The mortar is to be used perfectly fresh, and no mortar will be allowed to be used in the works which may have been mixed on the previous day.

Cement Mortar.

The cement mortar shall be composed of one part of Portland cement to two parts of *clean sharp* sand accurately gauged by measure; to be well and evenly mixed together, care being taken not to put too much water to the mortar while mixing. The cement mortar must be used fresh, and none that has commenced to set will be allowed to be used.

SAND AND GRAVEL.

The sand and gravel to be used in the work for mortar grout or concrete, shall be sharp and washed thoroughly clean in a suitable washer constructed for the purpose, and shall be washed until they are entirely free from impurities or foreign substances.

BRICKWORK.

General Work.

The whole of the bricks for the general work throughout are to be good, sound, approved, hard, properly burned square, ringing stocks, of approved manufacture, and equal to a sample which may be seen deposited in the offices of the Engineer and Surveyor to the Council, at the Town Hall, Leyton.

Facings.

The facings are to be of the best quality, handpicked pressed reds, equal to a sample deposit as above.

Angle Bricks.

The octagon is to be maintained internally and externally with purpose made angle bricks.

Octagonal Brick Quoins.

The quoins of the outside angles of the octagon are to be special made pressed reds as described above for facings equal to a sample deposited as above.

Blue Bricks.

The blue brick cornices, string-courses, quoins, and plinths are to be of Staffordshire pressed blue bricks of the first quality of approved manufacture, and equal to a sample deposited as aforesaid.

The blue bricks for the quoins in base and plinth are to be "bull-nosed," and a blue brick plinth course 1ft. in depth, and splayed at an angle of 45deg. is to be fixed as shown.

Bricks to be approved.

The Contractor shall obtain all the bricks from approved yards, and any bricks brought upon the works not of the first quality of their respective kinds, and not satisfactory in all respects to the Engineer, will be rejected, and must at once be removed by the Contractor and others substituted of approved quality.

Before commencing to use any bricks the Contractor must first submit fair samples of each class to the Engineer at his office, and must obtain his approval of such, before commencing the use of same upon the works.

All bricks shall be carefully handed from the carts and stacked, and no broken bricks or bats are to be brought upon the ground.

Watering Bricks.

The whole of the bricks are to be totally immersed and well saturated with water, in tubs provided for the purpose. The tops of the walls where left off are to be well wetted before recommencing them, and as often as the Engineer may deem necessary.

The whole of the brickwork throughout, including footings, walls, arches, string courses, cornices, etc., is to be built and carried up in accordance with the drawings, and is to be of the various thicknesses, heights, etc., or other dimensions as shown thereon, finishing at the top length of 19ft., which is to be 1ft. 2in. in thickness and is to be set in Portland cement mortar.

Bond.

All brickwork except where otherwise specified is to be built in lime mortar and in old English bond.

All the walls are to be carried up uniformly all round and no part is to be left more than 3ft. lower than any other. Each course is to be carried up to a uniform level throughout, and the whole of the work is to be built true and the perpends strictly kept.

Two arched openings are to be formed (6ft. by 9ft.) in the base of the shaft, as shown, for the connection of the main flues thereto. The semi-circular arches over openings to be turned in three 4½ rings of brickwork carefully bonded in mortar and lined with fire brick.

Form sunk panels in each side of the square pedestal base of the dimensions, and after the manner shown upon the drawings.

Granite Tablet.

Provide and fix, as shown, in one side of the base a well-polished approved Aberdeen granite tablet (approximate size 7ft. by 5ft. 8in.), not less than 6in. in thickness, and properly build in same as shown on the drawings.

A 3in. cast iron pipe (water main strength), with a screw hexagonal cap and spanner, is to be placed through the brickwork in the position shown upon the plan, for the purpose of inserting testing apparatus, &c.

Two blue brick cornices are to be constructed in the topmost 19ft. length of the shaft, and are to be of the depths and projections shown upon the plans. They are to be thoroughly well bonded together and set in cement, and if considered necessary by the Engineer are to be further secured with metal cramps run in with lead.

In the topmost length of the shaft, and between the two projecting blue brick cornices above mentioned, five projecting ribs are to be formed of facing bricks on each side of the octagon, as shown on the drawings. These ribs are to be spaced 4½in. apart in the clear, are to be 4½in. in width on the face, to project 3in. from the face of the shaft, and are to extend 9ft. in length. They are to be properly corbelled out at the bottom and finished at the top with splayed blue bricks. All to be set in Portland cement mortar.

Jointing.

The brickwork is to be built with neat close joints not exceeding ¼in. in thickness, and no four courses of

An Architectural Causerie.

Esher Old and New Churches. ESHER is attracting some attention just now, by reason of the proposals of the vestry to sell some landed property owned by the church, property which, according to the delicate, but somewhat tardily-awakened, conscience of the inhabitants, it is scandalous that the Church should derive any benefit from. It seems that what is still known as the "new" church of Esher, a large and imposing edifice built in 1852, was erected from funds which had accumulated from the rents of a large piece of land bequeathed to the church nearly three hundred years ago. This land has long formed the greater portion of Sandown Racecourse, and the proposals of the Vestry, which, of course, require the sanction of the Charity Commissioners, are to sell the land outright for £12,000, and with this sum to purchase two and a-half per cent. annuities. It is a singular fact that the land bequeathed so long since by an inhabitant of Esher was once the site of the quite vanished Priory of Sandown, which would appear to have never been revived after the Prior, with all the brethren, perished in that great pestilence, the "Black Death," which swept over England in the Middle Ages.

There is some unconscious humour in this attempt of the Esher church people to remove what they consider to be the stigma attaching to their ownership of so ungodly a thing as a racecourse. They are unwilling to bear the discredit of it, but not unprepared to retain the monetary advantage. How disingenuous, this shuffling!

The church, built forty-eight years ago, is worth seeing, if only for the Royal Pew, designed to accommodate the royalties of Claremont, overlooking the chancel, high above the heads of the common herd in the body of the building. Even in the House of God is pride of place made to assert itself. The proper corrective of this ostentation and pomp is seen in the humble old church, hidden away behind that old coaching inn, the "Bear," on the other side of the village street. Closed now for nearly half a century, it is only used as a mortuary chapel, and is given over to spiders, dust and decay. The interior of this little building is rendered theatrical by the mouldy old Royal Pew built on the south side, and looking very much like a box at the opera. It was built for Princess Charlotte and her husband, who lived at Claremont for a very brief period at the beginning of the century. The Princess Charlotte was the only child of George IV., and had she lived would in due course have become Queen of England, instead of the Princess Victoria. But she died in 1816, and Claremont was deserted and the Royal Pew here unoccupied. In its dusty and threadbare state, and thickly covered with cobwebs, it preaches an eloquent sermon on the fleeting nature of earthly pomps. The addition made to the south side of the church for the purpose of building this pew and a separate entrance to it, apart from the way by which the plebeians came to worship, is seen in the accompanying sketch.

C. G. H.

ESHER OLD CHURCH. DRAWN BY C. G. HARPER.

The Avatar of a "Sky Scraper." THE life of the big iron tower that, for the past ten years, has been the principal landmark of Paris to countless thousands of tourists, has been in serious jeopardy of late, not from any insidious internal malady, but by reason of the open attacks of many resolute and well-armed enemies. If it has succeeded in escaping destruction, it may be said to have been almost literally by the skin of its teeth, since to obtain a respite it has had to doff its coat of red and assume one of yellow instead. It was not only the artists, who, on the ground that the continued presence of the tower formed a permanent insult to the people who cherish the "cult of the beautiful," made an onslaught on this materialisation of one of the most grandiose dreams engineer ever had. Arguments appealing far more directly to the vulgar were brought forward by the score. "Leave the tower," chorused in unison architects and builders, despairing of ever surpassing M. Eiffel, "and the Exhibition of 1900 will be but a second edition of that of 1889; everybody's nose will be tip-tilted in the air as it was then, and none of our more lowly *chefs d'œuvre* will receive so much as a glance or, what is perhaps more important, a franc. If it cannot be torn limb from limb as it deserves, let it at least be changed out of all recognition! Alter its shape; cut its head off; lay it on its side; humble it in the dust. Make a tunnel of it, a bridge, a telescope, an aqueduct, what you will! Don't leave it as before."

The tower heard and trembled, as did all its friends scattered over the two hemispheres. It is not for nothing that a particular spot has been one of the favourite pilgrimages of half the well-to-do honeymooning couples in the world, and many a fond souvenir is cherished of the day when *he* and *she* "lost," as a story-writer might say, "'twixt earth and heaven, but strong in each others' affection," looked over the balustrade at the panorama spread out far down below. The tower has won many suffrages also by the liberal policy adopted by the management of tolerating the exercise of some of the most deep-rooted instincts of sight-seeing humanity. So long as the plate-glass windows of the lifts are respected, the visitor, whether he be named John Smith, of London, or Ivan Ivan, of Moscow, may scribble, carve, or paint as much of his family history and private sentiments as he considers will interest subsequent visitors, where he will, or rather where he can. In spite of all these sympathisers, however, the tower was anxious. Philosophers, who, it must be confessed, have very often little or no practical experience of what they preach, declare that the wise man in his prosperity does not tempt Providence by too insolent a parade of his wealth. If possible, envy and jealousy should not be aroused at all; at any rate, they should be conciliated if their presence is unavoidable. Whether right or wrong, these counsels have been adopted by the Eiffel Tower in its hour of danger. After long casting about to discover the best way of making itself as little conspicuous as was consistent with a modicum of self respect, it has borrowed a hint from the chameleon, which, in order to escape detection by its enemies, assimilates its hue as far as possible to that of its background.

The chameleon, however, knows instinctively what colour will best serve its turn while the Eiffel Tower, the first of its species, has no instinct to rely upon but that of self-preservation. The consequence has been that, for several weeks, it presented but a sorry spectacle, experimenting first with one colour and then with another. The only thing clear was that the old fiery red would not do. Now the tower was daubed all over

ESHER CHURCH. BUILT FROM THE RENT OF A RACECOURSE.

with sky-blue, now its nether limbs were as white as the fleecy clouds, now as grey as the river—anon yellow. It is the last colour that finally carried the day, and for some weeks the Eiffel Tower has been clad in a mantle of "degraded" yellow. In order still further to avoid diverting attention from the stucco palaces that cluster round its base, the lower parts of the tower have been painted a very dark shade, the colour gradually becoming lighter and lighter as the summit is approached. After nightfall, however, the tower will have its revenge, for its contour will be outlined by scores of lights. To paint such a structure as the Eiffel Tower is no easy task. The exact number of miles all the girders would stretch to if placed end to end, he whose soul hungers for such details may find clearly set forth in various guide books. It may be more to the point to say that considerably over fifty tons of paint were employed, and the work took over four months. In spite of everything, the Eiffel Tower, even in its "degraded" yellow dress, bids fair to be head and shoulders above all its many competitors for public favour next year. A. A.

"Renaissance."

Mankind, said a famous statesman, are "the slaves of words and phrases." Perhaps there is no word more abused than "Renaissance." The revival of classical learning in Italy led the Italians to revive the classical Architecture, subject, however, to some important modifications, and this, together with the changes of subjects and treatment in sculpture and painting, is collectively known as the Renaissance. In Italy the great masters in art aimed, on the whole, at preserving the dignified simplicity of the ancient designs. So long as the system was confined to Italy it was shown to be suitable to the climate and people of the country; the same could not always be said of it when it had once crossed the Alps.

Beautiful, indeed, as are the French chateaux of Francis the First's time, designed under the influence of Serlio and Primaticcio, quaint as are the buildings of the Low Countries and northern Germany, we can yet understand the reluctance of our forefathers absolutely to give up Gothic. The Italians in their Renaissance were mainly reverting to a national style long forgotten or overlaid by an invasion of Gothic from the north; the northern nations were attempting to adopt Classic forms to Gothic designs. Sometimes the combination resulted in a thing of beauty, but sometimes also in failure, particularly when the columns and architraves of the ancients, carefully designed upon an elaborate system of proportions and corrected by subtle curves, were taken, altered, mutilated, and made to fit as details of northern buildings. A general loosening of architectural conventions began to prevail; inconsistency and incongruity are often found in the works of this period. In our own day the word has become a pitfall for the unwary public, and suburban builders of villas and "high-class" blocks of shops and flats decorate their incongruous creations with odds and ends taken from every known building in Bruges, Amsterdam, and Bremen, gables from Antwerp, œuil-de-bœuf windows from Fontainebleau, and pilasters from Heidelberg. To all criticism as to fitness or harmony there is but one answer vouchsafed, "Renaissance." Yet if the best of the artists who began the various innovations and combinations of that time and founded the national styles of modern Europe in so doing, could speak, they would tell us that the last thing they had in their minds was to interfere with the great harmonies of Architecture by deluging it with a mass of ill-assorted detail. J. C. P.

On Reflection.

The South African Architect.

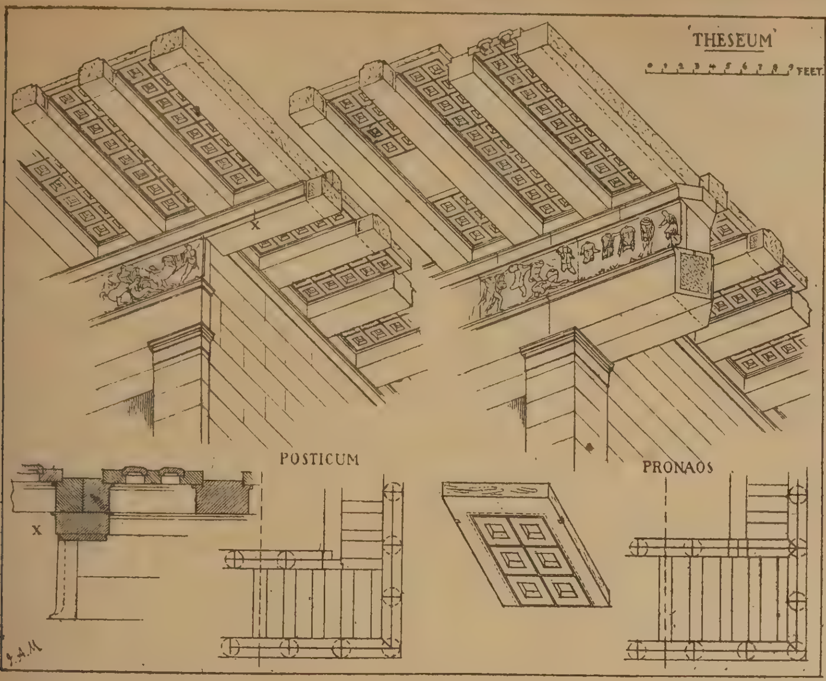
For the past month or so the dread cry of war has been dinning in our ears, now screeching loud, now comfortingly moderated, fitful as a wave; and by the time these words reach our readers, hostilities may have actually commenced. Everybody connected with South Africa has been more or less affected by recent events, and, amongst these, we must especially include those fellow countrymen practising as architects, contractors, engineers, and others similarly employed. These men, and their predecessors, have had a very large share indeed in the building up of the colony. The gold and the diamonds were, of course, the primary power, but the men referred to were those who developed the effects of that power. Johannesburg is an example. This has been called the "city of light heart and open hand." It was not always so. It was rather different from that in 1887, the date of its foundation. At the present time its big edifices are still standing, but the streets present a mournful spectacle, and all building and engineering operations are stopped. Johannesburg grew with amazing rapidity, then slackened its pace a little, and during the last three years has been nearly at a standstill. Some time ago the officials of the great companies, the mining engineers, and almost every educated and expert workman in a position of trust, could obtain a yearly salary which ran into four figures. Nearly one third of the inhabitants of Johannesburg were earning incomes of about £400 a year. A house worth £300 a year a few years ago could this year have been obtained for £120. The building boom came to an end even before the outbreak of the present troubles. Valuable sites were desolate, and near the railway station yawned the excavations for a projected grand hotel. But the war scare and its attendant evacuations have widened the abyss, and there is no saying that Johannesburg *in toto* may not be swallowed up in it. Architects in this country in the midst of a flourishing connection may well sympathise with those whose practice is—until South Africa is again quiet—completely ruined.

A Labour of Love.

Enthusiasm is the power that carries everything before it. Without it obstacles look mountainous; with it they become as mole hills. And for a good example one should pay a visit of inspection to a site a little outside Northampton any Thursday or Saturday afternoon. It appears that a new edifice called Christ Church was opened in the district about a year ago, the work of which has so developed that the present accommodation is inadequate and the congregation are badly in need of a new Sunday school and parish room. They were obliged to get additional accommodation in some way or another, and as they found that they could not afford to pay for the erection of a new building they decided to save the cost of labour and to build it themselves. Now everyone is not of such a practical turn of mind, nor possesses the same zeal as these worthy people. The firm of contractors who built the church seem to have caught the spirit of their would-be clients, for they very generously offered to supply the necessary materials at cost price. This was not all. Among the congregation there is an architect. He prepared the plans for the new building without charge. Nothing could be better, and on the afternoons mentioned the site is now covered by the busy workers, and "gentlemen well-known in the business circles of Northampton" may be seen strutting about with hods on their backs! Such work as can only be done by skilled artisans is done by bricklayers belonging to the church, while the less skilled portion is engaged in operations which, had they been told of it years ago, would have startled them exceedingly. The joiners of the congregation will soon be at work. Meanwhile everything is proceeding merrily. Whilst not advocates of anything that may approach unworkmanlike building, we think that, in the present circumstances, the members of Christ Church are to be congratulated on the practical way in which they have solved their difficulty. When clergymen find that additions are needed to their buildings and funds are short, it is usual for a bazaar to be held, at which people are induced to pay very excessive prices for things. This is a new method, which reminds one of the well-known case of the Cumberland clergyman and his daughters who built their rectory from bottom to top. Another vicar has recently been following their example by painting his schools himself, as money was short. It is a fitting conclusion to say that, in the building operations now going on outside Northampton, the vicar of the church and the master of the grammar school are the two most conspicuous workers.

Ladies as Sanitary Inspectors.

In some cases good results have followed on a man's vocation being adopted by a woman; in other cases the reverse has happened. But the appointment of lady sanitary inspectors, for some purposes, must be admitted to be a beneficial reform. The chief duties of a lady in this position would be to look after the women and children in her district, to give instruction to them, and to see that sanitary conditions were conformed with. Such work it would be impossible for a man to accomplish with the degree of success attained by a lady inspector. The Liverpool Corporation now employs eight lady sanitary inspectors to look after those who live in the slums and poorer parts of the city, and at the recent Health Congress at Blackpool the Medical Officer of Liverpool spoke highly of the work they had done. An expression of opinion of this kind, given after practical experience, is worth all the talk of those who cannot speak from such experience. At the same congress a paper was read by Mrs. Redford on the work of the Women's Health Society, which was started about forty years ago in Manchester and Salford. Nine out of the sixteen Health Visitors at Manchester are paid by the Corporation, while the Salford Corporation also pays for four. The work of the lady sanitary inspector has its chief results in the lowering of the death rate, which is accomplished by a careful supervision of the various homes. This is a great work in itself, but, in addition, the health of the community, as a whole, is improved by such efforts, and it is to be hoped that in the future the position of the lady sanitary inspector will be thoroughly appreciated, and her work responded to. The more general employment of tactful and properly qualified women as sanitary inspectors would, we are convinced, be an important factor in raising the health standard of the community to the highest possible level—an object which it ought to be one of the chief anxieties of every municipality to achieve.



WITH GREEK BUILDERS.

By JOHN A. MARSHALL.

(*Continued from page* 121, *No.* CCXLII.)

V.—THE STONE CEILINGS OF PERIPTERAL TEMPLES.

"AN account which I received from Aristarchus, the Interpreter of Antiquities at Olympia, I must not omit. He said that in his youth, when the people of Elis restored the roof of the temple of Hera, the body of a dead man in heavy armour, who had been badly wounded, was found between the sham roof and the roof on which the tiles lay. This man was a combatant in the battle fought inside Altis, between the Lacedæmonians and the people of Elis. For the people of Elis climbed up to the temples of the gods, and all high buildings alike, for the purpose of defence."

From this statement by Pausanias, who visited Olympia in the middle of the second century A.D., it seems clear that in the early part of the fourth century B.C. the Heraion at Olympia had a horizontal ceiling, apart from the pedimental roof; and it is considered highly probable that this roof and ceiling, superseded, in the seventh or sixth century B.C., a flat roof covered with sun-burnt bricks.

It is noteworthy that the earliest stone ceiling found by the Germans at Olympia was that to the peristyle of the Philippeion, a circular building, erected at the close of the Hellenic age. Nearly all the other buildings, including the Heraion, the great Temple of Zeus, and the Metroon, with their outer colonnades and vestibules, had ceilings of wood throughout.

Generally, in Greek temples of the ordinary type, the wood ceiling was limited to the naos; while the pronaos, the epinaos, and the peristyle, which were exposed to the outer air, had ceilings of stone.

For rectangular compartments, such as the porticoes of the Propylæa and the Erectheion, the arrangement of the beams to support the lacunaria was a very simple matter; but for the outer circuit of Doric peripteral temples it was necessary to resort to some expedient at the angles by which the ceilings at the ends and flanks could be treated independently. In front of the pronaos and epinaos the ceiling was usually continued across the flanks, so as to occupy the full width of the building, and, in the case of the front portico, the separation from the flanks was marked by extending the architrave and frieze of the pronaos to the columns of the peristyle. To meet this requirement it was essential, in setting out the plan of the temple, that the columns and antæ of the pronaos should be placed on the axis of one of the columns on the flanks, in order that the architrave might be received by the abacus of the cap. Generally, this column was the third from the angle, so that the peristyle at this end had somewhat the appearance of a spacious and independent portico.

The Theseum and the temples at Assos, Sunium, and Rhamnus are examples of this arrangement.

At the back of the temple, the architrave and frieze of the epinaos were always stopped at the antæ, and to disconnect the ceiling from the flanks, only the moulded band on the top of the frieze was carried across as a beam. The position of this beam in relation to the columns of the peristyle was not important, seeing that it was placed so much above the level of the caps. Still less was it essential that the ceiling beams should be placed over the columns, although it seems to have been an invariable rule to place one over the central intercolumniation. In Ionic temples, where the ceiling beams rested on the architrave, and were placed over the columns, the antæ of the pronaos and epinaos were placed on the intersection of the axes of the second columns on the ends and flanks. The ceiling beams over these columns thus formed a square compartment at the angles of the peristyle, and the ambulatory was, of course, the same width all round, as at the Temples of Teos and Priene, and probably the Mausoleum. For large temples of the Ionic type, the porticoes were increased in depth by introducing additional rows of columns, but the various colonnades were kept a uniform distance apart, so that the ceilings formed a number of square compartments, coinciding with the intercolumniations.

A few examples may now be described in detail. *The Theseum.*—Here the architrave and frieze of the pronaos are continued across to the third column on the flanks of the peristyle. For the epinaos, the architrave and frieze are stopped at the antæ, and merely the moulded band on the top of the frieze is carried across to take the ceiling beams of the portico. This band being only 8in. deep, an additional thickness is given to that portion which spans the ambulatory, and this extra thickness is notched on the slabs of the sculptured frieze, in a way that seems to indicate an afterthought. (See the casts in the Museum.) The return face of the antæ, unlike that of the pronaos, bears no definite relation to the beam over, but simply serves to stop the mouldings of the cap and architrave, the latter having a projection worked on the return end with this object.

The ceiling beams are 1ft. 8in. wide, about 12in. deep, and 2ft. 9in. apart; the bearing for the front portico is 12ft. 9in.

In setting out the ceilings of the porticoes, a beam is placed, as usual, next the peristyle on the flanks, probably from æsthetic motives, but which also resulted in the practical advantage of keeping the lacunaria stones clear of the roof timbers.

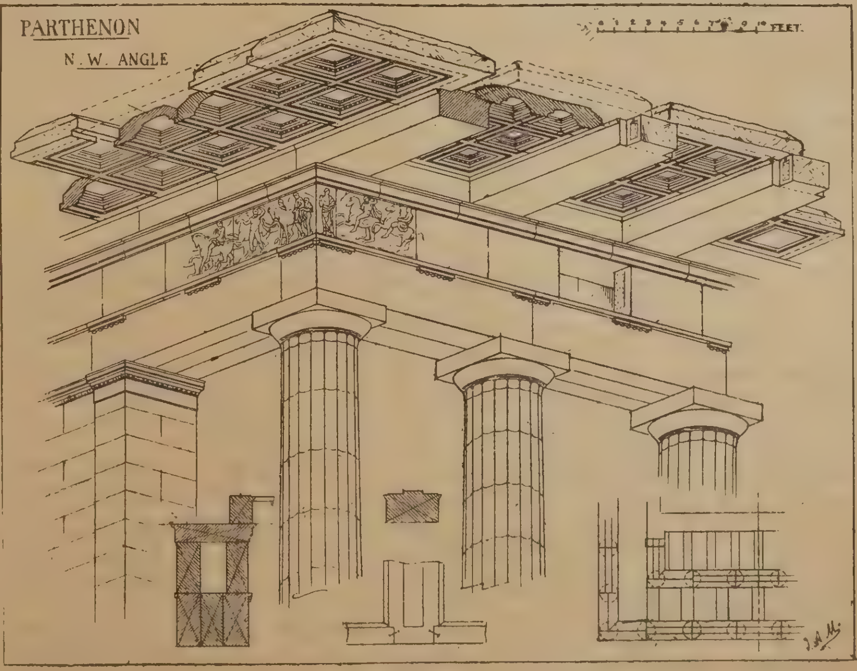
For the rest of the ambulatory, a rafter could be placed in the spaces between the ceiling stones, while every other rafter would probably have to be notched over the latter.

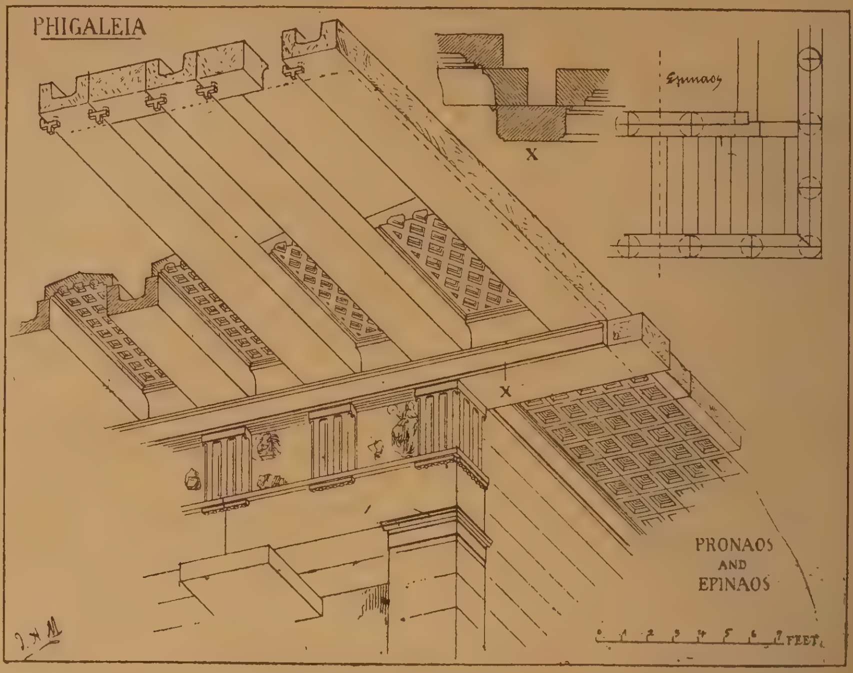
The lacunaria stones rest in rebates, cut along the top of the beams, and the projecting moulding on each side of the beam is relieved of the weight by a slight scamillus.

Plain, square coffers are cut completely through the ceiling stones, and separate covers, 10in. square, are fitted in rebates around the top of each coffer.

The jointing of these slabs, on the soffit, is concealed by a flush bead, which no doubt had its origin in the requirements of wood framing. A lacunaria stone is in the Museum, but its position there has evidently not been selected with a view to the convenience of the inquisitive student. Two cover stones for the coffers are also in the same room.

Temple of Nemesis, Rhamnus.—A smaller structure than the Theseum, and probably of later date, but the general arrangement of the





ceilings is the same. The frieze in front of the pronaos and epinaos was quite plain, but the architrave is of the usual Doric type, with tænia, regulæ, and guttæ. At the epinaos the return face of the antæ is exactly the width of the beam over, which spans the ambulatory, and it only required the introduction of an angle triglyph in the frieze to complete the connection.

The ceiling beams are 1ft. 2in. wide, 9in. deep, and 1ft. 11in. apart; the bearing for the front portico is 9ft. 9in. The lacunaria stones, which are 4in. thick, are cut through for the coffers, leaving the bars of the trellis only 3½in. wide. The slightness of this framing made it impossible to cut a separate rebate around each coffer for the cover stones, so the whole surface is dished, leaving only the outer margin 4in. thick, while the intermediate bars are reduced in thickness to 2¼in.; a small projection, or fillet, was, however, left on the top of the bars to make them stronger, and the bottom edge of the cover stones was cut away all round to overlap the fillets.

The cover stones are 9in. square and 2½in. thick, with sunk panels, enriched with an egg and tongue moulding. These panels being on separate stones, it is evident that the carving could be done with ease.

To fill in the spaces between the ends of the beams on the walls and peristyle, a moulded facia 2in. thick is let into grooves cut in the sides of the beams, the mouldings at the angles being mitred in the usual way. The relation of the roof timbers to the ceilings was probably the same as at the Theseum.

Temple of Apollo, Phigaleia.—Due—if we may credit Pausanias—to the unfettered genius of Ictinus; but whether by Ictinus or not, it must, according to Furtwängler, be later than the Parthenon.

Here the ceilings of the pronaos and epinaos are treated alike. The architrave and frieze are stopped at the antae, and merely the wall plate, or band, above the frieze, is carried across the ambulatory. The frieze is furnished with triglyphs and sculptured metopae (see fragments in the Museum), and these have determined the positions of the ceiling beams, an arrangement that has left a wider space between the beams at each end of the porticoes. The beams are hollowed out on the top, the object being to reduce the weight, and thus increase the strength; and the mouldings, which in other Doric examples are worked along the sides of the beams, are here worked on the lacunaria stones. Another peculiarity is seen in the blocks which fill up the spaces between the ends of the beams; these are moulded independently, and butted against the beams; while to keep them in position they are clamped to the beams on the underside, and a dowel, in the middle of each clamp, is let into the wall plate. There are no beams across the ambulatory, and the ceiling stones here rest directly on the wall plate. They are thus on the same level as the beams of the end porticoes, a position which kept them well clear of the roof timbers; while on the flanks of the porticoes the ceiling stones would be kept clear by the beam placed in the usual way.

It would be interesting to know how the lacunaria stones were jointed, but on this point we have no information to offer.

The Parthenon.—For a Doric temple, the plan of the vestibules is abnormal, and resembles somewhat the later Ionic types of Asia Minor. At each end a secondary row of columns is introduced, and the ambulatory is kept nearly the same width all round the building. The space between the inner colonnade and the naos takes the place of the ordinary pronaos and epinaos.

In arranging the ceiling at each end, the usual method of letting it occupy the full width of the building is here reversed by running the ceiling of the flanks through from end to end, so that the ceilings of the porticoes are restricted to the width of the cella, and the proportions improved.

The wall plate on the top of the frieze is continued around the cella without interruption, but above this, on the flanks, is another moulded band, which is carried across the end porticoes as an ordinary ceiling beam. The intermediate beams are placed 6ft. 6in. apart, with one in the centre; they are 3ft. 3in. wide, and 2ft. deep; the bearing is 10ft. 6in.

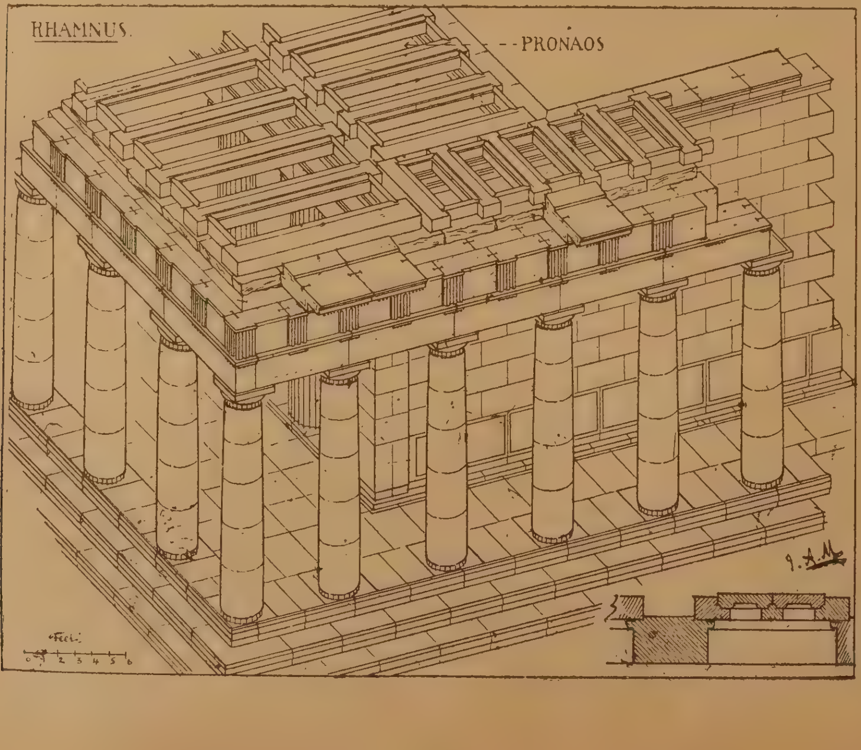
Like the temple at Phigaleia, there are no beams across the flanks, the lacunaria stones being dependent on the cella wall and the peristyle only; additional security was, however, obtained by rebating the stones on to each other at the joints. The lacunaria stones were deeply coffered, very much in the style of the later Ionic. It will be evident that the uniformity in the ceiling of the flanks would result in a corresponding uniformity in the treatment of the roof timbers—but the relation between the stone ceilings of peripteral temples, and the rafters of the roof will be more clearly seen when we come to consider the corona and roof tiling.

The Mausoleum.—Respecting the general arrangement of this ceiling, it is probable that it covered an ambulatory of a uniform clear width of about 7ft. all round the building. The compartments were square, and coincided with the intercolumniations of the peristyle. The architrave was in two thicknesses, laid flatwise, and the ceiling beams were brought into close relation to the columns by notching them into the lower section of the architrave.

The square compartments of the ceiling were gradually covered in by first framing around each opening four wide slabs, mitred at the angles; on these were placed smaller slabs, similarly jointed, and which still further reduced the opening; the central apertures were closed by square panels, which, it has been assumed, were identical with some sculptured panels discovered among the ruins by Sir C. T. Newton (see the restoration in the Museum). The carved mouldings of the ceiling beams and architraves are not, it will be observed, worked out of "the solid," but on separate stones, let into rebates; doubtless a matter of expediency, and suggestive of decadence.

The "Nereid" Monument.—For the ceiling of the ambulatory there are no separate beams, but projecting fillets, or ribs, are worked on one side of each lacunaria stone, and rebated on the top to receive the adjoining stone. The stones in the Museum were probably for the flanks; they are 3ft. long, and 1ft. 9in. wide, and were dowelled together at the sides; two coffers are sunk in each. A model in the Museum shows the general effect of the ceiling, but the arrangement at the angles of the peristyle is, we believe, conjectural.

Pseudo-Doric Temple, Samothrace.—The ceiling for the portico of this building of Hellen-



istic times was essentially Ionic in type. The architrave was jointed in the Doric fashion, but the ceiling beams which rested on it were placed over the columns only. These beams were nearly 20ft. in length and 7ft. 9in. from centre to centre, and to support the massive lacunaria stones (1ft. 6in. thick) they were gradually increased in depth towards the middle, somewhat in the manner of a bow girder.

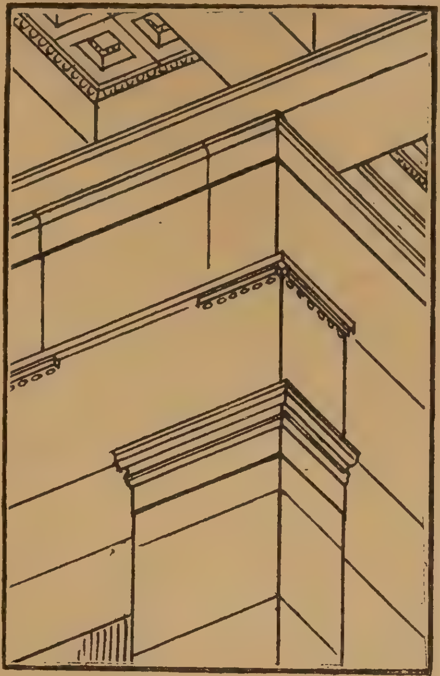
The stone ceilings over the pronaos and posticum of a Greek temple of the ordinary type call for no special comment, seeing that they were generally a counterpart of the ceilings over the end porticoes, already described.

(*To be continued.*)

OUR NEW JOURNAL.

Under the title "A Unique Trade Journal which has a career before it," "The Newsagent" says:—"We hinted a short while ago that in view of repeated representations from leading furniture manufacturers and designers that they and their allied trades were inadequately represented, the proprietors of the Builders' Journal and the Architectural Review had determined to publish a monthly trade journal under the title of the Furnisher. That decision has been put into practice, for the first number of the Furnisher lies before us. In style, appearance, and practicability, it is far and away the best publication of the kind in London or the provinces, and if it has the same amount of originality and studious care that are thrown into the papers already issued from Effingham House, Arundel Street, Strand, it has before it a prosperous future.

"The Furnisher appeals to all interested in furniture, decoration, upholstery, art metal work, stained glass, and electroplate, thus covering a very large field for circulation. Illustrations of a high class are scattered throughout its pages, the paper is of superior texture, and the printing of the best in vogue in London. The publishers are prepared to deal with newsagents on a generous scale. They offer to supply copies at the following rates: carriage paid, 13/12, 4s. 6d., on sale or return. So as to push the sale of their unique journal they have had a circular prospectus prepared, and these can be had simply for the asking for distribution to customers. The price is 6d. monthly. The trade would do well to take our advice and give this new journal, which has a strikingly original embossed cover, a fair trial. Personally, we wish the Furnisher *bon voyage*, and hope it has come to stay."

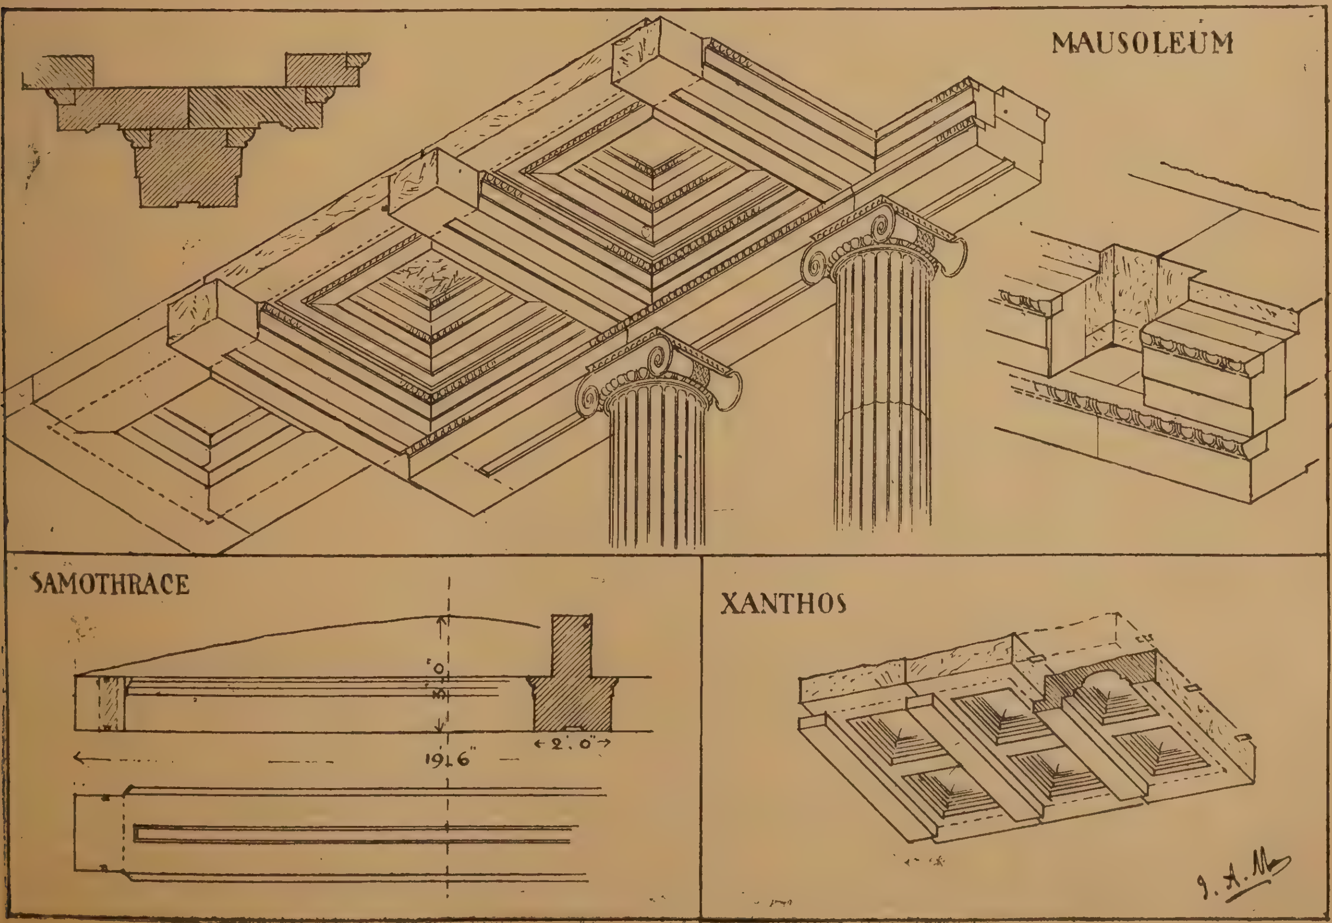


RHAMNUS. ANGLE OF EPINAOS.

ARCHITECTURAL ASSOCIATION.

ANNUAL GENERAL MEETING.

Last Friday evening, the 6th inst., at No. 9, Conduit Street, the Architectural Association opened its present session, when there was a good attendance. Mr. G. H. Fellowes Prynne, F.R.I.B.A., the president of the Association, was in the chair. The minutes of the last meeting were first read by Mr. G. B. Carvill, hon. secretary, and confirmed. The secretary then read a list of nominations. Mr. W. H. Seth-Smith then proposed the adoption of the report and balance-sheet of the year. He said it was always a pleasurable duty when the balance was on the right side as it was this year, and when it was better than last year. In every way they might feel that the Association was in a flourishing condition. Things had been placed upon a good basis, especially with the educational side, and this would assure that the financial condition of the Association would remain stable. There had been an increase in membership to the number of fifty-two. There were several reasons for this, one being that many of the old members had rejoined; there had, of course, been the usual resignations. Payments had been made stricter than they ever were, and this told against the increase of membership. Thanks were due for the very useful grant of £100 again made by the Royal Institute of British Architects. Mr. Seth-Smith, in dealing with other points in the report, expressed thanks for the papers and discussions given during the last session, and he expressed belief that there was no other society in London which provided more valuable papers than the Association did. Mr. Francis G. F. Hooper, in seconding the adoption of the report and balance-sheet, expressed regret that more than one of the prizes had not been awarded, but he thought that the remedy was in the hands of the members; the subjects had been as attractive as they had ever been, but the competition had been so small and the work done of not



sufficient merit to place it in the running with previous work. The report and balance sheet were carried unanimously. Mr. Hampden W. Pratt proposed a vote of thanks to the honorary auditors, who had done so much hard work—the vote was carried unanimously. The president announced that Mr. G. Collins and C. A. Kelley had been reinstated. He proposed Messrs. H. A. Satchell and A. H. Hart again as members of the committee, they having resigned in accordance with the rules as to officials. This was carried unanimously. He then proposed a vote of thanks to the Royal Institute of British Architects, for the grant they had made and for their great services to the Association, which the Association thoroughly appreciated. They, perhaps, had some right to expect these things, as they supplied the Institute with a vast number of students at every examination. The vote was carried by acclamation. Classes and lectures for the session were announced. The awards of the past sessions were then read and the prizes presented; the full list is as follows:—

PRIZE LIST.

The following is the prize list for session 1898-99:—A.A. Travelling Studentship, value £25, and bronze medal, D. T. Fyfe; second prize, value £5, H. Tanner, jun.; hon. mention, H. Farquharson; A.A. medal, not awarded; prize, value £5 5s., H. Tanner, jun.; Andrew Oliver prize, value £5 5s., G. J. T. Reavell; Arthur Cates Scholarship, C. L. Fleming-Williams. Lectures: Division I. —Silver medal and A.A. Scholarship, value £6 6s., P. J. Westwood; bronze medal, A. R. Conder; hon. mention, H. J. Worrow. Division II.—Silver medal, P. J. Turner; bronze medal, H. S. Barrett; hon. mention, R. H. Spalding. Studio: Division I.—Silver medal and one volume of the A.A. Sketch Book, S. V. North; bronze medal, A. A. Carder. Division II.—Silver medal, A. Symon; bronze medal and one volume of the A.A. Sketch Book, G. H. Jenkins; hon. mention, W. J. Davies.

The following is the order of merit:—

Division I. — Greek and Roman Orders— C. H. R. Henman, certificate; S. V. North; P. J. Westwood. Elementary Construction— P. J. Westwood, certificate and book; B. Greig; A. R. Conder. English Architecture—P. J. Westwood, certificate and book; A. R. Conder; G. L. Elkington. Mediæval and Renaissance— S. H. Goodwin, certificate and book; B. Greig; S. Bridges. Elementary Physics, Formulæ, and Calculations—H. J. Worrow, certificate and book; P. J. Westwood; B. Greig. Plane and Solid Geometry—W. A. Jeckells, certificate and book; A. R. Conder; H. J. Worrow.

Division II.—Materials, their Nature and Application—T. G. Chambers, certificate and book; H. S. Barrett; P. J. Turner. Construction—P. J. Turner, certificate and book; R. H. Spalding; A. S. Dorrell. Drainage and Water Supply — P. J. Turner, certificate; P. B. Dannatt; J. E. Franck. Ventilation, Lighting, and Heating—J. E. Franck, certificate; S. H. Goodwin; P. J. Turner. Professional Practice—P. J. Turner, certificate; S. H. Goodwin; J. E. Franck. Elementary Class of Design—First prize, value £1 1s., with silver medal and certificate, R. Knott; second prize, bronze medal and certificate, E. S. Collins; hon. mention, E. Brantwood-Muff. Advanced Class of Design—First prize, value £1 1s., with silver medal and certificate, J. A. Swan.

PRESIDENT'S ADDRESS.

The president then delivered his inaugural address as follows:—Gentlemen, and Fellow-Students in Architecture: My first words in addressing you for the second time from this chair, must be to express my warm appreciation of the honour you have done me in re-electing me as your president for the ensuing year. If when I first accepted this honourable and important position, I felt that the responsibility was a great one, I can assure you that, after a year in office, my sense of that responsibility has increased rather than diminished, and it is with no small diffidence that I again accept the post of president of the Architectural Association. However, the very fact of my re-election leads me to hope that I still have your confidence, and that I may depend upon your help and support during the coming session. I can only promise you I will give in the future, as I indeed have tried to do in the past, my best services and energies to the interests of the Architectural Association, and its grand educational work. Before proceeding with the more formal part of this address, I cannot refrain from first expressing my warmest gratitude to each individual member of the late committee for their unswerving loyalty and support given to me as their chairman during the last session, and especially to the hon. secretaries, Mr. Howley Sim and Mr. G. B. Carvill, and our secretary, Mr. Driver. Nothing could have exceeded the harmony and good will that has existed on all sides. There has, as far as I remember, been

No Single Note of Discord.

All have worked with one end and aim—the good of the A.A.—with the natural result that I think we may fairly congratulate ourselves upon the exceptional — I may say, almost phenomenal—success, both from a working and financial point of view, of the past session. First, as regards membership, I am glad to be able to state that the roll of members is the highest on record, and that the total now exceeds 1,250. That our financial position is equally sound and satisfactory may be judged from the fact that, in spite of necessarily increased expenditure, we are able to carry forward a record balance of not less than £224 odd to our premises and general fund. In my opening address last year it may be remembered that I called special attention to the work of the studio, and more particularly to that branch of its work that most closely binds us with the past work of the Association, and is still most closely allied to the voluntary system of teaching—I mean

The School of Design.

I then pointed out that the committee had been a good deal puzzled to find out the cause for the general falling off in the membership and work of this once popular class, and I expressed my earnest hope that the alterations made as to the fees, and the working out of designs would make the work of that class more really representative of the work of the Architectural Association. My hopes have been more than verified, and it is most satisfactory to find that the efforts of the committee have in a great measure succeeded in making both the elementary and advanced classes of design as they should be, not only the most popular, but one of the most useful classes in the whole system of the work of the Association. As against the numbers of twenty-two and twelve students who joined the elementary and advanced classes of design respectively in the previous session, no less than seventy-eight and seventeen students joined during the last session. This success was, I am glad to say, not confined to numbers only; the work done showed a great advance on that of some previous years, and some designs sent in were of considerable merit.

The Interest and Enthusiasm

was, however, partly perhaps owing to numbers, better sustained in the elementary than in the advanced class. It is hoped that this may be remedied in future years, as the committee, profiting by the experience gained during the last session, have wisely decided to make the subjects in the elementary class somewhat more elementary in character, with the view of inducing all students who join the elementary class in their early years of study, as a matter of course to follow on into the advanced class, which in future will not be an advanced class in name only. I do most sincerely hope that all students who joined the elementary class last session will rejoin the School of Design this year, and continue their studies, either by going on into the advanced class, or remaining for another session in the elementary class of design, as I cannot too strongly urge upon students that it is not by one or two flashy, or perhaps even clever designs, made in a single session, by which their work will best be judged, or that will be of most value to them, but by carefully giving their attention to the smallest details in design, and methodically following on their work stage by stage for two or three sessions. "Do little things now," says

A Persian Proverb,

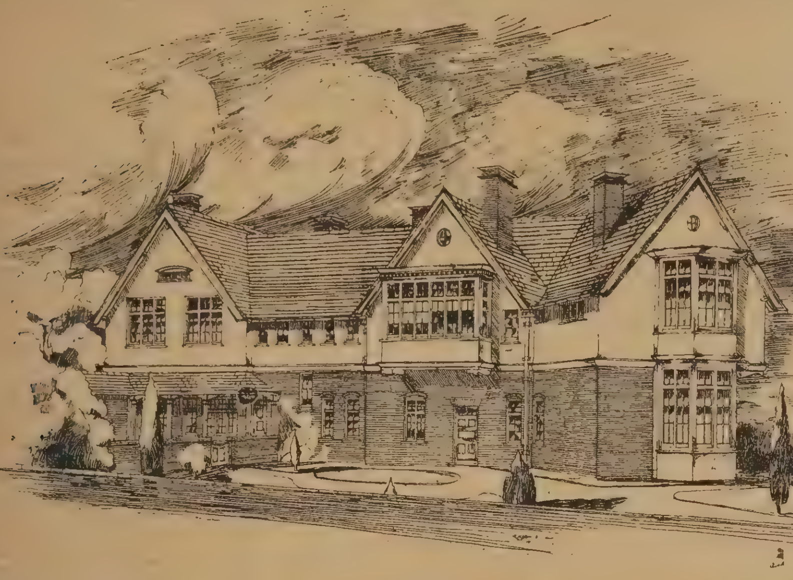
"so shall big things come to thee, asking to be done." It is no small thing for students to be able to get the advantage of criticism upon their early work freely and ungrudgingly given by many of the well-known artists whose names appear on our visitors' list, and I cannot too strongly advise them to get as much out of those visitors as they possibly can while they have the chance. I think those who were present at the first meeting of the studio on October 11th last year will have appreciated the innovation of opening the session with short informal addresses to students, when Mr. Aston Webb and Mr. Cole Adams so kindly gave us their valuable support. It is not too much to say I think that this meeting inspired very genuine enthusiasm amongst the students, old and young, and that Mr. Aston Webb's useful hints on planning, and warm and sympathetic remarks in reference to the class of design, will long be remembered by all who heard them. While mentioning Mr. Aston Webb's name, I cannot refrain from referring to the well-deserved honour bestowed upon him by the Royal Academy. No election made by that body has ever been more popular in the ranks of the A.A. than that of our past president and warm supporter, Mr. Aston Webb, and no congratulations offered to him are more sincere and hearty than those offered by the members of our body. I hope that

The Work of the Present Session

will be opened in a similar manner, and I am glad to be able to state that Mr. Ricardo and Mr. Seth-Smith have kindly consented to give us their help on Tuesday next, October 10th, by short, practical, descriptive addresses. While referring to the studio work, which has been so thoroughly and ably carried forward by Mr. W. G. B. Lewis, assisted by Mr. De Gruchy, I must commend to the notice of students the admirable system of time sketches started during the last session by Mr. Lewis. These sketch designs, made under the direct supervision of the instructor, will be found most valuable, especially to younger students. The system will help in giving them method in their earliest attempts at design, and so render their future efforts in design more direct and effective. Encouraging as the students' work in the studio has been, there is room for improvement. The danger of working with no higher aim than to make drawings sufficiently good for qualification in the R.I.B.A. examinations or for admission to the R.A. is a real one; and the falling off in the attendance towards the end of the session shows a lack of appreciation on the part of some students of the greatness of the work that lies before them, and of the necessity of thoroughness and methodical perseverance in their studies. Another branch of

The Studio Work

that is not receiving the support of students in a manner which the importance of the subject demands, is the modelling class. This is all the more extraordinary, as we still retain the valuable services of our old friend, Mr. F. W. Pomeroy as instructor, who, as I said when addressing you last year, is second to none in his art. I will not again repeat the sentiments I previously expressed as to the immense value of modelling to the architect. It needs no further argument on my part to justify its value in the eyes of all true artists in our ranks. But the committee have, as usual, gone to the root of the matter, and recognising that the argument of £ s. d. is found to be the most clinching of any, have decided to reduce the fees for the modelling class for students attending the studio to less than one-half the original fee, while any other member of the Association can now obtain the best instruction in modelling at the nominal fee of 12s. 6d. Surely a valuable class such as this will not languish in future for members. With regard to the lectures, I am glad to say that the average attendance has been well



DESIGN FOR A COUNTRY HOUSE BY RUPERT C. AUSTIN ("TRY.")

maintained, and that we are fortunate in retaining the valuable services of our many able instructors. In concluding my remarks upon the practical part of the work of the last session, I perhaps ought to mention the fact that

The Land Surveying and Levelling Class

was not held, owing to the small number of entries. But considering the multifarious subjects the architectural student has to face nowadays, one is not surprised that this practical subject of land surveying should, in some sessions, not receive the support it deserves. It must, however, be evident that to a large number of architects a knowledge of the subject is most useful, if not essential. An excellent new level has been purchased for the use of future members of this class. With regard to other useful branches of work, I should like to call attention to that of the Camera Club. It was decided last session to commence a really useful collection of lantern slides of architectural subjects, which would not only be useful to lecturers, but also to readers of papers in illustrating their subjects. Now, any members of the A.A. who are amateur photographers can help us greatly, by either sending to the secretary of

The Camera Club

any good negatives they may have of ancient buildings or of architectural detail; or still better, by sending lantern slides already made. We are anxious that the collection shall be very comprehensive in character, and at the same time good in quality. All negatives or slides sent will go before a sub-committee for careful selection. The great value of such a collection will at once be apparent to any who have had experience in the difficulty of obtaining suitable slides to illustrate papers on art generally and architecture in particular. It will be noticed in the Brown Book that certain alterations have been made with regard to prizes. Medals will not be quite so common as before, and will consequently, perhaps, be more valued, and a larger number of book prizes will be offered. I must call attention to the fact that for some years there has been no competition for the prize of £10 10s., kindly offered by the Architectural Union Company, for the best set of measured drawings. This prize used to be competed for regularly, and the reason for its being neglected now is quite incomprehensible to myself and others. The Architectural Union Company do not offer this valuable prize just for the fun of the thing, we may be sure, and we cannot, therefore, be surprised if the offer of a prize is withdrawn should no competitors be found during the coming session. I do hope I have only thus to bring the matter to the notice of students to secure a good competition in future.

(To be continued.)

BUILDERS' JOURNAL COMPETITION.

DESIGN BY "TRY."

THE following is the description which accompanied the designs submitted in connection with our recent competition by Mr. Rupert C. Austin ("Try"), and which are illustrated in our centre plates:—

The chief difficulties met with in arranging the required accommodation were as follows: Restricted limit of frontage; larger accommodation required on first floor than on ground floor; and the necessity for all best rooms to face north on account of the view.

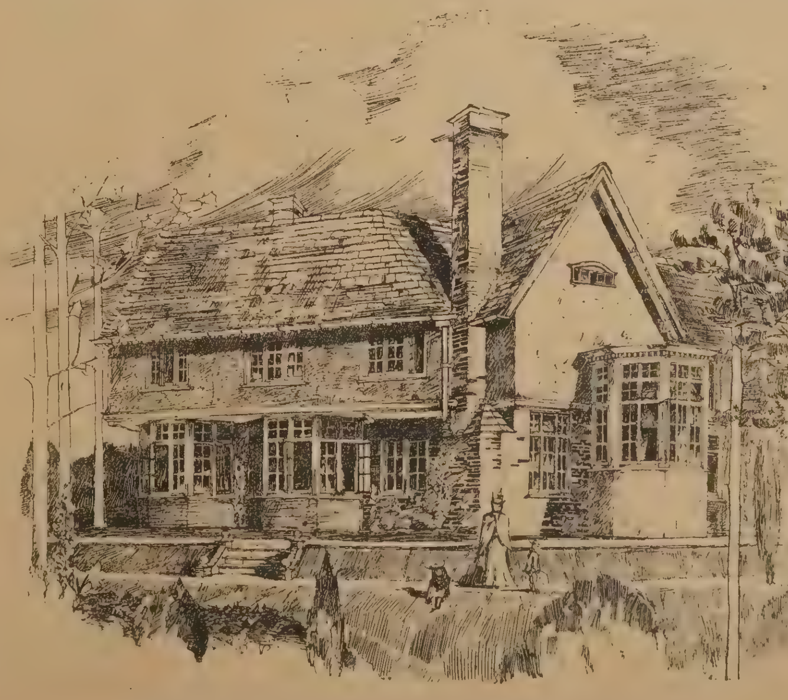
These difficulties were met as far as possible in the following way: The limited frontage was overcome by skewing the boudoir and study wing at an angle of forty-five degrees to the main front, thus avoiding the hillock and sudden drop at the south-east corner of the site; at the same time an excellent view is secured from the study and boudoir, and also a sunny aspect for the latter room. Larger accommodation required on first floor than on ground floor. The necessity for providing nine bedrooms on the first floor without having recourse to attics has proved to be a difficult task, especially as the required gallery running round the hall necessitates an open roof, hence loss of available space; it was found necessary to somewhat sacrifice the dimensions of some of the rooms in order to obtain the requisite number, but it is very desirable that one room at least should be dispensed with entirely, if not two. The necessity for best rooms to face north materially influences the plan, as it is most desirable that the best rooms should command the view. The bedrooms over the boudoir wing are carried out over the bay windows on the ground floor in order to provide a requisite amount of floor space.

General Description.

The front door faces as nearly south as possible, and leads into a vestibule, with lavatory and w.c. on the left and boudoir on the right. The vestibule opens directly into the hall, which is treated as a billiard-room, and also forms the general sitting-room for the house; a cosy corner at the right hand side on entering commands the view, and is also intended to be used for a raised lounge or dais while the billiard table is in use. The staircase is carried up in the large bay window opposite the door from the vestibule; a gallery landing is formed 8ft. 6in. above the ground floor level; from this a flight of five steps leads to the main gallery, which gives access at both ends to the corridors leading to the bedrooms. Off the main hall is situated on the right the study, and on the left the dining-room, with doors of communication opening off the hall; the dining-room also communicates with the corridor which leads to the servants' quarters. From this corridor access is obtained to the pantry opposite the dining-room, the back staircase, boots, storeroom, larder, scullery, kitchen, and servants' hall, and also a direct way to the covered verandah leading to the yard, w.c., and fuel place. The kitchen wing is entirely shut off from the house by means of a door from the hall and also by swing doors in the corridor.

First Floor.

The main staircase from the hall leads to the gallery; the ceiling of the hall is carried up open through the two storeys. The walls are plastered, except where panelling occurs. The roof is ceiled at the top side of the collar beam, and plastered to the upper side of the rafters, all visible timber—namely, trusses, common rafters, panelling, doors, mantel, staircases, &c.—to be of painted deal. Over



DESIGN FOR A COUNTRY HOUSE BY RUPERT C. AUSTIN ("TRY.")

the boudoir wing the two largest bedrooms are situated, one of which has a bathroom and the other a dressing-room in direct communication; the second bathroom and linen-room are also in this wing. Off the gallery opens one bedroom. The main corridor gives access to two fair-sized bedrooms; off a lobby is the w.c., housemaid's sink, and broom cupboard. Close to the back staircase is a door in the corridor which entirely cuts off the servants' wing from the rest of the house; in this wing are two good bedrooms and one small room, forming a total of nine bedrooms in all and one dressing-room.

Outside.

The ground floor and chimneys are to be built of red facing bricks, walls plastered inside, the first floor outer walls to be timber and brick nogging, the outer face to be covered with rough cast, inside walls to be plastered same as ground floor. The roof is to be covered with red tiles. All bay windows to be timber and brick nogging, covered with rough cast where shown on the drawings. Wood block flooring to be used in the hall, tiles in the vestibule, w.c., &c., boarded floors in the dining-room, study, boudoir, bedrooms, kitchen, and servants' hall, boots and store-room, cement floors in scullery and offices.

Correspondence.

"THE FINEST TRADE JOURNAL."

To the Editor of The Builders' Journal.

Burnham.

Dear Sir,—I have purchased your journal from its commencement, and noted with great pleasure and profit its gradual development to what it now is, "the finest trade journal in the kingdom." It is a great boon to country builders of limited means who are remote from centres of civilisation, it brings us into touch with larger men and ideas, and gives us courage to go on in our endeavours to give our customers honest work, notwithstanding that we sometimes have to compete with unscrupulous men in our own line.

I hope your new venture (which I have ordered) will be as successful as your former ones, and that it will deal liberally with the higher branches of the trades, especially joiners' work, which is, in the country at all events, almost an extinct art.—With all good wishes, yours truly, W. J. P.

[We are obliged to our correspondent for his encouraging expressions of appreciation. The first number of our new journal, The Furnisher, is now ready, and judging from the comments that have already reached us it is likely to be as widely appreciated as the Builders' Journal and Architectural Record.—Ed.]

DESIGN FOR A CHURCH AT SOUTHEND.

To the Editor of The Builders' Journal.

10, Basinghall Street, E.C.

Dear Sir,—My attention has been called to a perspective view in your paper of June 21st, 1899, called "Design for Presbyterian Church, Southend." I confess I was somewhat surprised to see it, for the Presbyterian Church at Southend had been built under me, and was opened complete more than a year before the above-mentioned "design" appeared. My surprise was increased by the fact that I had never heard of the name of the designer or of any other architect in connection with this church, for which I prepared the plans and superintended the execution.—Yours faithfully, THOMAS ARNOLD.

[We publish Mr. Arnold's letter in order to avoid any possible misapprehension as to the authorship of the design which was actually carried out. The author of the design which we published—Mr. John C. T. Murray—thus explains the circumstances of its origin:—"At the time the building of this church was being promoted I was asked by the gentleman principally interested in the scheme to submit a sketch plan and design, and I understood at the time one or two other designs were under his consideration. I believe Mr. Arnold's was decided upon."—Ed.]

WORKMEN'S DWELLINGS AT CLAYGATE.

THE ETIQUETTE OF CRITICISM.

To the Editor of The Builders' Journal.

London, W.

Dear Sir,—In your issue of last Wednesday's date there was a somewhat voluminous correspondence, criticising a small drawing of proposed workmen's dwellings at Claygate.

May I be allowed to touch upon one point in these criticisms? One gentleman accompanied his criticism with a plan, showing what he thought was a more reasonable scheme, which point I will not enter upon.

This system of criticism, however, appears to be a growing habit, as, but a little while ago, a plan in one of the professional journals was similarly criticised, and it appears to me to be a matter of most questionable taste.

The professional journals now lie in nearly all public libraries, and it is very possible the client may see these criticisms and be prejudiced against his professional adviser thereby. Taking such to be the case, I am sure the author of the criticism could only come to the one conclusion—that he had been guilty of most unkind and unprofessional conduct.

Lastly, in those criticisms one has, as a rule, so little guarantee that the author of the criticism is capable. Mr. Brett may be an expert in this subject, but his conclusion that a speculative client would be likely in a row of houses to extend his frontage for each block 10ft. 6in. and his depth 5ft. 6in., leads one to believe that he has had but little dealing with such clients, or only with those who possess most elastic sites. M. C.

IS OUR PRESENT SYSTEM OF EXAMINATIONS A FAILURE?

To the Editor of The Builders' Journal.

Staines.

Dear Sir,—The discussion in the above subject, inaugurated by "K." in your issue for Sept. 20th, is a really important one, seeing that entry into many of the better paid and "permanent" positions is through the door of a competitive examination. As is well known, the tendency is towards making these examinations stiffer and stiffer, and the cause of this stiffening is, primarily, the enormous and altogether disproportionate number of candidates for the comparatively few vacant posts thrown open to competition.

Theoretically, the examination system should be fairness itself, and should result in the best man winning the coveted post; but here, as in many other instances, practice knocks theory into the proverbial "cocked hat." Were all examinations conducted strictly in those subjects which the candidate would find useful in after life, or which would fit him the better to hold the position for which he is competing, little objection could be raised to the system notwithstanding the fact that, owing to nervousness or some other cause, the best man may not always win first place, or even may win no place at all; but when, as is the actual fact, the candidate has to submit to examination in subjects which are as remote from his future duties as the Greek Kalends, it cannot but be admitted that the present examination system is, in a large measure, a farce. It usually resolves itself into the case that the candidate who possesses the greatest amount of superficial cleverness, combined with a good memory and a capacity for "cramming," outreaches the solid, painstaking student, who, in a general sense, may be, and frequently is, the more worthy man of the two.

So much for competitive examinations in general. Coming now to the question of purely technical examinations, we find the state of affairs, if anything, a shade worse. It is a fact beyond dispute that some of the examiners in the building-trade subjects are men, who if set to answer the questions propounded by them would fail, and fail miserably, to satisfy any thoroughly practical examiner of their fitness to be considered as capable instructors in those arts or crafts of which they are supposed to be shining lights, and in the practical exposition of which they might be expected to be reasonably efficient. This is a strong assertion, but it is perfectly true; and if asked why these things should be, I can only reply that the man of superficial cleverness, who is able and usually not averse to blowing his own trumpet with considerable gusto, fancies himself, and, to some extent, persuades others to fancy him as one of the leading exponents of his particular art or craft.

In technical subjects naturally, the student has to rely largely upon text-books, and taking text-books and craft manuals as a whole one is bound to admit that for the most part they contain but one small halfpennyworth of bread to an intolerable deal of sack! The man that is thoroughly practical in his craft or profession, and combines therewith a considerable amount of literary ability, is a *rara avis*, consequently a text-books is frequently either so mistly worded as to convey no true impression of the author's meaning, or it is mainly a compilation of other and older text-books which are out-of-date and otherwise technically defective. Examiners in technical subjects are, not unnaturally, largely drawn from the class of men who have achieved some notoriety from the publication of an exhaustive (?) text-books, and it follows as a matter of course that the answers of candidates must be based upon text-books if the coveted certificate is to be won; and it is by reason of these very facts that certificates are not more largely prized in the workshop, where their holder is more often than not treated as an object of derision or looked down upon as merely a theoretical chap who considers himself a notch above his mates.

That the present system of examination is more or less of a failure is an undoubted fact. Only in a small measure does it accomplish its aim and end, for in no way do examinations as at present conducted tend towards the survival of the fittest among the examined. If the range of study were confined to fewer channels and the subjects of examination brought down to the basis of practical every-day utility, the plodding, painstaking, practical man might have a chance. Technical education and examinations in general are conducted too much on the present-day School Board style, by which the pupil often gets "a smattering of everything and a sufficiency of nothing." This should be seen to before its evil effects become more pronounced.

TECHNIQUE.

Military Memorial for Canterbury Cathedral.—A monument is to be erected in the nave of Canterbury Cathedral in memory of officers, non-commissioned officers, and privates of the 1st Battalion of the Buffs (East Kent Regiment) who were killed in action or died of wounds or disease in the Chitral and Punjab frontier campaign from 1895 to 1898. The monument is being erected by the comrades of the deceased.

The Hotel de l'Europe, in Leicester Square, was opened recently. Mr. T. Walter L. Emden, the architect, has introduced a continental feature, namely, the Brasserie, which is in German Renaissance style. A fine effect is obtained at night by the electric lamps, which represent fruit half hidden in the festoons of leaves and flowers, in repoussé, hanging from the beams and columns. In the base is a lager-beer hall, and on the first floor is an Italian Renaissance room, to be used as an à la carte restaurant, which is adjoined by a reception chamber, in Louis XVI. style.

BRITISH PLASTERWORK, PAST AND FUTURE.*

By GEO. P. BANKART.

PLASTERWORK is an art (or was so) as well as a craft, and that quality which raises it *into* an art is the very one that escapes our analysis. Art came and grew with man's intellect, craftsmanship with his knowledge of things. In the past art and craftsmanship were united, and worked in the common cause. At present craftsmanship has strangled art, and become utilitarian only, in the vulgar sense of the word, but is combined with science. It would be well could all three join hands again—as they must do eventually—for they have a wide field in front of them, and Art should in its proper function take the lead, not so much by being talked about as by being practised. We require more workers and less talkers if anythink is to come of it. We want fact more than theory. We must hold it as a duty of industry to examine the past and the present, and also to think of those who are to come after us, as we may hope that they may look back on us.

In this paper I will give a few plain facts concerning the past history of plasterwork, and also state a few facts concerning the future, which facts cannot be evaded if we are again to have a national art of plastering of any worth. I must therefore be concise and deal chiefly with the work which forms so interesting a feature in the decoration of British houses of the sixteenth and seventeenth centuries.

This work forms itself readily into two chief divisions; the one, "stucco-duro," the chief basis of which is carbonate of lime; the other, plaster of Paris or sulphate of lime. We have it on the best authority that the former, the art of working in

Stucco

or "stucco-duro," was much practised by the ancients; but it is still uncertain whether it was practised by the Greeks. Judging from the Greek character of the early Roman work, one may be strongly inclined to think that they did employ it. To the fifteenth century, however, we must refer to see how our own country was more directly influenced by its rivival. During the long interval which elapsed between the downfall of the Roman Empire and the Renaissance of art, stucco working became almost a lost art; yet not entirely so, for it worked Eastward like the Roman power influencing the art of Arabia and India.

Morto-da-Feltro, so named because of his morbid nature and subterranean investigations for ancient examples, rediscovered this material in the latter part of the fifteenth century, and the revival of the art of working it followed the Renaissance of art at a little later period through the partial exhumation of the Baths of Titus by the orders of Cardinal Giovanni di Medici. The Renaissance was matured on the search for specimens of the antique arts, so also was the revival of Stucco working. Raphael and his assistant, Giovanni-da-Udine, were particularly interested and impressed by these discoveries and the extreme delicacy and beauty of the modelling on the Walls. Giovanni immediately set to work experimenting in the reproduction of the method, the result being practically the same as the composition described by Vitruvius, *i.e.*, lime of the best quality, tempered for a long time before being used, chopped from time to time with a heavy hatchet, and well beaten with heavy sticks. It was usually laid on in three coats, or as many coats as the nature of the work required. The first coat was of rough stuff containing broken marble, forming the wall covering. The second coat was of finer stuff, forming the background, upon which the design was worked. The third and the finishing coat was a mixture of lime and very fine marble dust for the modelling, which, when dry, was polished with marble dust and chalk.

This modelling coat was toughened and regulated in its setting qualities, so that it might be worked upon for some days together by such ingredients as rye-dough, juice of figs, curdled milk, hog's lard, and blood. With such a composition, modelling of unrivalled excellence and beauty was executed with readiness and ease, the aim being to attain the hardness and whiteness of the stucco used by the ancients.

Giovanni's success was great, and Raphael handed over to him the decoration of the Loggie of the Vatican, followed by the Villa Maddonna, and Raphael's own house, which was treated externally as well as internally. This was enough to establish

The new Art

which spread with great rapidity in the capitol until the fall of Rome, whence it was carried to Venice by Sansovino, who, with the assistance of the designer, Alessandro Vittorio, executed much fine work, the Scala d'oro, in the Ducal Palace, being, perhaps, one of the best known examples. In 1524 it reached Mantua, where a most important school was founded. Here Primaticcio, a young artist of great inventive power, worked in stucco with such success that his fame reached François I. of France, who employed him at Fontainebleau. This is an important point in our history, for having thus found its way into France, Henry VIII. of England, the great rival of François in all things, would not rest until he had imported the art into England. He invited numbers of Italian artists, architects, and sculptors into this country to the death of our traditions, our trade guilds, and our architecture, which was at that time the resultant of the crafts in combination, in association. The national folk lore architecture was crushed out, the traditions lost, and the imitation of the Roman fashion of building, like Roman law, became universal throughout Europe.

Henry VIII. set his Italian craftsmen to work on the erection of the wonderful palace of "Nonesuch," but, unfortunately, no trace of this building remains to us at the present day, and we have only vague descriptions of its appearance. It is said to have been commenced about 1527, and to have had "a double quadrangular plan, with lofty pavilions at the angles, and elaborate porches, salient bays on its sides, a great clock tower, and was guarded by a gatehouse." It was built, according to the custom of country houses at that period, of framed timber work, and was thus especially adapted for the display of the new art. This idea was immediately seized upon by the Italians, the principal of whom appears to have been one named Toto-del-Nemziata. Thus each panel of the timber framing of this great palace became filled with a coloured stucco figure.

The introduction of this great art into England is assigned to Toto-del-Nemziata and his fellow workers, who were the "advance guard" of a continuous stream of Italian craftsman, who carried on the work in this country until the commencement of the eighteenth century. These men trained up a school of English craftsmen, who rapidly propagated the knowledge and practice of the new art throughout the country.

During the Parliamentary wars the palace of "Nonesuch" was stripped of its lead and otherwise despoiled. Pepys, who saw it in 1665, says: "all the house on the outside was filled with figures of stories and good paintings." This new fashion set by the king at "Nonesuch," prevailed during the latter part of the sixteenth century, and throughout the seventeenth century few houses or mansions were erected in England that did not employ the art of the stucco worker, internally and externally.

In 1547 Charles Williams is mentioned as an English stucco-worker of renown. He had travelled in Italy, and may probably have done work at "Nonesuch" palace. About this time he offered his services to Sir John Thynn in supplying internal decorations "after the Italian fashion" at Longleat House, which Sir John had then just commenced building.

"Bess of Hardwick" and Sir William Cavendish were also building the old Hall at Hardwick, in Derbyshire (now in ruins), and wrote to Sir John Thynn requesting the use of this "cunning playsterer," who they were told had made "dyvers pendants and other pretty things, and had flowered the Hall at Longleat." The frieze, part of which is now to be seen on the ruined walls of the "Giants' Chamber" in the old hall at Hardwick, is most probably the work of this Charles Williams. In the New Hall, which was built between the years 1590 and 1597, is a freize 11ft. deep, representing a forest with human figures, plants, and animals, all modelled with metal tools, the distant hills being painted on the background. This frieze is probably the work of a school of craftsmen established by Charles Williams, and the modelling is perhaps less masterly in execution than the former, though a very wonderful piece of work all the same. When the New Hall was erected the old one was dismantled and the famous frieze considerably damaged, and it is wonderful that what is still left is as fresh and perfect as when just finished, the tool marks being distinctly visible on its surface in spite of exposure to atmospheric changes of all kinds for so long a period.

These two pieces of work are probably the best examples in this country showing the possibilities of the Italian "stucco-duro" material that we have the good fortune to inherit, and they should be carefully studied by all students of this art.

The Italian character did not exist long in the hands of English craftsmen. The materials were expensive and difficult to procure, and "stucco-duro" soon gave way to the modelling and stamping of the coarser plaster or "pargetry" that had always been used for their ordinary work. The word "pargetry" or "pargetting," now used by bricklayers for the coarse plastering of chimney flues, was originally plaster work of the period decorated by means of stamps or impressed patterns in the soft material, whether external or internal. Sometimes a combination of pressed work and hand modelling was done with very good results, and this is sometimes called "parget work."

The English plaster worker did not attempt to vie with the more artistically-educated Italian, but struck out for himself, forming a decoration of his own in no way based on the Italian method. In this decoration his chief characteristic is in the arrangement of formative panelling, rather than in figure modelling. Taking the perpendicular fan tracery as a basis, he founded and developed an arrangement of ribs and pendentives geometrically set with great intricacy. The Englishmen were not, like the Italians, trained in the disposition and modelling of the human figure, and more often than not the lowness of the rooms in our English homes required less ambitious treatment than the vast halls of the more sunny southern countries. These early attempts of the newly-founded English School were mostly confined to patterns of small area which would repeat with ease.

(To be continued.)

New Club Premises for Hull.—Mr. B. S. Jacobs, architect, of Lincoln's Inn Buildings, Bowlalley Lane, Hull, has accepted, on behalf of the "Pacific Club," Limited, the tender of Mr. W. Sanderson, builder, Temple Street, Beverley Road, Hull, at a sum of between £5,000 and £6,000, for the building of a new club, restaurant, &c., in the High Street, Hull. This club was formed by a few of the principal corn merchants a few years ago, and it has so increased its membership and out-grown the accommodation that they decided to build new premises. The ground plan is designed as an exchange, with a large centre room having side adjuncts. A row of arches on each side support, the upper rooms forming the restaurant. Skylights on each side light the ground floor.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"The grandest productions of architecture are not so much individual as social works, rather the offspring of nations in labour than the inventions of genius; the deposit left by a people; the accumulations formed by ages; the residuum of the successive evaporations of human society—in short, a species of formations. Every wave of time superinduces its alluvion, every generation deposits its stratum upon the structure, every individual brings his stone. Such is the process of the beavers, such that of the bees, such that of men. The great emblem of architecture, Babel, is a bee-hive."—VICTOR HUGO.

A Great Canal. A REPORT has recently been circulated that the Russian Government intend to build a canal from the Black Sea to the Baltic for strategic purposes. A cursory glance at the map will show that this is indeed a huge scheme. Though it is denied that such a proposal is on foot, it is admitted that influential men have endorsed it, and the denial does not extend beyond the time necessary to complete the network of European and Asiatic railways which Russia is pushing forward with all speed. In short, this new scheme cannot really be practically adopted until the Russian railways begin to pay. Russia intends to strike wherever and whenever she can at the British carrying trade, and this canal (were it ever completed) would no doubt create grave complications is more ways than one. One writer says that Russia's initial blows may seem light and almost unsuspicious, but she is merely reserving her shattering force till she is socially, politically, and financially strong enough to wield it. The canal is estimated to cost at the very least 150,000,000 of roubles.

Statues on Mountains. ITALY has lately developed a peculiar taste for placing statues on mountain peaks, where only the hardy ones are ever likely to see them. If a scheme which is now being entertained of commemorating the "Holy Year" is carried out, Italy's mountains will be well decorated. It is the intention of a special committee just formed to erect nineteen statues of Christ, one for each century since the birth of the Christain era, on high mountain peaks in different parts of the Peninsula. The statues will all be of colossal size in gilded iron, and will be illuminated at night. The marble pedestals will bear inscriptions stating the purpose of the statues. It is proposed to have three overlooking the frontier of France, three overlooking Switzerland, and three on the Austrian frontier; one above the village of Porretta in the Apennines between Bologna and Florence; one on Mount Soratte, the highest peak near Rome, celebrated through the description of a sunrise seen from there by Horace; another on the Gran Sasso d' Italia (Great Stone of Italy), in the centre of the Abruzzi, whence can be seen the three seas surrounding the Peninsula; and another on Mount Altino, near Gaeta, dominating the magnificent Gulfs, of Gaeta, Naples and Salerno. Three will be raised in the extreme south, one among the hills of Calabria in the "toe," another in the "heel," and the third in the "instep" of the "boot," two in Sicily, and one in Sardinia.

Giants' Graves. IN the neighbourhood of Portadown, on the lands of Major Boyd Bredon, at Ballinteggart, what have been popularly known as the "giants' graves" have been excavated, measured, sketched, and photographed. This is not the first time the graves have been investigated, as at least twice during the last two centuries have they been opened. It was not expected that much of interest would be found. The graves are surrounded by an oval fence of stone and earth, and consist of four connected chambers, measuring together about 34ft. lengthwise. In one of these chambers was found a rude tiling of flat stones and a deposit of charcoal, which seems to point to incineration rather than interment as the mode of sepulture.

The Royal Sepulchre. THE royal sepulchre beneath St. George's Chapel and the Albert Memorial at Windsor is being considerably improved. It was constructed by George III. The vaulted roof is supported by massive octagonal columns, which support the ranges of stone shelves upon which the coffins are placed; there are also stone tables, a foot high, for the same purpose, at the east end and in the centre. In order to obtain an entrance to the mausoleum it has, until now, been necessary to remove heavy iron plates, which guard and seal the stone stairway to the vault. At the entrance to the vault, which is at the east end of St. George's Chapel, an arched doorway is to be put up, and electric lights have been installed. Several of the coffins are being shifted, and a fine marble altar is to be erected at the east end of the vault. These alterations are being carried out under the personal supervision of Mr. A. Y. Nutt, of the Office of Works; Messrs. Wheeler, of Reading, being the contractor.

A Word About Technical Education. SOME good advice was given with regard to technical education by Sir Andrew Noble at the recent opening of the winter session at the City and Guilds of London Institute Central Technical College. Technical education, he said, was of the highest importance, and it was only its abuse that had to be guarded against. One of the greatest abuses was beginning technical education too early in life, by which a boy put his knowledge to practical use before he had learnt how to learn. Another abuse was the divorce of practice from theory and the danger of raising practical application above scientific knowledge. In nine cases out of ten any knowledge acquired by a boy before he was sixteen years of age could have but a slight intrinsic value. Up to that age it was not what he learned that they had to look at but how he learned. It was discipline, self application, and power in attacking a subject that were so valuable, and not generally any definite piece of knowledge he might have gained. Sir John Noble said he was in accord with those who thought the modern languages should supersede the classics as a means of education. In his judgment a boy should not begin seriously studying for his profession earlier than seventeen or eighteen. Referring to foreign competition and methods of study, he said that nearly every requirement in a drawing office could now be better and more economically obtained from Germany. The English mechanic must look chiefly to theoretic and technical knowledge. All German improvements he felt inclined to attribute not, with Sir William Harcourt, to any linguistic superiority, but to the far greater opportunities of technical study afforded in that country.

A Delegate's Amusing Report. THERE was an amusing episode at the last meeting of the Strand District Board of Works. Mr. G. Rees was responsible for it. He had attended the conference of the Sanitary Institute on behalf of the Board, and came to deliver his report. He disposed of this business very briefly by saying that a great many matters of importance were discussed. One matter, however, had not been discussed which ought to have been. He did not know whether his fellow-members had suffered, as he had done, from the intolerable plague of flies which had existed during the past summer. (Cries of "Yes" from several bald-headed gentlemen.) He believed they were a source of disease, as well as a nuisance. They settled on noxious matter in the streets, and then flew into the house and settled in hundreds on the food on the table. Something ought really to be done in the matter. A Member: Does Mr. Rees suggest any remedy against a nuisance? (Laughter.) Mr. Rees said he couldn't, but simply pointed out the plague. A Member: But what can we do? Mr. Walter Emden, L.C.C. (chairman): Order, order. The gentleman must call in a policeman if he has a repetition of such conduct in future. (Roars of laughter.)—The report was then adopted.

A New Requirement. OF late years a fierce invasion has been made by the fair sex of many kinds of employment hitherto exclusively enjoyed by men, and the (so-called) "new woman" has become a fixture. Attacks were first made on men's clothing, and then, gathering strength and confidence from familiarity, the ladies assailed the professions. There was the lady doctor, the lady preacher, the lady architect, and the lady sanitary inspector. From professions, woman went to trades—witness the lady barber, the lady bookbinder, the lady decorator, etc.—and finally gave the crushing blow when she became a "sportsman." All these things have a serious as well as a ludicrous side. Here is a case in point. The Richmond Board of Guardians propose to build a new infirmary and have been in correspondence with the Local Government Board with reference to the plans. At a recent meeting a letter was read from the Board, asking, "Where are the nurses' bicycles to be kept?" The architect, poor man, had not anticipated such a requirement, and admitted that no provision had been made for the nurses' machines. He is only human after all. If nurses are to have special buildings put up to accommodate their bicycles, why shouldn't men have a well-ventilated central repository in which their pipes might be kept? Perhaps the authorities at Whitehall could answer the question.

Irish Marble. AMONGST the many great natural sources of wealth in Ireland, says the "Philadelphia Standard," are her rich and varied marble deposits. During the past year nearly one million dollars' worth of Irish marble, quarried within a few miles of Galway, has been imported into the United States for the decoration of fine public and private buildings. A lavish use has been made of it in the Columbia University buildings, and in the new university club house, Fifth Avenue, New York. In the club house the grand hall is supported by eighteen columns and pilasters of this marble in serpentine and green shades, highly polished and carved in the Celtic school of ornamentation. These columns are 36ft. high and 3½ft. in diameter. This marble was discovered more than a century ago, but the expense of quarrying and hauling it to tide water militated against its use. The late Eugene Kelly, the New York banker, was induced to use a small quantity of it in an office building which he erected shortly before his death, where its beauty appealed to a number of architects, who began to use it. About two years ago a syndicate of Irish-American quarrymen leased the quarry and introduced Sullivan's patent American machinery for quarrying and dressing it at less than one-fifth the cost of the old hand process, and the low prices resulting from the new methods have created a large market for it. A great deal of it is to be used in the new Catholic Cathedral in London and in the Sacred Heart Basilica at Paris.

The "Saracen's Head." Nos. 6 and 7, Aldgate High Street, are, on the authority of Mr. Philip Norman, F.S.A., the last remaining portion of the "Saracen's Head," a well-known coaching house, the history of which goes as far back as 1681. There was until recently another house forming part of the inn, but it has been demolished. The name of the inn was discernible on the front of these houses until a few years ago. Behind the buildings is a yard which was formerly that of the "Saracen's Head," and which was once galleried. The houses are the most picturesque remains of Old London in Aldgate. The fronts are timbered with carved pilasters treated with fruit and flowers. The rooms within, which number about eight in each house, are small and not remarkable save for a pretty little basket grate or two, and a few neat little chimney-pieces, all in the plain good taste of a middle-class house of the seventeenth century. The balustrade at the top rails in the leads, to which doors from the attic stories give access. The premises were sold recently on the death of the freeholder, but were repurchased by a member of his family, and these interesting and picturesque remains are not apparently immediately threatened with rebuilding.

Clerkenwell Parish Church. The Clerkenwell Parish Church was reopened last Wednesday, after its restoration and redecoration. The church is now lighted by electricity, the pews are cut down, the ceiling has been whitewashed, and the pillars have been freshly painted. St. James's, Clerkenwell is an old foundation, dating from about 1100, but the present church was built upon the site of the old one, which was so dilapidated that the Georgian Era despaired of it, and pulled it down in 1792. It was a substantially-built church, but the wear and tear of ninety years laid it open to restoration work in 1881, when Mr. Blomfield, besides recommending the repair of the outside of the church, suggested one or two constructive alterations inside. These were carried out, but only in part. Later decoration and restoration have suggested the removal of the old pulpit and the erection of a light lattice work screen of painted iron, which runs across the step leading up the chancel. The pulpit is now part of the screen.

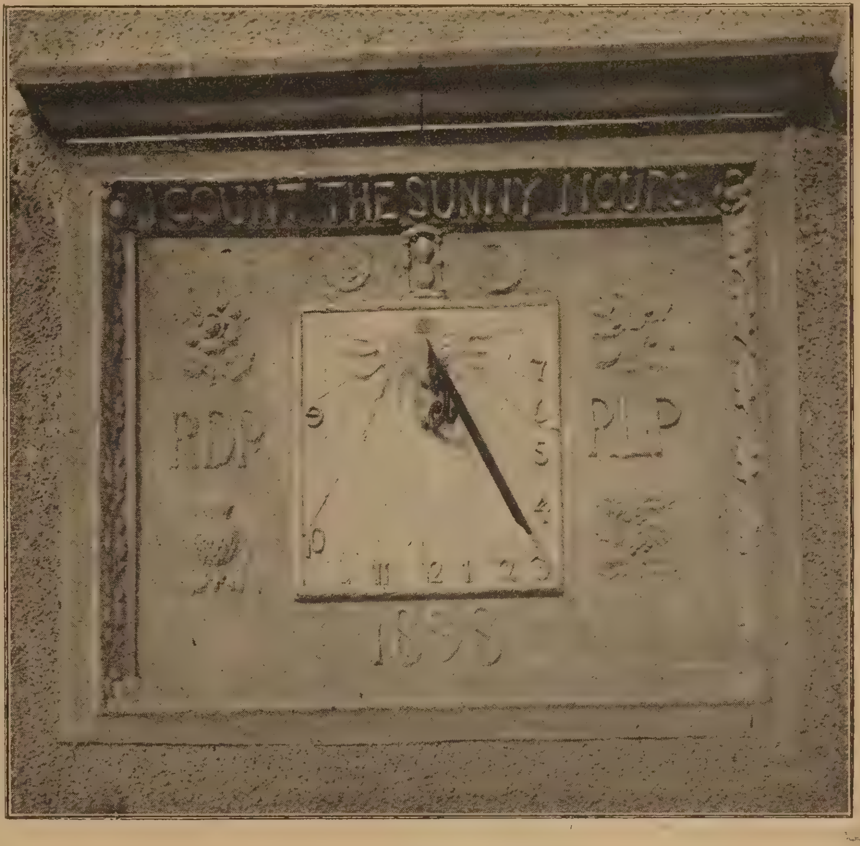
A Forgotten Tunnel. At a meeting of the Langbourn Ward Club, held last Wednesday evening at the London Tavern, Fenchurch Street, Mr. George Threlfall, a gentleman with a penchant for exploring, read a paper on the old underground pneumatic tube that runs from the General Post Office to Euston Station. The tube was built forty-two years ago for the purpose of conveying mails, parcels, &c., by pneumatic dispatch, but the old Pneumatic Dispatch Company, which was started in 1859, was compelled to cease working because it was found that the system of blowing, or sucking, the cars through the tunnel by air pressure, or vacuum was impracticable, owing to leakage of air and other mechanical defects. The tube was made of cast iron sections 1in. thick, and was 4ft. high by 4½ft. wide. It occurred to Mr. Threlfall that if the tube was available it might be used for its old purpose if worked by electric traction. He did not know the exact location of the tube, but after nearly three years' search for information he discovered its whereabouts, and explored it. His suggestion that it should be used for its old purpose, with electricity in the place of air, is a good one, and will, no doubt, be followed up.

Subterranean London. It certainly must have been a subject for conjecture to passers-by when about eighty gentlemen, most of whom were wearing the regulation frock coat and silk hat, emerged from an open grating at the corner of St. Bride Street, Ludgate Circus. These gentlemen were not beings from another world, but simply members of the City of London Tradesmen's Club, who had been personally conducted on a tour through the extensive subways which lie underneath Holborn Viaduct and adjacent thoroughfares. Passing into the subway by means of an entrance under the Viaduct itself, the visitors were conducted by Mr. Liberty, a city inspector of subways, along what appeared to be interminable passages, well ventilated and well lighted, with huge pipes on either side, the uses and capabilities of which were pointed out. The chief feature noted was that by means of these subways, the various companies can carry out their operations without disturbing the surface of the roadway. When it is remembered how the Strand and others of our principal thoroughfares, are broken up by one company after another, it is to be regretted that the system is not applied to the whole of the metropolis.

Views and Reviews.

EXHIBITION AT No. 9, MADDOX STREET.

The depôt just opened in Maddox Street deserves to be noticed, because there is little to be found in the place which is not more than ordinarily good of its kind. Exceptional works which have the stamp of individuality upon them are conceived and executed in very out-of-the-way places sometimes, and it has been felt that a central establishment to which things intended for sale might be sent would be nothing less than a blessing to their producers. You may do all the thinking which art work requires in the place of your birth, and may even be allowed to convert the one sitting-room into a workshop, but can you expect to be pardoned for all the mess that you make if nothing is sold after all? To live with such an accumulation of things made and unsold about one is, to say the least of it, dreary, and often we hear it said that if the *genius loci* only knew where to send them he would empty his place in a moment. (He must be sure of their worth, however.)



SUNDIAL. BY GEORGE P. BANKART.

Let this preamble be pardoned, and let it be said straight-away that a place of the kind we require has been opened. Mr. Fordham, though no longer residing in Birmingham, retains the closest connexion with the "handicrafts guild" of that city, and the nucleus of his collection consists of the work produced by this guild. The prospectus contains the names of some of the best known art workers of our generation, and the exhibition itself not a few of their works. There are things of all kinds, and few that are not commendable. Of Mr. Cockerell's book bindings there can be none more delightful than those he has here. It is unlikely that any surpasses the others as an example of the craft in which he excels, but the nature of the inspiration must be considered, and it is not everyday, I suppose, that treasured collections of letters in manuscript are placed in a bookbinder's hands. It is much to his credit that he has exercised so much reserve in this case, for when a volume is, so to say, sacred, we want to have it to ourselves, and not to have either the name or the work of the binder put foremost. Llewellyn Rathbone, working in Liverpool, sends such a selection as can be conveyed most easily. Of their excellence one need not speak here, for his is not a new name, and his works, not his friends, have established his reputation. Of Mr. H. Wilson's most exquisite jewelry what shall be said excepting that there appears to be nothing within the cycle of the fine arts that he has not essayed of late? Of the craft of speech a past-master, he supplied at short notice the few beautiful things that appear in the book of words for the Masque, recently performed at the Guildhall by members of the Art Workers' Guild, and has probably other surprises in store.

Miss May Morris sends needlework, a splendid embroidered cloth, designed, be it said, by her father, and shows us besides what art there may be in the threading of beads with a view to the effect they may have considered as part of the dress. The accompanying illustration is of a sun-dial. There is poetry in the mere idea of the thing, and it *must* be made beautiful if handled at all, for whoever created the luminant is the Judge of the Song of the Dial. I am told of this work that it is modelled on a bed of concrete, that the gnomon is bronze, and that the initials are those of the owner.

E. R.

A New Primitive Methodist Chapel at Wilsden, Yorks., is being erected, at a cost of £1,300, from designs by Mr. W. R. Nunns.

The Restoration of Wednesbury Parish Church is to be completed by providing a north transept at a cost of £800. Nearly £20,000 has been spent on the building during the last twenty years.

Projected Improvements at Bridlington.—It is stated that the Beaconsfield Estate is to be developed, and that an hotel providing accommodation for 200 guests, a theatre seating about 2,000 persons, and a promenade pier and concert pavilion, are proposed to be built.

Professional Practice.

Airntully.—A new church hall in connection with the Kinclaven Parish Church has just been formally opened. The hall is 31ft. by 17ft. inside, and has an entrance porch at the east end. The walls are framed wood resting on a stone foundation, and finished on the outer face with cement plaster and rough cast. The roof is covered with green slates, the gable projections having ornamental barge boards. The windows, eight in number, are glazed with cathedral glass. Sitting accommodation is provided for upwards of 100 persons, the seats being placed on each side of a centre passage, and there is a platform with a reading-desk at the west end. The ventilation is by hopper ventilators placed in windows, and by a shaft from the ceiling, connected to one of Boyle's air-pump ventilators placed at the apex of roof. The heating is by means of a slow combustion stove, and the hall is lighted by two 100 candle-power lamps hung from the ceiling. The contractors were:—Masons, Messrs. W. and C. Duncan, of Murthly; joiner, Mr. James Mitchell, of Murthly; slater and plumber, Mr. Neil Dow, of Murthly; painter, Mr. Henderson, of Birnam.

Birkenhead.—A new church has been erected in Manor Road, Liscard, at a cost of £5,000, from designs by Messrs. Ware and Rathbone, Dale Street, Liverpool, Mr. James Merritt, of Birkenhead, being the contractor. It is built of Ruabon bricks with white stone dressings, and seats 300 people. The electric light has been installed. Roughly speaking, the building consists of two rectangular halls, one, somewhat the larger, being the church proper, the other the church hall. The choir is separated from the nave by a simple central arch flanked by a smaller arch on each side. The choir stalls are of oak stained a dark green, with designs painted on the ends decoratively symbolic of the four elements—earth, air, fire, and water. The Communion table and the pulpit are also of wood, treated in the same sombre scheme of colour as the stalls, and relieved by figure decorations which supply a richly harmonious effect. The artist who executed these painted decorations is Mr. Bernard Sleigh, of the Bromsgrove Guild of Arts and Crafts. The lectern is constructed of wood and adorned with a conventional palm leaf ornament in beaten copper. This, with the electroliers that hang from the ceiling of the church, is the work of Mr. Walter Gilbert and other artists. The wall at the back of the choir is furnished with a kind of reredos of wood, stained brown, a colour which presents an agreeable alternation to the green of the woodwork in the choir. Above the cornice are six large panels of Della Robbia ware, executed by Mr. Harold Rathbone. At the base of the tower there are four figures carved in stone by Mr. B. Creswick, of Birmingham, typifying Meditation, Eloquence, Devotion, and Music.

Birmingham.—At the end of this month the new Police Institute, at the corner of Dalton Street and James Watt Street, will be opened. It has been the aim of the architects (Messrs. Ingall and Son, of Temple Row) to get the best view from Corporation Street, and in this they have been successful. The building is erected in red brick with terra-cotta dressings. In the basement there is a gymnasium about 50ft. by 27ft., to the right of which is a recreation room. Immediately above is the apartment which is to be used as a reading room and library. The centre of the pile is surmounted by a dome and flagstaff, running to a height of 100ft. from the ground. One of the chief features of the Institute is an assembly room capable of holding 300 people. The decorations are bright and the windows well treated with leaded glass by Messrs. J. R. Lee and Co. Heat is supplied by seven radiators, four on one side and three on the other. Sleeping accommodation is provided, there is a shop at the corner on the street level and the building is fitted with a lift. Mr. T. Johnson, of Great Brook Street is the contractor. Work was commenced in June 1898.

Chorlton-cum-Hardy.—The corner stone of the new church of St. Werburgh, Wilbraham Road, was laid on September 29th. The building is of Gothic design, and will be of brick, with terra-cotta dressings. It is expected to be ready for opening nine months hence. Accommodation is to be provided for 500 worshipers. The architect is Mr. R. Bassnett, Preston, and the contractor Mr. R. Carlyle, Ardwick.

Dundee.—An infectious diseases hospital is to be erected at Whitehills, Forfar, for the Dundee and Forfar districts of Forfar County Council. The sum of £5,000 was stipulated as the limit of cost for building the hospital when the conditions of competition were issued several months ago, but the total cost is estimated to amount to nearly £7,000. Mr. T. Martin Cappon, F.R.I.B.A., of Dundee, is the architect. The buildings consist of a large administrative block, with matron's, doctor's, nurses', and servants' rooms, with kitchen, bathrooms, &c. Immediately on the east and west of the administrative block are placed the isolation blocks with two wards each, and one bed, with nurses' room and bathroom, and a discharge block with undressing and dressing rooms, bathroom, and stores for patients' clothes. The scarlet fever block consists of two wards of eight beds, with nurses' room and pantries, two bathrooms, and closet—all connected with the main buildings by through ventilated passages. The typhoid and diphtheria blocks are provided with two wards of two beds, with nurses' room, bathroom, and other conveniences. The wards are placed on the high ground with a floor space of 50ft. between each building, and are connected with concrete passages. The offices are placed at the back, out of view of the wards, and consist of mortuary, two disinfecting chambers, with parlour and disinfector washing-house, large store, ambulance and van sheds, coal-houses, &c. The whole buildings are to be finished upon plain and simple lines, with first-class material and good workmanship.

Hull.—Holy Trinity Church was re-opened on October 4th after being closed for many months for repairs and restoration. Messrs. Broderick, Lowther and Walker, of Hull, were the architects who had the work in hand. The restoration has consisted in a thorough cleaning of the whole of the interior stonework, which, considering the proportions of the church (one of the largest parish churches in England) was itself a big undertaking. In doing this work no tool has been allowed to be used, the work having been done entirely with brushes, so that the character of the masonry has not been interfered with. The stoves which previously heated the church, and were the cause of agreat deal of the grime which so disfigured the interior of the building, have been removed, and the church is now heated by a low pressure heating apparatus. The electric light has been installed in place of the gas previously used, the lamps being arranged round the caps of the piers of both nave and choir. The fittings have been made as plain and as light as possible, so as not to interfere with the architectural lines of the church, and when lighted the effect is a most brilliant one. The decorations of the nave and aisle roof, which were completely obliterated by dirt, have been thoroughly restored. The removal of the organ from under the tower arch is a great improvement, as the beautiful transept windows can now be seen on entering the church. The cleaning of the interior has been done by Messrs. Bowman and Son, of Stamford; the heating by Messrs. Haden, of Trowbridge; the electric light is by Messrs. King and Co., of Hull; and the decorations are by Messrs. Dreyer and Co., of Hull. The contract for the repairs to the exterior of the church has been given to Messrs. Quibell and Son, of Hull, but owing to the strike the work has not been commenced. The total cost of the restoration will be about £4,000.

Loughborough.—A new infants' department has just be added to the Rosebery Street Schools from designs by Messrs. Barrowcliff and Alcock, of Loughborough. It comprises a school room, 50ft. by 25ft.; three class rooms, each of ample dimensions; a teachers' room, and a cloak room 26ft. by 18ft. The floors are composed of wood blocks, and the walls have a tiled dado. The building is heated throughout with hot water, in conjunction with the original school, and there is also an open fireplace in each of the class rooms and two in the school room. The height of the class rooms is 13ft. 6in., and of the school room 15ft. 6in. to the wall plate, and 19ft. 6in. to the ceiling. The class rooms open out into the main room, and have glazed screen partitions. The length of the old and new building from Rosebery Street to George Street is 206ft.

Newcastle-on-Tyne.—The new Central Primitive Methodist Church in Northumberland Road, was opened on Wednesday. The design of the church is in the Perpendicular Gothic style, and at the east corner there is a tower, which rises to a height of 120ft., and adds another to the numerous landmarks of the city. The church fronts into Northumberland Road, and is entered by a handsome doorway, above which is the window placed by Mrs. Stewart in memory of her husband, the late Ald. Stewart. On the ground floor there is sitting accommodation for 500 persons, and in the gallery, which is of horse-shoe shape, for 300. An interesting feature in the interior design is the projecting of the gallery by means of steel cantilevers, from the massive stone pillars running along the sides of the building, thus doing away with the use of iron columns, in front of the pews. From every pew there is thus a free and uninterrupted view of the preacher; the space behind the pillars being utilised as aisles, and forming a row of arches. The pulpit is conveniently placed, having behind it a space for the organ and choir. The school buildings are in Ridley Place, but are connected with the church. They consist of a large school room, with a gallery round three sides, supported by steel girders, as in the chapel. One part of the school gallery is divided into class spaces by screens and curtains. Other apartments include a church parlour or lecture hall, library, infants' school, stewards' or minister's vestry, classrooms, and caretakers' house. The principal contractor was Mr. A. Bruce, of Brighton Grove, and the sub-contractors were:—Plastering, Mr. Tubb; slating, Mr. J. Hewitson; heating and ventilating, Mr. J. Rowell; electric lighting, Mr. T. G. Usher: painting and glazing, Messrs. Adam Robertson and Son; seating, North of England School Furnishing Co. The wood-block flooring and mosaic were provided by Mr. J. F. Ebner, of London. The architect was Mr. T. E. Davidson, and Mr. W. Moore acted as Clerk of the Works. The stained glass window over the entrance has been executed by Mr. G. Baguley, of Newcastle. The window contains twelve lights and tracery. The subjects, each of which are illustrated in two lights, are the following:—"Our Lord blessing children," "The Sermon on the Mount," "Come unto Me all ye that labour and are heavy laden, and I will give you rest," "The Good Samaritan," "The Parable of the Talents," "Christ healing the sick." The tracery contains the Crucifixion, the Transfiguration, and the Ascension.

Old Trafford.—On September 28th Sir Humphrey de Trafford laid the foundation stone of a new technical institute and public library about to be erected by the Stretford District Council. The new building will occupy a prominent position at the corner of Stretford Road and Northumberland Road, and will be of brick with terra-cotta facings. The architect is Mr. W. Thorpe, of Manchester. It will provide, in addition to library and reading-room, a hall capable of holding about 600 people, as well as provision for the technical instruction classes now carried on by the Council at various elementary schools. The total cost, including furnishing, will amount to about £8,000.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

CUMBERLAND SLATES.

To the Editor of The Builders' Journal.

Clapham, S.W.

Dear Sir,—I should be glad to know the name of a firm who would supply the "Earles (or Ells) Water" Green Cumberland slates.—Yours faithfully,

AN ARCHITECT.

Apply to the Elterwater Green Slate Co., Ltd., Great Langdale, Ambleside, Westmoreland.

STRENGTH OF WROUGHT-IRON GIRDERS.

To the Editor of The Builders' Journal.

Bideford.

Dear Sir,—Will you kindly give me a formula for determining the strength of wrought-iron girders, and describe the method of working them?—Yours faithfully,

H. W.

See the article on "Wrought-Iron Beams" which appeared on page cxxvi of the Supplement to The Builders' Journal for May 24th last, No. CCXXIV., and also the letter referring to this article on page 251 of No. CCXXV.

ARCHITECTURAL LETTERING.

To the Editor of The Builders' Journal.

Newcastle-on-Tyne.

Dear Sir,—Would you kindly consider my suggestion of having some specimens of architectural lettering in your valuable paper, as I think this would be of great help to many besides myself?—Yours faithfully,

PUPIL.

We are obliged for our correspondent's suggestion, but cannot find space for such an article at present. "Alphabets, Old and New," by Lewis F. Day (3s. 6d., B. T. Batsford, 94, High Holborn, W.C.), is a good book on the subject.

BUILDING CONSTRUCTION EXAMS.

To the Editor of The Builders' Journal.

Mansfield.

Sir,—Is it compulsory for a student to hold a first-class certificate in the elementary stage of building construction before sitting for the advanced stage examination in the same subject? I have obtained a second-class certificate in the elementary stage, and would like to sit for the advanced stage at the next examination if possible: South Kensington Science and Art Examination. STUDENT.

It is not necessary to hold a first-class (elementary) certificate in order to be able to sit for the advanced. "Student" might take the latter examination without even having entered for the former. R. W. C.

TIMBER COTTAGES.

To the Editor of The Builders' Journal.

London, W.C.

Dear Sir,—I should be much obliged if you would inform me of the best reference book dealing with the construction of timber cottages. Also, which is the best material—tiles, plaster, or weather-boarding—for enclosing a wooden cottage erected on an exposed site on the south coast.—Yours faithfully,

E. M. B.

The construction of timber cottages does not differ in the least from that of any other building. Timber and tile work is dealt with in "Rivington" Vols. I. and II. and any other book on construction. The best material of the three mentioned for enclosing the cottage is tiling, but if the situation is *very* exposed, it would be preferable to see the tiling backed by brick rather than by woodwork.

R. W. C.

A RETAINING WALL QUERY.

To the Editor of The Builders' Journal.

Sir,—A street is about one in twelve out of level. Each tenant has levelled his land for building and has erected a retaining wall to keep up his neighbour's land. The retaining wall on A's land is about 8ft. high, is in a dilapidated state, and about 1ft. 6in. out of level. Owing to this, B's outhouse has gone with it, and is also in a dangerous condition; there is a party wall beyond. Will you kindly say if A is responsible for all damages, not only to his retaining wall but also to the wall of B's outhouse?—Yours truly, X. Y. Z.

The point is a nice and difficult one, but I should be inclined to think that A is liable.—H.P.B.

FORMULA FOR RETAINING WALLS.

To the Editor of The Builders' Journal.

Bideford.

Dear Sir,—Kindly explain how to work out the value of K used in designing retaining walls for earth when the following formula is used:—$T = K H \sqrt{\frac{w}{W}}$; where $K = 0{\cdot}7 \tan \frac{90-45}{2}$—Yours faithfully, H. WILSON.

The fraction $\frac{90-45}{2}$ is equivalent to 22½, which is the angle in degrees. By reference to the table of natural tangents, in Chambers' Mathematical Tables, under 22 degrees and opposite 30 minutes the value of the tan will be found to be 0·4142136, and multiplying this by 0·7, or taking seven-tenths, the value of K is found to be 0·28994952.

HENRY ADAMS.

REGISTERING PLANS.

To the Editor of The Builders' Journal.

London.

Sir,—I am about to erect some small houses, the plans of which possess some original ideas. Previous to doing so I wish to know whether it is possible, by registering or otherwise, to prevent others copying the plans and using them for the purpose of building similar houses after mine have been erected.—Yours faithfully, X. Y. Z.

So long as the plans in question are not published—making use of them for the building of the house is not publication—no one is at liberty to make a copy of them. But if X. Y. Z. publishes them, *e.g.*, by engraving and circulating them, he must register them, or he cannot prevent any person from copying the published plans. Unless the new ideas are capable of being patented, and are patented, anyone who obtains a knowledge of them can utilise them. H. P. B.

ANGLE BARS.

To the Editor of The Builders' Journal.

Bewdley.

Sir,—Kindly inform me whether angle bars made with 2in. sides are strong, and what is the ordinary length?—Yours truly,

C. J. W.

Angle bars of iron or steel can be had in all sizes from 1½in. by 1½in., to 6in. by 6in., and Measures gives the stock lengths of 2in. by 2in. steel as 25ft., and the weight as 4⅛lb. per foot lineal. "Strength" is a very general term, and what might be considered strong for one purpose might have to be considered very weak in other circumstances. Angle bars of 2in. by 2in. section are rolled from $\frac{3}{16}$in. to ½in. thick. The former would weigh about 2½lb. per foot lineal, and the latter about 5¼lb. The stock size quoted above would appear to be of ⅜in. thickness. H. E.

BOOKS ON SCOTTISH ARCHITECTURE.

To the Editor of The Builders' Journal.

Sir,—Kindly say which you consider to be the best books on "Scottish Architecture," both ancient and modern. Please give prices and state where the books may be obtained.—Yours truly, A. S.

The best book on Scottish architecture is "Billing's Baronial and Ecclesiastical Antiquities of Scotland" (four vols., £6 10s.) No cheap books on the subject have been published. Perhaps Mr. Small's "Old Stirling" (£2 2s.) would suit. Both these books are obtainable from B. T. Batsford, 94, High Holborn, W. C.

BUILDING PROXIMITY.

To the Editor of The Builders' Journal.

Altrincham.

Dear Sir,—I shall be greatly obliged if you will kindly furnish me with the following information:—(1) In the case of a building having enjoyed the rights of light for more than twenty years, what proximity of adjoining buildings constitutes an obstruction to that light?—that is, how near can another building be erected to it without creating an obstruction? I am told it must be confined below an angle of 45deg. from the base of the building. Is this angle and point of measurement correct? (2) The building in question has large area windows on one side to light the basement. How would these affect the question of obstruction on that side?—Yours sincerely, F. R. P.

(1) There is no limit of nearness, and there is no particular angle; but the fact that 45deg. are left unobstructed may, under ordinary circumstances, be considered *prima facie* evidence that there is not likely to be material injury caused by the obstruction. It is, however, in each case, a question of fact what is the amount of obstruction. (2) Area windows have the same right of light as any others.

H. P. B.

RIGHT OF BUILDING AGAINST PINE END.

To the Editor of The Builders' Journal.

Llanddarog.

Dear Sir,—I shall be much obliged if you will give me your valuable advice on the following questions:—A client of mine some time ago gave out a contract to build a pair of villas. The contractor who built them is now building on the next plot to them. He offered about half the fair value of half the pine end, which my client refused to accept. He now says that he will build a 4½in. brick wall tight against the pine end. (1) Can he legally do so, or is he not supposed to leave a clear aperture right between the two walls? (2) By building a 4½in. wall he would derive support from my client's wall, and would he not be liable to pay compensation for same? He has already built a portion of his front wall tight up against the pine end in question.—Yours faithfully, A. I. J.

(1) Everyone is entitled to build right up to the edge of his own land and to carry the structure up to any height, provided it is perpendicular and does not interfere with existing rights to light and air. So long as this power is not exceeded, no space need be left, unless there be some valid by-laws in force in the locality to the contrary. The validity of such a by-law, however, would be more than doubtful. (2) No. H. P. B.

THE ACCEPTANCE OF TENDERS.

To the Editor of The Builders' Journal.

Norwich.

Dear Sir,—I shall be glad if you will advise me on the following matter:—On September 6th I tendered for work at Cromer, under the Cromer Urban District Council. I received on September 12th a letter saying that my tender had been accepted, and in the report of the Council meeting in the local paper this was confirmed. In consequence of a letter I received from the Council I saw a

Mr. Scott, who told me that only two tenders had been received for the work, and that mine, being the lower, was accepted. As my price was much above his estimate, he requested my quantities to see if I had made any error. I assented to this, and later received a letter from the Council informing me that owing to the amount of the tenders very much exceeding the provisional apportionments, they had decided to re-advertise the contract. Is this a correct way of proceeding, and have I any remedy? I have suffered in my business on account of the action of the Council, and the matter is a serious one to me.—Yours faithfully, H. J. S.

The correspondent has no remedy, as there was no contract binding on the Cromer Urban Council. He must only make the best of a bad matter. H. P. B.

BOOKS ON MARBLE WORK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you recommend any book which will enable me to get at the prime cost of work done in stone and marble (especially in marble), describing also the tools and processes adopted in working these materials. Further, I should like to know where I could obtain the fullest information on the subject of marble decoration, &c., with practical hints on design and construction.—Yours truly, ROUGE.

Macey's Specifications or Stephenson's Estimating will be found useful. The text book on marble work by Lee is out of print. "Marble Decoration and the Terminology of British and Foreign Marbles," by George H. Blagrove (post free 3s. from B. T. Batsford, 94, High Holborn, W.C.), is a good book on the subject.

CALCULATING COMPRESSION MEMBERS OF ROOFS.

To the Editor of THE BUILDERS' JOURNAL.

LIVERPOOL.

DEAR SIR,—Will you kindly inform me through the columns of your valuable journal if there is any formula for calculating the section of rods and T-irons for struts and principals in a steel roof when the weight or stress has been found? I do not want to use tables, &c.—Yours truly, STEEL ROOF.

There are various formulæ for this purpose but they are all somewhat complicated for a beginner. It is well to get an approximate idea of the size required before using a precise formula to test the strength. Thus the safe load in tons per square inch on a compression member of roof in mild steel may be taken as $= 5 - \frac{\text{length in.}}{10 \times \text{least width in.}}$ Gordon's formula is $W = \frac{c\,S\,f}{1 + \frac{l^2}{a\,d^2}}$ where W = safe load in tons. c = constant for material, say 16 for wrought iron and 24 for mild steel. S = sectional area in square inches. f = factor of safety, say $\frac{1}{4}$. l = unsupported length in inches. a = constant for shape of section, say 1,500 for cross, angle, or tee, if both ends are fixed by two or more rivets. Take $\frac{a}{2}$ for one end fixed, or $\frac{a}{4}$ for both ends pivoted. d = least diameter or breadth in inches. Example: Steel roof, length of member 4ft., thrust 3·5 tons, one end pivoted, the other fixed. Approximate section, $5 - \frac{48}{10 \times \text{say } 3} = 3{\cdot}4$ tons per square inch. $\frac{\text{Thrust}}{\text{Intensity}} = \frac{3{\cdot}5}{3{\cdot}4}$ = say 1·03 square inches area required. By reference to page 151 of "Designing Ironwork," $2\frac{1}{4} \times 2\frac{1}{4} \times \frac{1}{4}$ angle or tee is found as the minimum section, being 1·06 square inches area. Strength of this section by Gordon's formula,

$$W = \frac{24 \times 1{\cdot}06 \times {\cdot}25}{1 + \frac{48^2}{750 \times 2{\cdot}25^2}} \doteq \text{say four tons, which}$$

allows a fair margin. HENRY ADAMS.

CLONFERT CATHEDRAL.

THIS Cathedral has, during the past few years, been under restoration at the hands of Mr. J. F. Fuller, F.S.A., architect. The chancel has been thoroughly restored. The decayed wooden flooring has been removed, and specially designed tiles laid down, and the plaster has been taken from the walls of this part of the building and the ancient stonework pointed and repaired. Stone mullions have been placed in the windows. Two of the windows have been filled with cathedral glass, and six with stained glass. The red paint has been removed from the stone pillars of the ancient east window, and also from the stonework of the chancel arch, and from the stonework of other parts of the building. A bishop's throne of carved oak, in memory of Bishop Young, has been erected in the chancel. Two two-light stained glass windows, by Messrs. Watson, of Youghal, representing the four Evangelists, have been placed on the south side of the chancel. The "Meath" Protestant Industrial School, Blackrock, having expressed great interest in the restoration of Clonfert Cathedral, the committee of the institution presented a handsome Communion table of carved oak to the cathedral, specially made by the boys of the school, in accordance with Mr. Fuller's design. Two stained glass windows, by Messrs. Hardman, of Birmingham, representing St. Peter and St. Paul, have been placed at the east end of the Cathedral. A brass Communion rail, designed by Mr. Fuller, has been erected in the chancel. Suitable stone steps have been placed in the chancel. The sacristy has been thoroughly restored without altering the ancient character of the structure. The modern plaster has been removed from the walls, and from the ceiling, thus bringing to light the marks of the old hurdle roofing. The roof and the floor have been concreted. New windows, new doors, and a new stove have been placed in this part of the Cathedral. A thorough system of drainage has been carried out around the entire building. The roof of the fabric has been repaired. The belfry tower has also been repaired. New landings had to be erected in the tower, the old ones having become quite decayed. Other necessary work has also been done. During the last few months the work of restoration of the nave has been undertaken. The old high-backed square pews have been removed, and the gallery at the west end has been taken down. Several arches, which had been filled up, some with brick and others with lath and plaster, have been opened out, and the plaster has been removed from the walls of the nave. These walls, which are in many places cracked, and in very bad repair, are now being carefully pointed and restored. There were originally two transepts; one is now in ruins and roofless, the other is completely gone. During the progress of the work in the nave, the stone arches of the transepts, which had been completely covered with plaster, have been brought to light. On removing the plaster from a portion of the walls of the vestibule of the Cathedral, some fragments of elaborately carved stonework were discovered. The greater part of the work of the restoration of the Cathedral has been carried out by Messrs. Sharp and Emery, of 17, Great Brunswick Street, Dublin. £1,467 18s. 4d., have been already subscribed towards the cost of the work, but it is estimated that £2,000 will be required to complete it—£1,000 of this amount for the restoration of the nave, and £1,000 to rebuild the transepts. It is proposed, also, to carry out the repair of the stone groining of the arch over the vestibule; to have the floor of the nave, sacristy, and baptistry laid down with encaustic tiles of a special design; to have the nave re-seated with suitable chairs; to have stone mullions placed in the windows of the nave, and to erect additional windows of stained glass in the chancel, sacristy, and nave; and to provide a new entrance door of oak of appropriate design. The Cathedral is situate in Co. Galway, and was founded in the sixth century.

Keystones.

A New Technical Institute at Hoxton is being provided by the London County Council, who have purchased a large school from the Drapers' Company at a cost of £23,000.

Grand Stand Unroofed at Dundee.—The roof of the grand stand of the Dundee Football Club was completely blown off during a recent heavy gale. The repairs will be costly.

The Organ in the Temple Church, one of the oldest in the kingdom, is being repaired. It is said that most of the old pipes are in as good a condition as they were two hundred years ago.

Relics of an Ancient Church.—The foundations of an earlier chancel and a very early piece of stonework have been discovered at Ashmansworth Parish Church, where some mural paintings dated 1200 A.D. were recently found.

Exhibition at the Holland Gallery.—The first of the autumn art exhibitions proper opened on October 5th at the Holland Fine Art Gallery, Regent Street, W. Works by Sir Alma-Tadema, James Maris, Anton Mauve, Mesdag, and Bosboom are included among the exhibits.

Peace and its Representative.—One of the most prominent of the New York decorations is a sculpture of a village blacksmith at work under a spreading chestnut tree. The intention of the sculptor was to represent Peace; he took for his model Fitzsimmons, the pugilist.

A Big Difference.—In July, 1896, the borough surveyor of Brighton estimated that the proposed alteration to the public library and museum would cost £29,244. The amount of the lowest tender now made is £40,679! The Committee have advertised for fresh tenders.

The Recent Masque at the Guildhall was a financial failure, as there was a net loss of £1,200. Owing to the restrictions of the London County Council, which limited the number of persons to be admitted to each performance to 500, the proceeds of the sale of seats fell far below anticipations.

Workington's New Town Hall.—The first prize for competitive designs and plans for this building has been awarded to Messrs. Oliver and Dodgshon, of Carlisle and Leeds, who will carry out the work. The second prize has been awarded to Mr. T. Cook, architect and surveyor, Manchester, and the third prize to Messrs. Moffatt and Bentley, architects, Whitehaven.

The "Church of the Protestation," now nearing completion at Spires, Germany, as a memorial of the origin of the name "Protestant" at the famous Reichstag in that city in 1529, will have a huge tower containing the "Hall of the Free Cities." A sum of 600 marks has been collected towards the cost of the sculptured armorial bearings in this hall in each of the thirteen cities that signed the "Protest."

A Handsome Memorial Brass to the memory of the late Rev. C. W. Lohr, has been erected in the church at Alburgh, Norfolk. The designer of the brass is Mr. W. R. Weyer, Bank Street, Norwich, and the engraver is Mr. Harold East. The border of the brass is treated with conventional Gothic foliage, and arranged in three canopies, with elaborate foliated and crocketed finlials in relief, in the centre of which is a Gothic cross surmounting an inscription.

The Glasgow School of Art, 167, Renfrew Street and 11, Dalhousie Street, Glasgow, has arranged a very strong series of classes for the winter session, from the 16th inst. to January 27th. In connection with the architectural classes there are offered for competition two bursaries of £5 each, two bursaries of £10 each, two travelling studentships of £50 and £60 respectively, and numerous other prizes. Prospectuses can be had from the Secretary at 167, Renfrew Street.

Paisley Abbey is proposed to be restored at an estimated cost of £35,000.

Landslip at Cromer.—About 150,000 tons of the cliff contiguous to the golf links at Cromer fell on October 4th.

The New Imperial Theatre, Bordesley, has just been opened. It has been erected at a cost of about £25,000.

St. Deniol's Library.—The Duke of Westminster laid the first stone of this building at Hawarden on October 5th.

A New Church School at Chorley is to be built at a cost of about £1,800. The foundation stone has just been laid.

New Theatre at Perth.—The ceremony of laying the memorial stone of a new theatre at Perth was performed last Friday by Mr. George Alexander.

Three New Lancets are to be added to the "Archbishop's Window" in Gray's Inn Chapel. The three new lights will represent Wake, Whitgift and Juxon.

The Arts and Crafts Exhibition was opened at the New Gallery, Regent Street, W., on Monday last. A special criticism of the exhibits will appear next week.

Cheyne Walk, Chelsea, is at present a somewhat narrow thoroughfare, varying from 26ft. to 40ft. in width. It is proposed to give it a width of from 40ft. to 60ft.

A Bust of Lord Audley is to be placed in the new Town Hall which is being erected at Colchester. The bust is the gift of the legal practitioners of the borough.

Mr. James Hutcheson, granite merchant, King Street, Aberdeen, died last Saturday week. Mr. Hutcheson was employed at the building of Balmoral Castle.

St. Andrew's Church Hall, Wembley, which has just been erected for the Presbyterians, was opened last week. It has seating accommodation for about 300 persons.

New United Presbyterian Church at Abbeyhill.—The foundation stone of a new United Presbyterian Church at Abbeyhill was recently laid by the Rev. Dr. John Smith.

The Sanitary Inspectors' Association held its annual general meeting at Carpenters' Hall on Saturday night. Mr. W. H. Grigg (Fulham) was elected as the new Chairman of the Council.

Erratum.—At the top of the second column of page 133 of last week's issue Mr. H. A. Gribble's name was, owing to a printer's error, given as "Fribble." We regret that this mistake should have been made.

A New Rectory adjoining St. Alban's, Cheetwood, is to be erected at a cost of about £2000. The levelling and fencing of the whole of the land belonging to the church, at an additional cost of £3,000, is also contemplated.

Architecture at the Grocers' Exhibition.—One of the principal attractions at the Grocers' and Allied Trades Exhibition at Islington was a bungalow, the roof, walls, windows, ornaments and furniture of which were of soap.

A Landslip at Dover Harbour Works occurred late on Friday night while the work of removing an overhanging cliff in the neighbourhood of St. Margaret's was in progress. Several hundreds of tons of chalk fell, completely burying the workmen.

The Adorning of the Streets and Squares of Frankfort with works of sculpture is to be carried out, and Dr. L. Gans has presented to the municipality of the city the sum of 150,000 marks to form the nucleus of a fund for the purpose. Others have contributed, and the municipality is now in a position to spend 6,000 marks annually on the beautification of the city.

Proposed Improvements at Manchester, to cost £945,000.—On October 4th the Manchester City Council sanctioned application being made to the Local Government Board to borrow £60,000 for a new small-pox hospital, £25,000 for the purchase of a plot of land in a crowded part of the city, and £860,000 in connection with the municipalisation of the tramways, referred to last week.

Llanishen Church, Cardiff, is to be extended from designs by Mr. Douglas Blessley, architect, of Cardiff, at a cost of about £1,400.

The Largest Cotton Mill in existence has just been commenced at Manchester (New Hampshire). It will be 1,600ft. long and 100ft. wide.

Electric Lights on the Nelson Column are, it is stated, to be used by the Navy League on the occasion of the forthcoming celebration of the Battle of Trafalgar.

New Manchester Theatre.—The foundation stone of the new Victoria Theatre at Lower Broughton, Manchester, was laid by Sir Henry Irving on October 4th.

New West-End Church.—The Royal Commissioners of the Exhibition of 1851, have provisionally granted an excellent site for the erection of a new church near Queen's Gate, London, W.

New G.P.O. Dining Rooms have been provided at a cost of about £25,000 by the adaptation of a commercial block of premises, having frontages to King Edward Street and Angel Street, E.C.

Change of Title.—Mr. John Byford, lime, cement, brick, and fire goods merchant, of Poplar, London, E., has taken his son into partnership, and in future the firm will be known as John Byford and Son.

Mr. Alfred East, A.R.A., was entertained to dinner at Kettering, his native town, on October 3rd, when he said that no nobler character than the late Lord Leighton had ever graced the profession.

The Belfast Art Society opened its nineteenth annual exhibition of paintings and sketches in the Art Gallery of the Belfast Free Library on October 4th. The exhibition will remain open for a month.

A New Workmen's Mission Hall at Sheffield has been built in Norfolk Street from designs by Mr. J. D. Webster, architect, at a oost of £4,000. The contractor was Mr. James Fidler, of Savile Street.

The Highest of European Hotels will be the one now being built on the summit of the Collodi Gigante, in the Savoy Alps. It will be three stories high, and will be provided with a powerful electric search light.

A Memorial to Simon de Montfort, in the form of an equestrian figure in bronze under an aluminium canopy, with other figures grouped around on a grey Cornish granite base, is proposed to be erected at Evesham.

Municipal Dwellings for Ealing are proposed to be erected at a cost of £37,300 on a site at the corner of Ealing Road South and Pope's Lane (now under contract for purchase). The site will allow 121 cottages to be erected.

Vacancy at King's College.—The Professorship of Architecture and Building Construction at this college has fallen vacant, owing to the death of Professor Banister Fletcher. Applications will be received up to Saturday, October 21st.

The Woodpeckers Art Club and the Art Circle, at Norwich, are both holding their autumn exhibitions of members' work, the first named in a top room over Coleman's premises, on Bank Plain, and the latter at their usual room in Exchange Street.

A Monument was unveiled at Margate last Wednesday, which has been erected on the sea front to the memory of the nine men whose lives were sacrificed in the surf boat disaster on December 2nd, 1897. The monument is surmounted by a bronze figure of a lifeboatman overlooking the Nayland Rocks (the scene of the disaster), and is the work of Mr. Calcott.

Memorial to Sir Sydney Waterlow.—The committee formed for the purpose of erecting a suitable memorial in Waterlow Park, Highgate, to Sir Sydney Waterlow' have decided that it shall take the form of a bronze statue of Sir Sydney, on a granite pedestal, and have commissioned Mr. Taubman to execute the work, which will cost about £1,000. The statue will probably be placed on the lawn in front of Lauderdale House.

Fall of a Church Steeple at Wigan.—During a recent severe gale the steeple of the Holy Family Church, Platt Bridge, fell through the roof, doing great damage. Had the mishap occurred an hour later many worshippers would have been in the building.

A New Methodist Chapel at Washwood Heath is being built by Mr. T. Johnson from designs by Messrs. Ingall and Son. The building will seat 400 persons, and will cost about £3,000. It is to be in modern Renaissance style, of red brick with facings of gray terra-cotta.

St. Peter's Church, Hepworth, Suffolk, was re-opened recently by the Bishop of Ely. It suffered considerably from a disastrous fire, which occurred about eighteen months ago, and has now been restored at a cost of over £2,000. The church is in early English style, and is an interesting building.

A Collection of Ecclesiastical and Educational Art was opened by the Bishop of London last Saturday at the Imperial Institute. The exhibition will remain open until next Saturday. Many antiquities have been lent for exhibition, and stained glass, embroidery, carvings, metal work, and other decorative examples are on view.

Sandringham House and York Cottage' Sandringham, have recently been lighted with the Welsbach incandescent gas light. The former ornamental fittings have been preserved as far as possible. In the private apartments of the Prince and Princess of Wales the "Surprise" pendants have been at a introduced.

"The Registration of Architects" is the subject of the debate that will take place at the first meeting this session of the Discussion Section of the Architectural Association, to be held at 56, Great Marlborough Street, W., on Friday, October 13th, at 7 p.m. Messrs. G. A. T. Middleton and A. R. Jemmett will open the debate.

The Sussex Archæological Society visited the Roman city of Silchester last Wednesday, and inspected the recent excavations. They previously went over the Reading Museum, where the antiquities found at Silchester are deposited. The Roman remains, the walls, gates, and excavations, were described by Mr. W. H. St. John Hope.

A Stained Glass Window has been placed in the tower at the west end of St. Saviour's Church, Hockley, in memory of the late Rev. M. Parker. It is a single figure window, with the Ascension as its subject. The work was executed by Messrs. Hardman The church itself has just been thoroughly cleaned and decorated, and the organ rebuilt.

A New Organ at M'Cheyne Memorial Church is being built by Mr. John R. Miller, of Dundee, from the specification and under the supervision of Mr. David Stephen. The organ consists of two manuals and pedals, and is fitted with tubular pneumatic action throughout, both for keys and stops. The bellows is actuated by one of Melvin's water-engines, and there is also a hand lever for use in emergency. The case is of yellow pine, and has been made to designs furnished by the architect who had charge of the structural alterations required for the erection of the organ. The console board is built apart from the body of the organ, and is fitted with radiating and concave pedals.

Roman Pavement at Dorchester.—A county meeting was held at Dorchester recently, on the site of the recently discovered Roman pavement, with the object of considering the advisability of acquiring the relic. The owner of the land on which it was found offered to sell the pavement to the county for £500, on condition that it was removed to the county museum, or, as an alternative, he was prepared to sell the pavement and the adjoining premises for £1,500. A communication from the British Museum suggested that the pavement should remain in its present position and be carefully preserved. A resolution was unanimously passed that the pavement should not be allowed to leave the county, and a committee was appointed to consider the best means of acquiring it.

The Picture of the Thanksgiving Service outside St. Paul's Cathedral on Jubilee Day, 1897, is to be presented by the donor, Mr. Henry Clarke, to the Lord Mayor as representing the Corporation, next Wednesday, and it will be hung in the Art Gallery of Guildhall as a souvenir of that memorable event. Mr. A. C. Gow, R.A., is the artist.

CISTERNAGE AND CONSTANT WATER SERVICE.*

By H. ALEXANDER, Chief Sanitary Inspector, Shoreditch.

THE use of cisterns in conjunction with the constant water service is one of the subjects suggested by authority for discussion at this Congress, and I venture to think that amongst sanitary inspectors it will readily be agreed that it is a subject of high importance to the public health, and one upon which, from our daily observations, we are well qualified to speak and to give counsel.

The quality of the water supplied for domestic use to a community has always been a matter of great concern to those interested in public health, and the highest efforts of engineering science have been devoted to capturing pure supplies drawn from mountain lakes—or raised from subterranean sources—until now we are probably within measurable distance of the time when no community will be dependent upon a water supply drawn from a questionable source. Unfortunately, while science is doing, and has done, all that it is permitted to do in bringing pure water to our doors—it has stopped there—until quite recently no improvement has been effected in the domestic cistern; so that to-day, however pure may be the source of supply, however high may be the standard of purity in water when delivered from public mains, its measure of purity when it reaches the consumer's lips depends entirely upon the character of the cistern in which it has been received and stored. That being so, there are

Three Questions

which seem naturally to arise, upon which public opinion stands somewhat in need of guidance and direction:—(1) Are cisterns necessary in conjunction with the constant supply? (2) Are the cisterns in ordinary use properly adapted for the purpose of storing and protecting drinking water from pollution? (3) What should a cistern be in order to give a perfect measure of security against its contents being polluted?

I have given the question of cisterns in conjunction with constant supply precedence, because it is pretty certain that at no very remote period intermittent supply will be entirely discarded, and constant supply will become universal; and if we bear in mind the varying conditions under which water is obtained, and the exigencies of its distribution throughout the country, we shall probably agree that the question of cisternage in conjunction with constant supply is a great practical question, upon which the interests of the public health largely depend. The transition from the intermittent supply to the constant service has been hailed by many householders as an opportunity enabling them to dispense with their unsuitable and objectionable cisterns altogether—while by other householders, and proprietors of hotels, restaurants, clubs, and other institutions, they have been retained for supplying the flushing arrangements of water-closets, baths, &c., but mainly for holding a store of water in reserve for use when, for any reason, the constant service may be temporarily suspended, drinking water being drawn direct from the main supply pipe. That is all very well, in either case, while the service is maintained, but when the service is suspended, as it frequently is, especially in the metropolis, it is altogether otherwise, and very much so where no storage cistern is retained; for the requirements of water-closets and boilers, in addition to other household necessities, are in no way diminished at such times; on the contrary, it very often happens that the demand is greatest when the supply is least, and that great nuisances arise, occasioning hardship. On the other hand, where a cistern has been retained to secure a reserve store, and where drinking water is drawn direct from the main, a long time may elapse before it becomes necessary to draw for drinking purposes upon the reserve store, during which time it would be safe to say that generally very little attention is paid to the condition of the cistern; and as carelessness and thoughtlessness have always characterised the average householder, in reference to the condition of his cistern, there is great danger that he and his household, and the "stranger within his gates," may unwittingly drink water drawn from a foul cistern, when for a time they are unable to draw from the main.

If it may be assumed from these considerations that reserve store cisterns in conjunction with the constant service are necessary, it follows equally that such cisterns must be properly adapted for their purpose, and that brings me to my second question—Are the cisterns in ordinary use properly adapted for storing and protecting drinking water from pollution? To that question I am perfectly sure that there can only be one answer, from a sanitary inspector

It is therefore certainly not with a view to imparting information to you, that I ask you to take into your consideration what

The Ordinary Domestic Cistern

is, but rather that we may fulfil in our degree the purpose of this Health Congress, by arousing and directing public attention, if so we may, to the dangerous conditions attendant upon, and indeed inseparable from, the cistern in ordinary use; conditions with which ages of neglect have familiarised the public to such an extent that a deposit of filth in the bottom of a cistern is accepted by many people as if it were the product of an inexorable law of nature, rather than an effect arising from causes that ought to be removed.

Cisterns in olden times were formed of stone or slate, of lead or of cast iron; later on they were constructed of wood lined with lead or zinc, but in these latter days they are generally constructed of galvanised iron, a material that is generally accepted as being perfectly satisfactory; but whether we have progressed as to the material employed or not, there has been no progress until very recently in the form of construction of cisterns. Whatever material is used, the same crude forms, of which we have specimens hundreds of years old, are still in vogue, and their numbers are largely increasing without let or hindrance, as houses are multiplied.

I was recently informed by a manufacturer that he was under contract to supply several hundreds of cisterns for the houses to be built on one metropolitan suburban building estate. These cisterns measure 3ft. 6in. by 3ft. 6in., and are 3ft. deep. They are simply open, square iron boxes; they are not provided with any protection against pollution. They are exactly like those made by our remote ancestors, and it is very suggestive of the filthy condition under which water is generally stored in such receptacles that it is found necessary to fix the outflow pipe an inch or two above the bottom, to prevent the grosser particles passing down and mingling with drinking water.

Such are the cisterns in ordinary use. They are not adapted for retaining water in a state of purity. They have no pretence to anything more than a certain capacity for storage, and they convey the fullest assurance that, under the most favourable conditions, the sediment of water and atmospheric deposits will accumulate and become a filthy compost in the bottom.

The Remedy.

What is then to be done? Are the resources of civilisation played out, and must the people drink water out of filthy cisterns for ever, as they have in the past; or, giving way to despair, reject storage cisterns altogether, and submit to all the dangers and annoyances incidental to accidental or other interruptions of the constant service? That is not so any longer, and the first note of departure from the old ways was sounded authoritatively in the report presented by Col. Ducat and the late Dr. Barry, in 1895, to the Local Government Board on the alleged failure of the East London Water Supply in the summer of 1895. In that report the commissioners said (page 16):—"Nothing could be further from our intention than to advocate any return to the old defective cisterns, with their movable wooden cover, but we do advocate the provision of properly designed cisterns. By a properly designed cistern we mean a cistern which shall be so constructed as to exclude alike the possibility of the entrance of dirt from the atmosphere, and the accumulation of any deposit from the water itself, whilst at the same time the water in the cistern is under the same pressure as the water in the main itself; in other words, the cistern that would satisfy us is merely a local enlargement of the water main. Such a cistern is in our opinion subject to none of the objections commonly urged against the use of cisterns. Under the best arrangements there must be times when periods of interruption of a constant service will occur, and at such times want of water for domestic purposes, for flushing water-closets, sealing water traps, &c., is calculated to lead to conditions injurious to health which should not be allowed to exist, and which a proper use of really efficient cisterns would guard against."

All honour to these gentlemen for their condemnation of cisterns as they are, and for their suggestion as to what a cistern should be; they have very clearly set out two conditions, without which it would be impossible to affect any real improvement in cisternage. First,

The Model Cistern

must exclude the possibility of the entrance of dirt from the atmosphere; and, second, it must prevent the accumulation of any deposit from the water itself. The accomplishment of these two conditions is a primary necessity, and has been found easy of attainment. A third condition, that the cistern must be under the same pressure as the water in the main, is also very easy of attainment; but if we remember the great pressure in some public mains, varying in the metropolis, as shown by General De Courcey Scott, water examiner, in his report for May, 1899, from a head of 510ft. by the Kent Waterworks to a head of 145ft. by the Chelsea Waterworks, we must conclude that a domestic cistern under anything approaching such pressure would probably be a dangerous hydraulic bomb, and that, to ensure any measure of safety, it would need to be made of very stout plate, be cylindrical in shape, and probably limited to small dimensions. These limitations are not at all necessary, as it has been demonstrated that a cistern of any size from 100 gallons to 1000 gallons can be fitted in such manner as to be enclosed, self-cleansing, and without pressure, and to be practictically what the Commissioners desired, viz., an enlargement of the main.

Breach of Contract: Technical Damages.—On October 3rd at Dundee, before Sheriff Campbell Smith, Peter Girrity, contractor, of Dundee, sought to obtain £10 from A. and T. Craig, builders and contractors, Dundee, for alleged breach of contract. Plaintiff stated that on May 30th he made a bargain with the defendant for excavating between 400 and 500 cubic yards in Hill Street, Dundee, for which he was to be paid at the rate of 1s. 7d. per yard. Defendant subsequently informed him that he did not want the contract to go on, and that he would do the work himself. Plaintiff assessed the loss he thus sustained at £10. Mr. T. Craig, the sole partner in the defending firm, said that he offered plaintiff 1s. 6d. a yard to do the excavation, and that before the bargain was completed he should come and see the ground. He appointed to meet plaintiff next morning on the ground. Within half an hour of their conversation, witness told plaintiff that he need not trouble to go to Hill Street next day, as he intended to do the work himself. He denied that any contract was entered into between them. The Sheriff held that technically in law there had been a breach of contract. There was no sign of any damage having been occasioned to the plaintiff. For a technical breach of contract there would be technical damages—7s. 6d., with 9s. expenses.

---

* A Paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

PHOTOGRAPHIC SURVEYING.

THIS was the title of a paper read by Mr. J. Bridges Lee, M.A., before a recent meeting of the Society of Engineers. In introducing his subject the author referred to the early history and literature of Phototopography, and to some of the most important surveys effected with the aid of photographs. He then enunciated the chief causes which had impeded the progress of metrophotography as applied to surveying in this and other countries. The author then proceeded to criticise and dispose of these hindrances which he showed no longer existed. He then set out in detail the special advantages of the photographic method. Amongst these advantages are: (1) A more complete and accurate record than can be obtained by any other means; (2) saving of time in the field; (3) ability to take full advantage of short, clear interludes in unsettled weather; (4) special advantages for military purposes in an enemy's country; (5) utility for travellers rapidly traversing a country; (6) usefulness for detecting geological and physiographical changes; (7) economy in operation.

The author then passed in review the various kinds of photo-topographic apparatus which had been designed and constructed, pointing out the distinctive features of most of the best known instruments. He stated that spherical projection had been proposed on account of its theoretical advantages, but he pointed out that it had never been brought into use in consequence of practical difficulties. Cylindrical projection had also been proposed and tried, with the result that while fairly satisfactory panoramic views had been obtained, cylindrical projection had not been found suitable in practice for serious survey work. He observed that all the best photographic survey work everywhere had been done with plane projection instruments. It was pointed out that the instruments used for photographic surveying might be exceedingly simple, consisting of nothing more than a good fixed focus box camera and lens, with levelling screws and levels, and marks inside the box to indicate the termination of the horizon and principal vertical lines.

The Canadian surveys, which the author said were among the best, had been effected by the aid of very simple instruments, supplemented by theodolites carried separately. On the other hand instruments might be very complex, like most of the continental forms, which were really photo-theodolites, the camera and theodolite being combined in one instrument. It was pointed out that nearly all photo-surveying instruments were designed to be used with the optic axis always horizontal, the Italian military instrument and Koppe's being exceptions to the general rule. The author then explained that until he introduced his improvements in photo-grametric apparatus all such instruments, without exception, whether simple or complex, yielded nothing but ordinary photographs, with marginal marks to indicate the terminations of the principal vertical and horizontal lines, which had to be ruled in afterwards by hand.

The author then proceeded to describe the improvements made by him, and which were designed to facilitate the subsequent interpretation of the photographs. These improvements consist of certain mechanical appliances inside the camera for securing an automatic record on the face of every picture taken of the horizon and principal vertical lines; of the compass bearing of the optic axis or principal plane; of a scale of horizontal angles applicable to all points visible in the picture; and of memoranda of useful information relating to the particular picture. The author then described the method of conducting a photographic survey, and of plotting maps from survey photographs.

AUSTRALIAN TIMBER EXPORTS.

ALTHOUGH Australia possesses several of the largest known areas of forest country, abounding with timbers of a most useful character, principally hard woods, the export trade in the same remains in an undeveloped condition, save in Western Australia, where considerable quantities of jarrah and other hardwoods are annually shipped to South Africa, Europe, and elsewhere. In New South Wales, notwithstanding the great natural resources of the colony, the value of the timber imported is greatly in excess of that exported, the bulk of this imported timber consisting of pines and other soft woods, the native pine being in some respects inferior to Oregon and Kauri, but there are other softwoods equal to any of the timbers imported. The imports during 1898 consisted of dressed timber valued at £65,567, rough timber estimated at £328,753, and sundries, such as doors, sashes, shooks, and staves, laths, shingles, and palings, worth £35,741. More than half of the dressed timber in 1897 came from Norway, a total of 8,723,450 sup. feet being altogether imported. The United States came second; while a large quantity was imported from Victoria, from South Australia, from Germany from New Zealand, from the United Kingdom, and from Canada. Of the rough logs, the United States stood first, with South Australia and New Zealand close behind. The bulk of the United States exports were from Port Eureka, California; and the Canadian, from Puget Sound. Australian hardwood trees are remarkable for the great size of the beams which may be obtained from them, as well as for the extreme strength and durability of their wood, the grey ironbark having a resistance to breaking equal to 17,900lb. per square inch, as compared with a mean of 11,800lb. for English oak, and 15,500lb. for teak. None of the other timbers of the colony have so high a resistance to breaking as this description of ironbark; but nearly all the varieties have a greater strength than oak. The absence of branches for the greater portion of the height enables the timber to be obtained to the best advantage; and as full-grown trees of most varieties are rarely less than 100ft. high, with corresponding girth, the quantity of timber obtainable is very large. It will readily be seen, therefore, that the timbers of the colony are in every way suitable for building construction, wood-blocking, jetties, railway carriages, and other work in which great strength and durability is required. The area of ironbark lands belonging to the Crown in New South Wales is about 16,870,000 acres, containing sufficient timber ready for cutting to yield 167½ million sleepers, and if private lands are also taken into account the number of ironbark sleepers alone which the colony can produce may be set down at 500 millions, sufficient for no less than a quarter of a million miles of railway track. Under proper forestry regulations and conservation the production of grey ironbark could be continued on a most extension scale for many years to come.

Armoured Doors Under Actual Fire.—A fire occurred a few weeks ago at the premises of Messrs. J. and G. Clayton, cotton manufacturers, of Whitefield, near Manchester. Between the shed where the fire broke out and the mill were two openings, cut off by Dowson, Taylor and Co.'s armoured fireproof doors. The shed was completely destroyed, with all its contents, but the armoured doors, in spite of the intense heat to which they were subjected, fully proved their fire-resisting qualities and prevented the fire from getting through to the mill. An examination of the door after the fire revealed the following facts:—The steel plates on the fire side were bulged out about 2in., and the first of the three layers of timber was carbonised. In all other respects the doors were as perfect as when put in, and had not buckled or twisted in the least.

Builders' Notes.

The Master Painters of England and Wales held their annual convention at Hereford on October 3rd, when Mr. Vaughan, of Hereford, delivered the presidential address. He said that the association was exceptionally strong in the north of England and the Midlands, but they would like more members in the east, west, and south of the country. Strikes he described as a brutal way of settling disputes, and he trusted that in future boards of conciliation would be the rule and not the exception. He quoted the two following sayings of Ruskin:—"All art worthy of the name is the energy neither of the human body alone, nor the human soul alone, but of both united, one guiding the other. Good craftsmanship and work of the fingers joined with good emotion and work of the heart." And "Life without industry is guilt, and industry without art is brutality."

Which is the back of a House?—This question recently came before the Hayward's Heath Petty Sessions in the case of the Hayward's Heath Urban Council *v.* Richard Broughton Briggs. Lemuel Backshall, surveyor to the Council, said the building known as "The Gables" was a residential house with stabling. The entrance faced east. The stable door and door of cottage faced south. The entrance to the stable yard was on the east side. There was no building on the north side. Defendant was building close to the boundary there, leaving no air space. By keeping the building 10ft. further south, air space could have been provided. The stabling was practically built. By the by-laws there should be 10ft. air space; practically there was not 10in. By Mr. Maynard (for the defence)—He defined "front" as the opposite side to the back. He called the south the front because the entrances were there. He should say "The Gables" fronted the east. The stable was parallel. There was no by-law preventing an entrance at the side. There was air space on every side except the north, and unless the south was fixed as the front the by-laws were complied with. A block plan should show to whom land on the boundaries belonged, but these plans did not. Without this being shown he thought the adjoining land belonged to the defendant. The plans were disapproved by the Committee on August 28th and by the Council on September 4th. By Mr. Prince (for the prosecution)—If the front was west there would be no air space at the back of the cottage because of the stables. If they faced east there would be no air space to the stables because of the cottage. Mr. Maynard called George Burstow, a Brighton surveyor, who prepared the plans of the coachhouse and stabling, and he considered the east to be the front, as the main entrance was on that side. Defendant's counsel said there was no definition of rear or front in the by-laws. He contended the front was that part first approached from the entrance or roadway. The entrance gates where primarily for the stable. The true rear of the premises was on the west. He contended that the Council had not the legal right to define the front of a building, which was to be defined by the superintending architect. He drew attention to the notice issued by the surveyor, stating that the air space must be at back or side. He did not contend that the notice could over-ride the by-laws, but was surprised such notices were not recognised by the Council after they were sent out. In delivering judgment the chairman said the question they had to decide was whether the defendant had infringed the by-laws or not. It was impossible for them to get away from the fact that the building, facing longways, going from east to west, had all the approaches to the house, stables, &c., on the south side, and they considered that to be the front of the building. Therefore the north side was the back of the building. The magistrates considered the by-laws had been infringed, and inflicted a fine of £1 and costs, or £3 17s. in all. Mr. Maynard gave notice of appeal to the Quarter Sessions.

Masters and Men.

The Bolton Tinplate Workers have struck work for an advance of 2s. per week.

The Building Trades of Aberfeldy, Dunkeld and Pitlochry. have resolved to form a local branch of the Scottish Building Trades Federation, to be called the "Atholl and Breadalbane Building Trades Association."

Carpenters' Strike at Birkenhead.—At Messrs. Laird's Works, Birkenhead, where 1000 horse stalls are being made for transport steamers to South Africa, the carpenters struck work on Monday, last week, owing to a dispute with the joiners, the complaint being that part of the work done by the joiners should be entrusted to the carpenters.

The Strike of Llanelly Copper Workers has been settled after a duration of ten weeks. The men struck work on account of the refusal of the management to reinstate one of the mill hands. During the strike the works were not entirely closed, a portion being kept going by the officials. The men have now returned to work, consenting to the employers' terms that the discharged workman should not be reinstated.

The Scottish Manufactured Iron Trade has improved recently. The Conciliation and Arbitration Board have been informed that the average realised net price at works have brought out £6 9s. 9.91d. per ton. The effect of this will be to create an increase of 2½ per cent. in the wages of the workmen, dated from 2nd October 1899, making a total increase of 17½ per cent. in the wages since the Conciliation Board was formed.

Newport Building Trade.—The letter of the Newport Building Industries Federation, offering to submit the question of labourers' wages to arbitration, provided the rule relating to working with non-unionists was withdrawn by the employers, was read before a general meeting of the Master Builders' Association. It was decided to refer the communication to the strike committee. It was reported that over 700 non-unionists were now being employed by the associated masters.

Nottingham Plasterers' Strike ended.—As the result of a conference between representatives of the National Association of Master Builders and of the National Association of Operative Plasterers, the plasterers of Nottingham, who had been on strike for a fortnight, have resumed work. The strike arose through an alleged infringement of the conditions discussed and arranged at the London Conference, following the general lock-out of plasterers throughout the country. The terms of the present settlement definitely set forth that certain kinds of work shall in future be only entrusted to plasterers.

The Hull Building Dispute.—A special meeting of the members of the Amalgamated Society of Carpenters and Joiners was held at the St. George's Hall, Story Street, last Wednesday, for the purpose of considering the proposals for the settlement of the existing dispute, which were submitted by the Hull Master Builders' Association at a conference with the operatives' delegates, and were reported in our last week's issue. The meeting was largely attended, and the proceedings, which were conducted *in camera*, were of a protracted character. Great exception was taken to the suggestion, as implied by the masters' proposals, that the present dispute should be referred to the Board of Conciliation. The men were firm on the point that they would only return to work on the understanding that the fact of their doing so put a complete end to the dispute in which they have now been engaged for practically six months. They, therefore, unanimously resolved to delete the words "both present and" from the second clause, and to make it read "and that any future difficulties shall be dealt with by such Board," instead of "and that any difficulties, both present and future," &c. Following the example of the joiners, the bricklayers and bricklayers' labourers of Hull have resolved to accept the master builders' terms of settlement on one condition, viz., that the words authorising the proposed Board of Conciliation to deal with the present dispute be deleted from clause 2 of the agreement. The position, therefore, so far as the operatives are concerned, is unchanged. They will not return to work unless the employers consent to end the dispute by reverting to the *status quo ante bellum*. Their determination not to work with imported non-unionists is as great as it was twenty-four weeks ago.

A Strike of Nail-Casters, raising an important principle, is in progress in Birmingham. The operatives object to a system which has hitherto prevailed in the trade of submitting groups of workmen to the oversight of foremen, the contention being that this leads to sweating. The operatives are employed on piecework, the pay being regulated by a scale agreed upon some time ago between themselves and the employers. Under the system of overseership a certain proportion of the earnings of each group is assigned to the foreman in charge, and this, the men contend, means that a considerable share of the money is intercepted and goes into the pockets of persons who do very little towards earning it. A vacancy having occurred among the foremen at Messrs. Healey and Peart's Works, in Vittoria Street, the men notified the employers that they would not consent to the appointment of a successor, being of opinion that the work could be equally well done under the general managerial eye, and that the proportion of earnings that had hitherto been paid to the foreman should be divided among the operatives. They did not demand the withdrawal of the other foremen employed by the firm, but indicated their intention to refuse to work under any newly-appointed foremen. The employers were unprepared to concede these terms, their contention being, it is understood, that the system of overseership is necessary to the efficient discharging of the work. In these circumstances all the casters and their assistants, to the number of forty, have come out on strike. The men are well organised, being members for the most part of the National Union of Gasworkers and General Labourers. Meanwhile Messrs. Healey and Peart are taking the opportunity of executing necessary repairs to their works.

Trade in Dundee—At the fortnightly meeting of the Dundee Trades Council, held last week—Mr. T. M'Burney, president, in the chair—an invitation was intimated from the Forfarshire and Perthshire Co-operative Conference Association to send delegates to the next meeting of the Association in Crieff. On the statement of Mr. Kirkaldy, of the Joiners' Union, that it was a waste of money, it was agreed by sixteen votes to thirteen not to be represented.—Mr. Joseph Downie stated that recently some Dundee lathers went to do a job in Inverness, and the plasterers there resenting their intrusion, came out on strike. He did not think that was fair, as the lathers formed a separate trade, and they had as much right to pursue their calling as had the plasterers. He suggested that the Trades Council of Inverness might be written to on the subject, and requested to use their influence.—Mr. M'Kenzie, a representative from the Plasterers' Labourers' Union, reported that the strike still continued, and had now lasted for eight weeks. He requested that the delegates should ask their respective societies to consider the action of the plasterers in accepting service from blackleg labour. Another delegate from the Society said the action of the plasterers was not consistent with Trades Unionism, and he asserted that service was being accepted from labourers who were provided by Græme Hunter. Mr. Douglas (Plasterers') said the Plasterers' Union had decided not to accept service from men sent by Græme Hunter, and that resolution still held good. The plasterers had no quarrel with their employers. He supposed the labourers would like the plasterers to strike on their behalf, but he was not prepared to make any statement on the subject. Several delegates condemned the action of the Plasterers' Union, and Mr. Kirkaldy said the plasterers were accepting labour from Græme Hunter's men, and they could not deny it. The plasterers in Dundee were thoroughly organised, and he believed the general feeling was that if they came out on strike they would lose their wages, and would get no benefit, because they had no dispute with their employers. The President thought the plasterers had made a mistake, and it was a pity that they had not carried out their original resolution not to accept service from men provided by Græme Hunter. He thought the plasterers ought to make some stand on behalf of the principles of Trades Unionism, and to assist the labourers in the present dispute. The subject then dropped.

Surveying and Sanitary Notes.

Yeovil Sewerage Scheme.—The Yeovil Town Council have adopted a sewage disposal scheme which the Surveyor estimates to cost £23,656.

Queen's Road Schools, Walthamstow, are being fitted with the patent tubular exhaust ventilators manufactured by John King, Limited, engineers, Liverpool.

Works of Private Street Improvements at Morecambe are proposed at a cost of £10,000, and a local government board inquiry was held by Col. Hepper recently into an application by the council for permission to borrow this sum and £500 for another steam roller.

Improvements at Cromer. — A local government board inquiry was held at Cromer on October 3rd into the application of the urban district council to borrow £3,000 for sewerage works, and £4,000 for the purchase of land on which to build council offices, a fire station, and public convenience.

Cousland's Ventilators.—Cousland's Improved Climax Patent Natural Exhaust Ventilators and direct-acting invisible roof ventilators are being used in connection with the additions now in progress at the Campbeltown Grammar School (Mr. H. E. Clifford, of Glasgow, architect). They were supplied by the Climax Ventilating and Heating Co., Ltd., 93, Hope Street, Glasgow.

Improvements at Harrogate. — On Tuesday last week Mr. W. A. Ducat held an inquiry in the council chamber, respecting an application by the Town Council to borrow £8,000, £4,000 being for additions to the Pump-room, £3,500 for street improvements in Bower Road, £300 for a covered shelter in the Valley Gardens, and £200 for a sanitary convenience on the Spa estate.

"House Building in Tropical Africa" is the title of an article in a new quarterly journal called "Climate," which is to be published shortly.

"Bleak House" for Sale. — Charles Dickens' favourite seaside residence, "Bleak House," Broadstairs, will shortly be offered for sale by public auction.

Sale of Timber, Stock, &c.—A sale of high-class builders' timber, stock, &c., will be conducted by Messrs. Joseph Hibbard and Sons, on Tuesday and Wednesday, October 17th and 18th, at 124, Shacklewell Lane, Dalston, London, N. We understand that the major portion of the timber is bone dry, having been stacked for about twelve years. The sale is due to the retirement from business of Messrs. W. Larter and Son, and is quite without reserve.

Engineering Notes.

New Brighton Pier is to be extended, at an estimated cost of £5,041.

A New Tramway at Huddersfield has just been constructed from Crosland Moor Bottom to Pinfold Well. The line is 1,170 yards in length.

The Leeds Tramway Scheme for adopting the electric overhead system for about seventeen miles of streets (referred to last week) was adopted at a meeting of the City Council on October 4th.

New Light Railway.—On October 3rd the Duke of Devonshire cut the first soil of the new light railway, projected by the North Staffordshire Railway Company, that is to run from Leebrook to Waterhouses. The capital required is £35,000.

Extensive Dock Scheme at Bristol.—The Bristol Dock Committee have decided to widen, deepen, and lengthen the present dock to enable the largest steamers to enter Portishead. This scheme is estimated to take two years to complete and to cost £350,000.

A New Pier at Southwold is now being constructed for the use of the "Belle" steamers by Messrs. A. Fasey and Son, of London. It will be of timber, 825ft. long and 30ft. wide, with a head 120ft. long and 30ft. wide. It is expected to be completed early next summer.

New Ironworks at Langloan. — The Langloan Ironworks, Coatbridge, formerly owned by Messrs. Robert Addie and Sons, after having been closed for a number of years, are to be restarted. The works have been purchased by Messrs. R. and J. Dempster, of Newton Heath, Manchester.

An Installation of Wireless Telegraphy has been established on one of the most dangerous parts of the Ushant coast between lighthouses thirty-five miles apart. The installation connects the Skiff Lighthouse on the Isle of Ushant with the new lighthouse constructed on the Ile Vierge.

The Death of Mr. John Knight, A.M.I.C.E., occurred at his residence Glen Cree, Silver Birches Road, Erdington, on Tuesday morning, last week. Mr. Knight was appointed last year engineer to the Birmingham Tame and Rea District Drainage Board. Since his summer holidays in the Isle of Man he had been suffering from what appeared to be a bad cold which culminated in pneumonia.

"The Father of Railways."—William James, the projector of the Liverpool and Manchester Railway, is (it is proposed) to have a statue erected to his memory in one of the principal railway stations of Liverpool or Manchester. It is stated that a recently discovered letter makes it quite clear that William James, and not George Stephenson, was the original projector of the railway.

Electric Lighting at Lewes.—On October 4th the Lewes Town Council adopted an agreement by which the town is to have electric light at a low rate from a good company, the ratepayers taking no risk. The company binds itself to spend £20,000, to commence laying the mains within six months, and to have the supply ready within two years from now.

Church Lighting. — Elie Free Church, Fifeshire, has just been lighted by gas incandescents supplied by the Sunlight Co., the chimneyless burner being used. These burners have white mantles when placed behind the people's backs, as in the transepts, but otherwise have a new kind of mantle called the "Acme," which is more pleasing for the eyes. Light for the pulpit itself is supplied by a cluster of burners in the corona suspended in the middle of the apse. To complete the effect, the burners have been supplied with Holophane globes, which so soften the light that the eye can detect no actual point of light.

Engineering Lectures.—The Council of the North of England Institute of Mining and Mechanical Engineers have, in collaboration with the Durham College of Science, arranged a course of engineering lectures to be delivered at the latter institution. They will extend over three winter sessions. Further information can be obtained from Mr. F. H. Pruen, Secretary, Durham College of Science, Newcastle-on-Tyne.

A New Railway.—The Bristol and South Wales Direct Railway is being rapidly pushed forward by the Great Western Railway Company. The object is to shorten and improve the route between Bristol and South Wales and London, which is done by avoiding the great curve to the south made by the present line through Bath and Chippenham. It will save eleven miles in the journey from Newport to London, while compared with the Gloucester route it is twenty-six miles shorter.

Society of Engineers.—The members and associates of the Society of Engineers recently visited the works of the Wicks Rotary Type-Casting Company, at Willesden Junction, N.W. By this machine a whole fount of type is produced by one wheel at every revolution. The segments that help to form the moulds are measured by a machine which is ten times as sensitive as a micrometer, and is so constructed that one portion only can be touched by the hand, as the heat from the hand is found sufficient to put it out of truth.

A Case about Water Certificates.—Henry Aylward, of Loxwood, was recently summoned at the instance of the Petworth Rural District Council for failing to obtain water certificates for four houses built at Loxwood. Mr. G. F. Suter, Inspector to the Council, gave evidence to the effect that the houses had been built and no certificate had been taken out. It was put forward for the defence that there were two wells to the houses, but Mr. Mant, for the prosecution, stated that the water had been examined, but was found to be unsatisfactory. If the defendant was willing to see that a proper water supply was put on, he should not press for a heavy penalty. The summons was dismissed on the payment of the costs of the application, there being a technical offence admitted, and defendant promising to make application for the certificate required, and also promising to put in a sufficient and suitable supply as required.

False Marks on Tramway Rails.—The Barrow Hermatite Steel Company were summoned at the Barrow Police Court on October 2nd under Section 1 of the Merchandise Marks Act, 1897, for putting false marks on certain tramway rails. The charge was that, in order to avoid certain testing provisions in connection with a contract for £33,000 worth of steel rails with the Sheffield Corporation, somebody had substituted for a piece of rail to be tested by the official inspector another piece, on which was the forged mark. On February 8th last, after a certain length of rail had been tested, and had withstood the drop test, two pieces were cut out by the inspector for the tensile test. Two days later the inspector attended to witness the testing, and found the pieces were not the same that he had cut off, and discovered that a false mark had been made by a forged stamp. The inspector pointed this out, secured pieces of the original rail, and though they were sufficiently good for the contract, they were inferior to the one with the forged mark. —Mr. Mellor, for the defence, said the Sheffield people got the quality of rails they had bargained for, and what had occurred was simply a technical offence under the Act. Nobody had been deceived in the slightest degree, and the company pleaded guilty because they had been unable to find out who marked the rails.—The company were fined 40s. in each case, and Court fees.

Trade and Craft.

LOW PRESSURE BOILERS.

The new catalogue of boilers for low pressure hot water and steam heating just issued by Messrs. Hartley and Sugden, Limited, Atlas Works, Halifax, contains, on page 3, a specially compiled table of boilers and cisterns for domestic hot water supply. The use of independent boilers has become so general, owing to the much more efficient and economical manner in which they do the work when compared with the ordinary range boilers, that such a sheet as that drawn up by Mr. F. Dye, C.E., M.R.I. (author of "Hood on Warming Buildings, &c."), is of great use to heating engineers and architects. The sheet indicates the sizes of boilers, cylinders, or tanks, pipes from boiler to cylinder, and approximate quantity of water per house per hour with a moderate fire. It also gives the relative value of 2in., 3in., and 4in. pipes, and the length of 4in. pipe required to warm various buildings. The book contains illustrations of a large number of very fine boilers, together with various particulars concerning them. The firm strongly recommend their wrought-welded independent dome-top boiler, with waterway bottom, No. 3E pattern, for supplying hot water to baths, lavatories, etc. It is an adaptation of their 3D pattern, but the space between the fire door and feeder is made of cast iron, instead of the usual waterway, as it has been found in some districts that sediment is liable to collect very quickly in the waterway over the fire door, and unless often removed, permanently injures the boiler. All the boilers made by the firm are tested under heavy hydraulic pressure before leaving the works.

New Town Hall for Norwich.—The Norwich Town Council recently decided, at a special meeting, not to make any adaptation of the present offices, but to build a new Town Hall.

Carpenters' Company Scholarships.—The two scholarships offered by the Carpenters' Company in connection with the building construction classes at King's College, Strand, were competed for on the evening of September 27th. There were more candidates than in former years. The two successful students were Messrs. Francis Hartnoll and Frederick Jones.

Architectural Craftsmen's Society. — The opening meeting of the Glasgow and West of Scotland Architectural Craftsmen's Society will be held in room No. 4 at 204, George Street, Glasgow, on Friday, October 13th, at 8 p.m., when Professor Sexton, F.C.S., F.I.C., will deliver a lecture on "Mild Steel." The syllabus for the coming session is an interesting one.

Aberdeen University Buildings are to be extended, and Mr. A. Marshall Mackenzie, the architect, submitted a report on the subject to a meeting of the University Court recently. The cost of what is called the popular plan, with Greyfriars Church erected at Queen Street, he estimates at £45,000; the modified popular plan, with the church on the Parliamentary site, at £40,000; restoration scheme, £27,000; and south extension, with the rebuilding of Greyfriars' in front of Mitchell Tower, £32,000. The Court came to a finding that any one of the plans would afford sufficient accommodation for the present wants of the University, and agreed to submit plans and the architect's report to the Joint Committee of the University Court for their information. A meeting of the Joint Committee was fixed for that purpose.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDINGS—		
Oct. 13	Great Harwood, Lancs.—Masonry and Walls	District Council	R. Chippendale, Clerk, Great Harwood, Lancs.
,, 13	Guildford—Repair to Workhouse	Guardians	Peak and Lunn, 36, High-street, Guildford.
,, 13	Huddersfield—Generating Station, &c.	Corporation	Borough Engineer, 1, Peel-street, Huddersfield.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. George H. Paine, Architect and Surveyor, 6, Stoke Newington-road, N. 2

In the City of London.

Most important BUILDING SITE, situate on the east side of Finsbury-pavement, nearly opposite Moorgate-street Station and the Station now being erected on the City and South London Electric Railway. The site is covered with the houses numbered 42, 44, 46, 48, 50, and 52, Finsbury-pavement, and 1A and 2, South-place.

The site has a frontage of 166ft. to Finsbury-pavement, another frontage to South-place of 109ft., and it is bounded in the rear or east side by a paved yard, to which it has frontage and cart access. The superficial area is 16,750ft., and the entire site can be utilised, as it is exceptionally free from rights of light appertaining to adjacent properties, and it is admirably suited either for shops with offices over, or for banks, insurance offices, or public companies.

The above will be LET by AUCTION by

DANIEL WATNEY and SONS, by direction of the Fishmongers' Company, Governors of Holt School, and with the approval of the Charity Commissioners, at the Mart, Tokenhouse-yard, E.C., on THURSDAY, NOVEMBER 2nd, 1899, at TWO o'clock precisely.

Particulars, with plan and conditions of letting, may be had either of Mr. J. Wrench Towse, Fishmongers' Hall, London Bridge; Mr. C. O. Humphreys, Giltspur-chambers, Holborn-viaduct; Mr. Howard Chatfeild Clarke, the Company's Surveyor, 63, Bishopsgate-street-within; and of the Auctioneers, Messrs. Daniel Watney and Sons, 33, Poultry, E.C. 1

SALE DAYS for the Year 1899.
Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Oct. 12
Thursday, Oct. 26
Thursday, Nov. 16
Thursday, Nov. 23
Thursday, Dec. 7
Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

WIMBLEDON HOUSE ESTATE COMPANY, LIMITED.

The Directors are prepared to receive PROPOSALS for the SALE or LETTING of SITES for Private Houses on this property, which is being developed by the Company as a high-class Residential Estate.

The land lies high with a deep gravel subsoil, and has a frontage of over half a mile to Wimbledon Common, and is well timbered.

The Estate, which until lately was the residence of the late Sir Henry Peek, is situated in the best part of this much sought after suburb, and commands extensive views over the Common to the Surrey Hills, and the excellent service of trains makes it peculiarly convenient to gentlemen whose pursuits command their presence in London.

Plans and further particulars may be had by applying to the Secretary, at the Estate Office, Parkside, Wimbledon, or to the Surveyor, George Hubbard, F.R.I.B.A., 85, Gresham-street, E.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—Middleton and Carden, 19, Craven-st., W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," "Malabar," New Eltham, S.E. 8

TRACINGS and Photo Copies made; Photo Papers supplied; work called for on receipt of post card.—G. Quinlan, 47, New-road, Wandsworth-road, S.W. 3

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

WORSHIPFUL COMPANY OF CARPENTERS.

LECTURES ON SANITARY BUILDING CONSTRUCTION

In connection with an Examination to be held at Carpenters' Hall on NOVEMBER 30th and DECEMBER 2nd, will be delivered as follows:—

Date, 1899.	Lecturer.	Subject and Synopsis.
		Site, Foundations, and Sanitary Requirements.
Thursday, Oct. 12th	Professor T. ROGER SMITH, F.R.I.B.A.	What is needed to make a Building a healthy one. Sanitary precautions as to Healthiness of Site and the sufficiency of Air Space about Buildings, Light, &c. Construction of Foundations, especially when the bottom is bad or under water.
Thursday, Oct. 19th	Professor HENRY ROBINSON, M. Inst. C.E.	Sanitary Arrangements of Buildings, the construction of Water Closets, Privies, and Dry Closets, Water Supply, Water Tanks and Services, and Plumbers' Work. The Essentials and Details of Good Drainage; the various kinds of Pipes, Pipe Laying; Ventilation of Drains and Testing of Drains; Dealing with old Drains.
		Sanitary Construction, Warming, and Ventilation.
Thursday, Oct. 26th	THOMAS BLASHILL, Esq., F.R.I.B.A.	The Properties and Qualities of Building Materials and modes of using them. Timber: its decay and preservation.
Thursday, Nov. 2nd	KEITH D. YOUNG, Esq., F.R.I.B.A.	Principles of Ventilating and Warming Buildings.
		Setting Out Work and Bye-Laws.
Thursday, Nov. 16th	JAMES BARTLETT, Esq., M.S.A., Demonstrator, King's College.	Principles of Calculating Areas, Cubic space; Interpretation of Drawings to Scale; Methods of Setting out Work, Checking Levels. Knowledge of the Acts of Parliament relating to Buildings. The Model Bye-laws issued by the Local Government Board, so far as they relate to the subjects of the Examination.

These Lectures are primarily intended for Candidates for the present or future Examinations, and are Illustrated by Take-to-pieces Models, large Diagrams, Photographs, and Specimens of Materials.

Lectures commence at 7.30 p.m.

Entry Forms for the Examination, Tickets for the Lectures, and all particulars can be had from
S. W. PRESTON, Esq.,
Carpenters' Hall, London Wall.

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
John B. Thorp, 98, Gray's Inn-road, W.C. 1

TO BUILDERS and CONTRACTORS.—On SALE Cheap, Slates and Slabs, Plain and Enamelled Chimney-pieces, and all other Slate Materials.—For Prices apply to J. H. Jones, Bryncrug Quarry, Towyn, Merionethshire. 3

APPOINTMENTS VACANT.

TO IMPROVERS.—An A.R.I.B.A. by Examination, residing in South London, is willing to BOARD and DIRECT the EVENING STUDIES of an ARCHITECTURAL STUDENT proposing to sit for the Exams.; must be engaged during the day; facilities for study (including use of most of the books required) afforded.—Apply, Box 1189, "Builders' Journal" Office. 1

PARTNER REQUIRED with £500 to £1,000 CAPITAL in well established Builders' and Decorators', and Estate Agents' Businesses. Good returns; first-class premises facing station, main road in fashionable south-west district of London. Every investigation courted.—Principals only apply "H. L.," Box 1201, "Builders' Journal" Office. 1

APPOINTMENTS WANTED.

ARCHITECT'S ASSISTANT requires EMPLOYMENT; seven years' experience, fifteen months with last employer; Good references; Knowledge of Civil Engineering, Land Surveying, &c.—Box 1205, Builders' Journal Office. 1

POINTING AND BRICKWORK WANTED (piecework); Good references given; "E. A." 98, Churchhill-road, Willesden Green, N.W. 1

YOUNG ARCHITECT, A.R.I.B.A.,
ASSISTS in the
PREPARATION of DRAWINGS, TRACINGS, &c.,
at his own Office.

WORKMANSHIP.

GENERALLY.

24. Proportions. Proper boxes or measures must be provided for accurately measuring the proportions of the various materials for the concrete. Such proportions to be ascertained by actual measurement at each mixing.

25. Mixing. The materials for the concrete are to be mixed by first filling a cubic yard or other suitable measure with the aggregate, then adding the cement (which must be separately measured). The whole to be twice turned over dry, then shovelled into a third heap, at the same time adding from the rose of a watering-pot sufficient water only to make the ingredients cling together. The materials to be again turned over in a wet condition before being removed and deposited in position. All necessary precautions must be taken to prevent the cement being blown away during the mixing.

26. Porous materials to be wetted. The whole of the coke breeze, broken brick, stone, or other porous aggregate to be well wetted with water before mixing, turned over, and allowed to drain, so that the surfaces may be damp, but not wet, when required for use.

27. Concrete to be freshly made. The concrete is to be mixed in convenient quantities to suit the requirements of the work. The chopping up and use of concrete or cement which has begun to set will not be permitted.

28. Levelling. All concrete when deposited in position is to be carefully levelled or laid to falls as may be required, and brought to an even and finished state.

29. Setting. Every care must be taken not to disturb the concrete whilst setting. In all cases where it is found absolutely necessary to pass over newly formed concrete, planks are to be carefully laid down.

30. Work prohibited during frosty weather. No concrete work shall be executed during frosty weather, nor even if there shall be any probability of a frost occurring before the concrete has had sufficient time to set.

FOUNDATIONS.

31. Concrete in Trenches. The concrete to be lowered into the trenches and not thrown in. After the concrete has been deposited in position it is to be well worked against the sides of the trenches by means of a spade or trowel, lightly rammed with wooden beaters, properly levelled, and brought to an even surface.

32. Building on Concrete. An interval of seven days (or such other period as may be directed) is to elapse between the completion of the concrete foundations and the commencement of any building upon them.

UNDER BOARDED FLOORS.

33. Laying. The concrete to be 6in. in thickness, lightly rammed with wooden beaters until the moisture rises to the surface, floated to a smooth and even face and finished to proper falls or levels.

UNDER TILE OR OTHER PAVEMENTS.

See Clause 33.

PAVING.

34. Laying. The concrete paving to be 6in. in thickness, finished with a granite surface, and smoothly floated to proper falls or levels.

35. Granite Surface. The surface of the concrete paving to be formed with a layer of granite concrete 1in. in thickness, lightly rammed with wooden beaters and floated to a perfectly smooth and even face. The entire thickness of the paving to be laid and finished in one operation.

36. Expansion Boards. Provide and fix expansion boards or slips at intervals of every 12ft., including removing same at completion, filling up the cavity with concrete and making good the surface.

37. Watering Surfaces. The finished surface of the concrete to be kept damp for at least seven days (or fourteen days) after being laid, by covering with wet sand or sawdust. The sand or sawdust to be kept moist during the period named by frequently sprinkling it with water from the rose of a watering-pot.

38. Protection. The concrete surfaces to be properly protected from any injury that might be caused by passing traffic, falling materials, etc.

39. Freedom from Discolouration. The surface of the concrete paving to be of uniform colour throughout, and free from any stain, discolouration, or other defect.

40. Surface Channels. Surface channels, having a shallow curved section, to be formed in the concrete paving where shown on the drawings. To be laid to proper falls, and neatly dished round the top of each gully

UPPER FLOORS.

41. Laying. The concrete to be hoisted to the required height, and carefully filled in between the rolled steel (or iron) joists to a depth of 9in. (or other specified thickness), lightly rammed with wooden beaters, and levelled and floated to an even surface. Each concrete floor is to be laid and completed at one operation, the necessary arrangements being previously made for carrying on the work without cessation.

42. Watering Surfaces. *See* Clause 37.

43. Sheeting. Provide and fix proper deal rough (or wrought) flat sheeting, with flush joints, including all necessary supports and strutting that may be required, and remove at completion.

43a. Alternative Clause. Provide and fix proper deal rough (or wrought) sheeting on proper centres or turning pieces, and of the curvature shown on the drawings. To include all necessary supports and strutting that may be required, and remove at completion.

44. Removal of Sheeting. The sheeting, &c., is not to be disturbed for a period of at least fourteen days after the concrete has been laid (or such other period as may be considered necessary), and it shall not be removed without first obtaining the sanction of the architect (or engineer) in writing.

45. Sheeting to be Wetted. The upper surface of the sheeting to be well wetted from the rose of a watering-pot before depositing the concrete upon it.

WALLS, PARTITIONS, STANCHIONS, Etc.

46. Depositing. The concrete to be carefully deposited in position, and lightly rammed between the casing and around the iron or other cores as shown on the detail drawings.

47. Girders and Stanchions. All projecting girders and stanchions to be similarly encased with concrete where required.

48. Casings. Provide and fix proper deal casings with flush points, including all necessary timbering and strutting, and remove at completion.

48a. Moulds. Provide and fix proper moulds to all bull-nosed angles, reveals for door frames, chases, and recesses where shown on detail drawings, and remove at completion.

49. Removal of casings. The casings and moulds shall not be removed until the concrete has thoroughly set.

LINTELS.

50. Moulded Work. The concrete for lintels to be filled into properly constructed moulds or boxes and well worked around the iron or other cores as shown on the detail drawings. The lintels to be made 18in. longer than the opening over which they are to be fixed, so that they may rest 9in. on the wall at each end. To be 9in. in depth for all spans not exceeding 4ft., and 12in. in depth for all spans exceeding 4ft. and not exceeding 6ft.

51. Cores to be Embedded. All lintels having a bed or width not exceeding 9in. to have a core consisting of a 3in. × 3in. rolled steel (or iron) joist weighing 10lb. per foot run properly embedded in the same. An additional joist to be added for every additional 9in. in width or bed of lintel.

52. Seasoning. The concrete lintels to be left in the moulds until properly set, and to be made at least six weeks before being required for building into position.

53. Moulds. Provide all necessary moulds, casings, and patterns that may be required for the proper construction of the concrete lintels as shown on the detail drawings.

BRICKS.

54. Fixing Blocks. Breeze bricks to be built into the walls where shown on drawings or otherwise directed for the proper fixing of joinery, etc. The concrete to be filled into suitable moulds and allowed sufficient time to set and harden before being used.

SEA AND RETAINING WALLS.

55. Concrete to be carried up uniformly. The concrete to be carried up uniformly over the whole area embraced in each section under construction, no part to be more than 3ft. higher than another. To be laid in horizontal courses not exceeding 18in. deep.

OVER 3000 MODEL SPECIFICATION CLAUSES.

Supplement to the Builders' Journal and Architectural Record, *October 11th*, 1899.

REASONS

Why you should purchase the 4th Number of Specification.	***Why you should not purchase the 4th Number of Specification.***
1.—It is the only book that covers the wide field of Modern Constructional Work.	
2.—It contains 3,000 Specification Clauses, Builders' Prices, Building Act Regulations, a Directory, Articles on Planning and Designing, over 20,000 Experience Notes, with an Index to the whole.	
3.—It is always ready for reference. If you wish to decide the best way to design a piece of work, the notes in Forty-four Sections are ready to assist you. In writing your Specification, Model Clauses are provided to save you time and thought. In the Building Act Clauses you will find all the regulations affecting your design, and with the help of the Prices you can easily get out your estimate.	
4.—It is not the work of one man. Over 120 Skilled and Expert Contributors have assisted in its Compilation, contributing to those Trade Sections in which their expert knowledge is admitted. Accuracy and authoritativeness are thus gained, and the risk of errors of judgment or prejudice, which might be possible in one man's work, are avoided.	
5.—In addition to its comprehensiveness, authority, and accuracy, it has the additional advantage of being the most inexpensive work of reference offered to the public. At the published price of **5/-** it is "A Marvel of Cheapness."	
6.—It will save you hundreds of hours in your professional or business capacity.

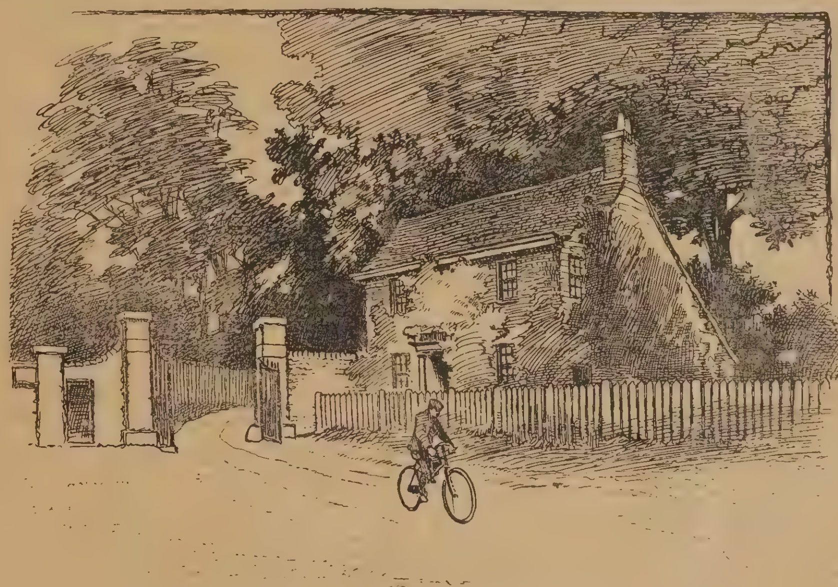
An Architectural Causerie.

Changes in Richmond Park. Many changes have taken place in Richmond Park during the last few years. Once a comparative solitude within hail of town, the suburbs have crept up to its borders, and with their advent has come a vastly increased public use of these fine stretches of bracken and ancient woodlands. There used to be but few public and unrestricted entrances into Richmond Park, but the private and semi-private gates have one by one been fully opened to traffic in response to the memorials presented to the Ranger by local residents; and existing gates which have proved dangerously narrow for the increased and increasing traffic have been widened. Two years ago, the principal gate—that known from its neighbourhood to the famous Star and Garter Hotel on Richmond Hill as the "Star and Garter" Gate—was thus set back; and now Roehampton Gate is being reconstructed. Until a year ago, the narrow entrance to the Park at Roehampton from Priory and Clarence Lanes and Barnes was strictly reserved for the use of residents in those lanes, themselves secluded from public use by barriers across either end. A year ago, in response to a long-continued agitation, these lanes and the Gate itself were freely thrown open, and since that time this short route from Barnes to Richmond has developed a crowded stream of traffic which has proved the Gate to be altogether inadequate for these new requirements. At the same time, the picturesquely tree-shaded lodge beside it has shown signs of settling on its foundations, and will shortly be demolished. Meanwhile, a new red-brick lodge has been rising on the opposite side of the pathway, and is nearly completed, and the old Gate has just been torn down. Our illustration will help toward preserving a record of the place before it has utterly faded from recollection. The new Gate will be at least three times the width of the old, and, instead of brick piers, will have ornamental open ironwork, which will have the very great advantage of enabling drivers to obtain a view ahead on coming round the sharp curves in the lane leading to this spot.

C. G. H.



ROEHAMPTON GATE, RICHMOND PARK. DRAWN BY C. G. HARPER.

The Statues of London. To an artistic-minded person well acquainted with the streets of London, the statues in many of the better known thoroughfares must be cause for grave thought. There are many fine squares, parks, and arteries which are a credit not only to our own city, but would be so if they were in any other part of the world; but can the same be said of many of the memorials to the great dead and living? When the statues do not themselves err in the matter of good taste, their surroundings and the circumstances of their situation are such that they frequently excite ridicule rather than admiration. There is that latest statue of the Queen at the eastern end of the Victoria Embankment. This is a very good statue in its way, though Her Majesty looks a trifle wooden, both in attitude and expression. It would look well on a lawn of a country house or in a small park, but placed where it is it is totally obliterated, not only by the huge buildings on two sides, but by the noble riverside thoroughfare and Blackfriars Bridge, which itself possesses many pedestals still untenanted by the statuary for which they were originally intended. A similar remark applies, perhaps less forcibly, to the equestrian statue of the Prince Consort in Holborn Circus, where the Prince is shown saluting the City Temple, for St. Andrew's Church is hidden very effectually behind piles of business premises. With the huge trading emporiums that form the walls of the Circus, the diminutive statue, which recalls a Lowther Arcade soldier on his "tin gee-gee," is entirely out-of-keeping and lost. Again, there is the statue of Brunel on the Victoria Embankment, which has been placed as an ornament at the end of a ventilator for the District Railway, where, in the company of a couple of volutes, a heavy wall, and a seat, it gazes blankly on the passing traffic and the river. Of all the statues in London which have been spoilt by their surroundings, this is pre-eminent. To make this memorial to one of England's greatest engineers at all effective, the surrounding wall and accompanying volutes should be removed, or the statue taken down and re-erected elsewhere—say in one of the adjoining gardens.

Taking now another statue which has been in our midst for many years, that of Richard Cœur de Lion, in Palace Yard, Westminster. Though it is a good piece of sculpture it is most unfortunately placed, as much of its beauty is really lost through being too close to the walls of the palace of St. Stephen. In order that this statue might be truly appreciated it should be placed in the centre of the roadway, where it would have, on one side the grand old Abbey Church of St. Peter's, Henry the Seventh's Chapel, and St. Margaret's Church, and, on the other the House of Lords, with its noble Victoria Tower filling up the vista looking west. It would not be costly to remedy the defect, as the statue could be very easily moved into its new position. A similar state of affairs exists at Knightsbridge with regard to the statue of Lord Strathnairn, now that the new buildings at Albert Gate are assuming colossal proportions. The writer could never understand why, as a military memorial, it was not set up on the park side of Knightsbridge Barracks. The Griffin, that German stove ornament marking the site of old Temple Bar, is quite out of place in Fleet Street and the Strand, and ought to be speedily removed.

At the entrance to the Lady's Mile in Hyde Park there is a statue of Lord Byron, which, so far as the bronze figure is concerned, is satisfactory enough; but its stone base is too large and heavy, while the name "Byron" is cut in a style that is almost illegible. Besides these—and the list could be extended—there are many statues in the squares of London which, behind their encircling iron railings, look for all the world like prehistoric specimens preserved in decay. Many of these could well be removed to more appropriate sites and surroundings. In conclusion, the writer would suggest that a commission be appointed, say of seven members, made up of sculptors, painters, architects, a gardener, and, perhaps, a qualified layman, to take the matter in hand, and give the statues of the metropolis a thorough overhauling. This would be a beneficial reform, and one that is badly needed. W. N. B.

Our Older High Buildings.

ALTHOUGH the general adoption of Chicago architecture in the capital is a prospect which cannot be regarded without dismay, and even the individual "skyscraper," or an attempt in that direction, is at present a most disturbing element when introduced amidst old European surroundings, some increase in the altitude of buildings is inevitable if the present rapid increase of our urban population is continued. It may be well, then, to see if structures considerably loftier than the average elevation to which Londoners have been accustomed can be raised which shall be fairly satisfactory to the view. Two instances may be cited of moderately successful buildings erected so far back as the sixties. The first is the Charing Cross Hotel; here the graduation of storeys and the lightness of the roof produce a not unpleasant effect, whilst the station yard is virtually a forecourt, and is agreeably broken by the Gothic "Eleanor Cross," patriotically revived by the South Eastern Railway Company; the iron grille, too, which bounds the front and one side of the yard, is simple and dignified. We are living, however, in the last year but one of the century, and it may be doubted if we shall ever see another terminus approach treated in this generous fashion; the pressure upon urban space and the desire for dividends are too strong. Another building of the same period is even better, architecturally—this is the Cannon Street Hotel, which is simpler, and of firmer design. Again, a fairly good approach provided in the shape of an open yard.

We may conclude, then, that high buildings can be treated with some amount of success, though opposed to the traditional very moderate elevation of English civil and domestic buildings. In each case, however, this satisfactory effect has been obtained with the aid of a rather effective open square; but where shall we obtain such squares in the future? The next building attempted on this scale was the Langham Hotel, which is exceedingly common-place, not to say ugly; placed on a very fine site commanding two great streets it represents an opportunity thrown away. A few years later arose the most extraordinary monstrosity that London has ever seen; this was Queen Anne's Mansions—twelve storeys of yellow London bricks, broken by monotonous little windows all exactly alike; architecture there is none, and to look up at it from below is distressing. Still, the system of high building did not spread, and a good many years elapsed before a general and noticeable increase in the height of street architecture set in.

One of the streets which may be said to have set the fashion is Northumberland Avenue. Its buildings are of varied rank and merit, the largest being the worst; it is ill-proportioned, being too narrow for its height, and consequently wanting in light, and the endless windows of its vast hotels leave an impression like a nightmare. The site of the old palace of the Percys, with its long, rather low front and Jacobean gateway, is occupied by a monotonous bastion-shaped thing which roughly intrudes itself upon Trafalgar Square; it is useful, however, as a warning to the public that no improvements can be satisfactory, however lavish the expense involved, unless authorities combine to work in harmony and allow their plans to be restrained by a sense of proportion.

J. C. P.

On Reflection.

The Amateur in Architecture.

IT will be remembered that the Earl of Wemyss, who takes a keen and laudable interest in architecture and in artistic matters generally, made a strong effort, at the time when the plans for the new War Office were being considered, to induce the Government to adopt an existing design by Inigo Jones. As is well known, Inigo Jones prepared designs for a palace at Whitehall, of which the Banquetting Hall (now used as the United Services Museum) alone was built. The completion of the design would have produced a line of buildings with a remarkably imposing façade, and it is not surprising that Lord Wemyss and many others were captivated by the idea. It had, however, the fatal defect that it failed to take into the reckoning the practical needs of a Government office, and ignored the fact that Inigo Jones's plan was the plan of a palace, not of public offices. To Lord Wemyss, and many other amateur architects, it might seem a perfectly practicable proposal to take a design for a beautiful building and adapt it to any possible requirements; to say to the architect: "Here is your building, fit your offices into it somehow." The Government, however, were better advised than to adopt this topsy-turvy method of proceeding; they preferred the more rational method of stating the accommodation required, and letting the architect design as beautiful a building as he might which should contain that accommodation, and should also utilise the whole of the very awkward site (another consideration Lord Wemyss' scheme would overlook). And so, having failed to impress the Government, Lord Wemyss issues a pamphlet giving the history of the controversy, in order that "the public and posterity may be able to form a sound judgment on this most important matter, and apportion blame accordingly." We cannot answer for posterity, but we have little doubt what the verdict would be of any present day jury of intelligent men who should take the trouble to read through the memorial to the Government on the subject, Lord Salisbury's answer thereto, and the debate in the House of Lords on August 4th, all of which are set forth in Lord Wemyss' pamphlet. Lord Wemyss seems to think that the fact that 140 peers signed his memorial gives that document a weight and impressiveness which should carry all before it. For ourselves we cannot see what claim these 140 distinguished individuals have to set up as censors of architecture, and we doubt not that many of them after considering the pros. and cons. of the matter will regret that Lord Wemyss has called posterity to witness that they made themselves the advocates of an ill-considered and impossible scheme. So far from convincing us of the desirability of the Inigo Jones plan, the pamphlet in which Lord Wemyss has marshalled the facts of the controversy points in an exactly opposite direction.

Sculpture by the Mile.

MR. RUSKIN'S objection to anything in the least mechanical has, as everyone knows, had ardent support and vehement opposition; but we are afraid the latest news from Berlin will cause more groans from the Sage of Coniston. Herr Selke, "a German inventor," has patented a method for producing sculptures by the aid of photography. There appears to be a rage just now for pushing forward the inventions (often fallacious) of the foreigner. A Russian or German engineer is reported to have devised some apparatus that is to turn the world upside down; and the public devours the news, and says "how wonderful." But very often you hear no more of this colossal invention. What would the public think if the same announcement were made of a mechanic at Little Pudlington? No, that would be too unexciting and common-place. It's the foreigner who claims interest, for he is the mysterious power that dabbles with worlds and carries the magic loadstone. This new invention of Herr Selke's is a case in point. Whilst in no way wishing to disparage its merits, we really cannot see why it is so boomed by pressmen, and we believe that to the true artist and craftsman it will certainly not appeal very directly. Here is a brief description of the invention. At a short distance from the model there is an arch of electric lamps having faint blue glasses for softening the light. Rising over the model's head is a second arch of jointed photographic plates, a few inches wide, which are movable forwards by a mechanical appliance connected with the camera. By means of certain shadows that are thrown, an unbroken series of so-called "photographic cuts" of the model are obtained. These are enlarged on cardboard, each is cut out with a fine saw, and the silhouettes are built up one on top of the other until the figure is complete. A viscid stucco-like material is put over it and the mould is ready for slight finishing touches with the modelling tool. The correspondent who forwards the information says that the photo-sculptures he saw were excellent, and very much like the originals. This then is the invention. The explanation of part of it is rather vague, but scientific reports forwarded from abroad often possess this characteristic. It is quite admissible to surmise that the cost of producing a sculpture by this method would be much less than by hand. Some builders would, perhaps, appreciate the new method, as it would enable them to add still more to their already greatly over-ornamented buildings. Sculpture is a fine art and a grand one, and it is thoroughly undesirable that it should in any way tend to become mechanical. We now possess a deal too many of those productions which Ruskin very aptly terms "furniture sculpture." One of our leading architects has described sculpture as the "very soul and voice of architecture," and we hope that should Herr Selke's invention ever become popular, it will confine itself to those limits where its presence may perhaps be defensible, and not intrude upon those where it is neither required nor desired.

Wanted—Pity and Funds.

THE Vicar of Castle Bytham, near Grantham, the Rev. H. Cotton-Smith, is in a terrible fix because of the state of his "neglected and dilapidated church." He knows what is wanted to be done, but this will cost £1,315, and he is faced with the oft-occurring difficulty of shortness of funds. The best way to explain the matter is to quote the vicar's own words:—"Our church is neither water-tight nor properly ventilated; the pews (falling to pieces) are impossible for kneeling; the walls are leprous; the chancel is a maze of benches; it is altogether uncomfortable, cold and cheerless, uninviting and inconvenient—not to mention the utterly neglected, cracked, unpointed walls, the absence of spouting, the decayed belfry, roof, and ceilings, and the general state of neglect *passim*." This list is, indeed, a pitiable one, but there appears to be no alternative but to effect a thorough restoration, or, what is perhaps better, to pull down the old church and build a new one.

MOSAIC.

II.—MATERIALS AND METHODS.

By GEORGE BRIDGE.

(*Continued from page* 116, *No. CCXLII.*)

THE materials most generally used for mosaic work are glass and marble—there are others obtainable, but they all have certain drawbacks. There is a composition which is made into small cubes by compressing coloured marble dust in iron moulds under great pressure. They can easily be distinguished from real marble, as their appearance is somewhat like sealing-wax; and when a cube is split the interior faces have a very similar appearance to the fractured surface of sealing-wax. Not only are these cubes objectionable because of the treacly appearance they give to finished work, but they cannot possibly be as durable as marble, nor can they produce the same workmanlike effect, because no moulded tessera can ever give the same distinguished appearance to mosaic as one that has evidently been cut by a workman and not turned out by machinery.

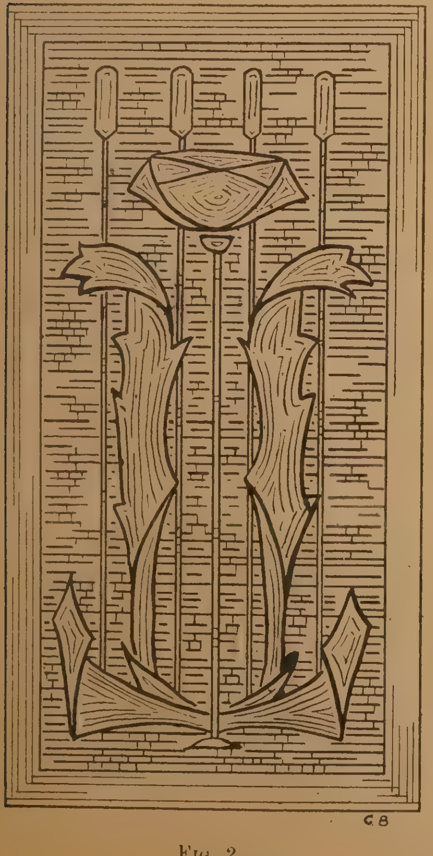

Fig. 2.

There are other machine-made forms used by some so-called mosaic workers, but as they are more of the nature of small tiles than of tesseræ they should really be classified as tiler's work. Pieces are cast or cut into hexagons, octagons, circles, squares, &c., being made of some ware that gives them the appearance of china, majolica, or ordinary pantiles. These have simply to be dropped into position to a geometrical design, and lack all the little irregularities so evident in mosaic and every craft requiring hand work. Another mechanical method of forming a so-called mosaic pavement is to float a layer of cement over a bed of concrete, and then to drop into the cement a number of chippings of various coloured marbles; when the whole is set the surface is rubbed down level with slabs of stone, but of course this is only a concrete pavement after all. These pavements are sometimes embellished with an ornament made by placing wooden templates in the cement, and, when the latter has set, removing the templates and filling in the spaces left with a marble concrete of another colour.

Both marble and glass are used for mosaic pavements, but marble is the material generally in favour. Although marble is not so lasting as glass it is less slippery in wet weather, and can be brought to a better surface; it is also cleaner in appearance, as the surface of the glass is slightly granular and very liable to scratch, and when once the dirt gets into the texture it is very difficult to eradicate, and, wet or dry, the pavement presents a permanently scored and spotty appearance. Of course, this only applies to glass for paving, and not that used for decorative work.

Glass is almost universally used for decorative work, as it is more durable than marble, and not so liable to be influenced by the chemical action generated by the atmosphere of some cities. By using glass a much wider field of colour is obtainable, and a greater variety of tints of each colour. Again, whereas marble when worn by time may present another tint or colour, glass, being made of one tint throughout, will remain unaltered. The glass employed for mosaic is made in ordinary glass-makers' pots or crucibles in kilns. The molten glass is ladled out upon slabs and pressed into a roundel of the required thickness—from ¼in. to ⅜in. The roundels should be kept to a uniform thickness, as, where tesseræ are used showing the cut edge, if the thickness of the roundels varies the lines of the tesseræ will be unequal. All glass for mosaic should be perfectly opaque. If the material is only semi-opaque, no matter how beautiful it may appear before being laid in the cement, once in position its transparency allows the dark cement to show through, and the most vivid yellows, blues, and greens become only very ordinary drabs.

The opaque glass is made of several textures; that is to say, when the roundel is broken the fractured edge will sometimes have a glassy and glittering appearance; sometimes a granular one, less glassy; sometimes a soapy appearance, with scarcely any glitter; and sometimes quite a dull one. Textures of all kinds are very useful in different parts of a mosaic, which should necessarily have the surface broken slightly by different textures in the materials. But when used singly in a work, a material that has a glittering edge reflects the light too much, and in consequence of the reflections only portions can be seen at a time, which makes the mosaic as difficult to decipher as a painting in a glazed frame. Flesh should be worked in a material that is as dull as it is possible to obtain it. Glass with a glittering edge is very useful in deep shadows of drapery—in places where, in a similar position in a picture, an artist would put a little varnish into his colour. But, of course, the proper use of the material requires experience, and the practical mosaic worker must use his judgment as to the positions in which he will place the various kinds of glass employed.

The roundels are cut up into pieces of almost equal length, this being a little more than the width. To cut the glass a machine is employed with top and bottom knives something like a small guillotine: the pieces can also be shaped by a pair of cutting pliers and American wheels (those used as substitutes for the ordinary glaziers' diamonds). The glass is not always used showing the cut edge. For very bold designs the material may be used in large flat pieces of irregular shapes to suit the flow of the lines of the design. When this method is adopted, glass is selected that has rich and varied effects upon the face of the roundel, and the required shapes are cut with an American wheel. A mosaic to be executed in this manner requires more than the ordinary rule-of-thumb knowledge of the imported Continental workman. It needs a keen sense and appreciation of colour, a thorough training as a draughtsman, and an acquaintance with the limits and rules of design. This will be understood when it is recognised that the shapes of the pieces of glass must be cut to help, and not to interfere, with the general design, and that the colour in the glass has to be much more intense than that shown in the design. If the individual colours were matched upon this, the finished mosaic would have a cold, bald, and washed-out appearance. This mode of working is very suitable for all work that is near the spectator, as if the joints are arranged properly the work is not liable to have the worried appearance that some artists produce when using the ordinary oblong tesseræ. This work is very effective in domestic decoration. Dadoes, wall fittings and friezes, fire backs and ingle nook panels, entrance halls, passages, corridors, bathrooms, and similar portions of public or private buildings, can be made beautiful in a permanent manner, the work being just as clean as, though infinitely more varied in colour effects than, that done with any other material.

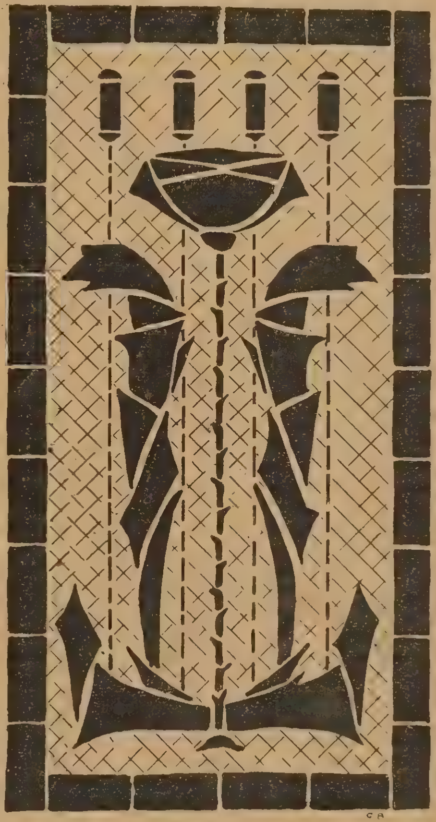

Fig. 3.

There is a bastard form of this mosaic used by some firms when cheapness is a consideration, but it is more the work of the tile painter than of the mosaic worker. Pieces of glass are cut to shapes suitable to the design, and the drapery, ornament, and flesh are painted upon them, and fired like painted tile-work, and then, like tile-work, the whole is cemented to the wall. This is not genuine mosaic, as in mosaic work there should not be the slightest question of its durability, and all effects should be obtained without the aid of painting, colouring, gilding, or any form of embellishment, and the worker should certainly have sufficient knowledge to obtain any effect by the use of tesseræ alone.

The worker may execute the mosaic either by sticking the tesseræ upon linen, paper, or strawboard, and then cementing it in place, or by spreading a putty-mastic over the surface and placing the tesseræ on it. The former method is used for mosaic pavements chiefly, as it gives a perfectly flat surface. There are some positions upon walls where it is best to have a perfectly smooth surface—in positions that are low enough to be touched by passers by; external walls also very often require a flat finish to prevent dirt and soot disfiguring the mosaic. The design must be traced and transferred so as to appear backwards upon the linen; it will then show its right face in the finished mosaic. The glass, whether on edge or laid in flat pieces, is stuck on the linen with gum, glue, or paste, and when the design is completed, if too large to be handled, it is cut up into convenient sizes for removal. The position to be occupied by mosaic—whether upon floor or wall—is cemented, and the sheets of mosaic are placed glass side towards the cement and well pressed in. The whole is then gone carefully over with a large flat piece of boxwood and a mallet, and hammered perfectly flat. The linen is then stripped from the face, and all the joints are carefully grouted up in cement and the places where joins occurred in the linen made good. Where a putty mastic is used a foot or two of the wall is spread with this substance about ¼in. thick, the design is pricked through a tracing into the mastic, and the glass, whether on edge or flat, is filled in to the design. If the work is to be finished flat, each superficial foot as it is completed is beaten with the wood and mallet.

When working large mosaics an inequality of surface is of very great service, as a broken surface gives a richness and texture to mosaic and removes the blemish so noticeable upon many large mosaics of having the appearance of monstrous oleographs. This appearance is evident in the restorations in St. Mark's, Venice; in the mosaics in St. Peter's, Rome; in the panels in the Albert Memorial, &c. The joints between the tesseræ play very important parts in large mosaics. The joint should be emphasised, and as much care should be taken to keep it equal as is shown in shaping each tessera. The joints should be at least half as wide as the tesseræ employed, and in some cases they can equal the width of the tesseræ—this is very requisite when gold is being used, as a good wide joint, while imparting a mosaic-like effect, gives to the whole work a softness, and also tends to grey and deepen colour. To masses of gold a wide joint gives more of an old gold sweetness, as distinct from the blatant, brassy finish of many gold backgrounds. This is a defect observable in the mosaics in the dome of St. Paul's Cathedral, where another blemish is very evident, and should be remembered by mosaic workers. These mosaics were executed upon linen, and afterwards stuck up in position, and the shapes of the slabs of linen employed are still observable. Where the joints between the pieces of linen occurred is permanently evident, the huge mosaics being scored vertically and horizontally like a great chessboard.

Referring to the illustrations, the ship panel (Fig. 1) shows mixed work by flat pieces with small tesseræ where necessary, while Figs. 2 and 3 show the same design executed in two ways, the former all of tesseræ and the latter of large flat pieces.

(To be continued.)

The Highest Church in Europe is the Sanctuary Chapel of the Madonna on Rocciamelone, Italy.

REGISTRATION OF ARCHITECTS.

AT THE A.A. DISCUSSION SECTION.

As our readers are aware The Builders' Journal and Architectural Record recently aroused great interest in the old controversy on the "Registration of Architects" by printing correspondence on the subject from many well-know members of the profession, and also by interviewing others. Partly, no doubt, as a result of this a discussion took place last Friday evening in the Architectural Association Discussion Section. The discussion, however, instead of breaking fresh ground, perhaps made the question more hazy and undecided than ever. The opinions that were elicited have all in the main already been expressed in our columns. Messrs. G. A. T. Middleton and A. R. Jemmett opened the discussion.

Mr. G. A. T. Middleton was in favour of the measure, which he contended involved the whole of the architects' position. At present anybody can pose before the public and practice as an architect. While admitting that the profession had many skilled and competent men, there were numerous unskilled men. Referring to the R.I.B.A. exams., he said a large proportion of those who did not go forward were allowed to practice as architects; this ought to be prevented. He wanted every architect to be properly qualified. This could only be done by Act of Parliament, by which all would be compelled to reach a certain standard or would not be allowed to earn their living as architects. According to the new Bill, all those practising as architects at the time of the passing of the measure would be enrolled as such in the first register, but no one would afterwards be allowed to enter the profession unless he were twenty-one years of age and were properly qualified.

The objection had been raised that by this system leading architects would be classed side by side in the first register with all the incompetent men now practising in the country. The effect would, in his opinion, be no worse than that produced by a Post Office directory and the list of architects in "Specification." Besides, it was not the old men but the young men who might expect to benefit by the Bill. The competition by which utterly incompetent men took the bread out of the mouths of young men was an unfair one, and ought not to be allowed. Some have objected that you cannot make an artist nor examine him in his art. He thought the R.I.B.A. could tell a very different tale. It was possible to tell whether a man could design or not, and to at least train an artist. The born artist was of little use if he remained untrained, as compared with what he might be if he were trained. On the whole, he thought the Bill was a good one, though some of the details of it might be challenged. It would effect a gradual leavening, it would do no immediate harm to anybody, and would be advantageous to the whole art world. It would not raise the status of architects, but the work produced would be generally improved.

Replying to Mr. Middleton's opening, Mr. A. R. Jemmett was of opinion that registration would unduly raise the professional side of architecture at the expense of the art side. Architects were artists, and should not be called professional men alone. There were numerous houses which were satisfactory as regards construction and utility; but they were not art. Such buildings could be erected equally well in an artistic manner. If artists were to be registered, why not register poets? He thought the guilds and societies exercised quite enough influence to keep the standard up. There was a great deal of difficulty in deciding what constituted an architect. If the Bill was passed, young men would strive to reach the stipulated standard, but would not soar above it, and the ideal of the architect would thus be damaged. Architecture was followed as a fine art of construction? Were those to be registered who were only constructors? If so, then the engineer would be the same as the architect. It was the architect and not the public who wanted to be protected. He was very much opposed to anything likely to make the profession the preserve of the sons of rich men. Generally speaking, this movement was due to dissatisfaction with the present state of the profession, and if carried out was likely to send out all artistic men. He thought the remedy lay in educating themselves and saying they did not know enough about architecture. The real question was whether it was a good thing for architecture as a fine art; if so, let them vote for it. The worse off an architect was in public repute the better architecture he often did.

Mr. Crawford Smith contended that architecture was a profession, and that construction was an important matter. He thought that the public would acknowledge the difference between the architect and the engineer. The fixing of twenty-one as the age at which one might be registered as an architect he considered too low: the standard should be raised to twenty-five years, as the majority of architects had not the necessary experience at twenty-one.

Mr. Maurice B. Adams was rather opposed to the movement, mainly on the grounds dealt with by Mr. Jemmett. It was not possible to examine a man in an artistic sense. He was inclined to side with those who thought how utterly inadequate registration would be. Registration would not altogether secure the public in the matter of construction. He thought that in the end the good architect would be able to compete successfully with the humbug, and that the public would be able to judge who was worthy of their confidence and commission.

If architecture was only a fine art, Mr. Ellis Marsland said he would agree with all that Mr. Jemmett had said. But it was not. It was also a science, and had a material side. There were only three professions—the Church, Law, and Medicine. Architecture was not one. Registration would stop incompetent men practising.

Mr. R. W. Carden was of opinion that the practical side of the question was a great deal more important than the artistic side, and he could not see why registering a man as being competent could injure him as an artist.

Mr. A. S. Taylor said that registration would be a big mistake. You might have a disqualifying examination, but it was impossible to examine a person as an artistic builder. Two great difficulties in registration would be, who would hold the examinations and who would set up the standard?

Mr. H. Munro Cantley thought that registration would not curb the artistic ability of the architect in any way.

When the public wanted an architect, said Mr. James Pearson, they only wanted a qualified man. If a man was registered it would be a guarantee to the public that he was competent.

Mr. Matthew Garbutt favoured the Bill, but said that if articles were insisted on it would shut out many clever but poor men.

Mr. C. H. Brodie said that you might prevent a man calling himself an architect, but you could not prevent him putting up buildings. On this ground he was opposed to registration.

Mr. George H. Smith said that if the Bill became law a local authority would not be allowed to employ an architect for public buildings unless he were qualified.

The chairman of the meeting thought that registration would do no harm to architects. It would not do any harm to the public. Broadly speaking, he thought that a Registration Bill would be a dead letter, for how were you going to prevent a man putting up a building without the supervision of a qualified architect?

Mr. Seth Smith's experience was that great movements had sprung from small beginnings, and had been at first very unpopular. This had been the case with the medical and dental professions. No Bill could prevent a man building, but this Bill would prevent him using the name of architect. As far as he knew, the Bill was not a matter of articles. He thought the status of the profession was an enormous thing. Great professions tended to make great men. The Registration Bill had greatly benefited the dental and medical professions. Unless a profession were really comprehensive the public would not take interest in it. The Bill would exclude incompetent men, a merit which would be especially appreciated by the provincial architect. He felt that it would raise the profession in art as well as in construction. It would be detrimental if the examination were only a practical one. Any capable artist could pass the examination that would be required. Votes of thanks were proposed and seconded, and the meeting then closed.

THE ARTS AND CRAFTS EXHIBITION.

THIS year's exhibition of the Arts and Crafts Society derives unusual interest from the fact that one gallery is entirely devoted to a collection of hitherto unexhibited works of the late William Morris. This collection includes tapestries and needlework from his designs, original working drawings for textiles and wall-papers, drawings made for the Kelmscott Press, and a most curious oil painting said to be the only one he ever executed. It is not necessary to attempt any detailed examination of this most interesting collection. The exhibition, to every admirer of Morris's work, would be well worth a visit if only to see this one gallery. Of the bulk of the contemporary work which makes up the rest of the display it is difficult to speak in general terms. It is varied and unequal. There is work which shows art, and work which shows craft; work which shows both, and work which shows neither. Perhaps the general impression that one brings away is that of a better exhibition than in previous years, less of the merely eccentric, more of the sober and restrained, less affectation, more sincerity.

It is a curious thing that the more successful works are generally those which more nearly approach to pure works of art, in which the craftsmanship is an entirely secondary and subordinate thing. We have in mind such works as the charming panels in coloured plaster, Nos. 104 and 105, by Anning Bell, the small panel in bronze, No. 112, by George Frampton, and the two small silvered panels by Goscombe John. The panel representative of music and dancing pleased us as much as anything in the room. In composition, drawing, colour and sentiment, it is delightful. If one must find some fault it would be that the left hand figure seems a trifle short, and that its arrangement, and its outline against the background, is hardly so fine as the rest of the panel. Another good work, of somewhat the same class, is a bronze panel in relief, for a fireplace, by Charles Beacon, No. 72, representing Orpheus and the beasts.

If we compare the different classes of exhibits we find a higher standard in the metal-work, jewellery, and blown glass than in the furniture. Nelson and Edith Dawson have a case of the most delightful work, in which the art and the craft seem fairly balanced; and in case G, West Gallery, are jewellery and necklaces by Miss May Morris and Miss Jane Morris, to which the same remarks apply. In the North Gallery, No. 256. are a forged iron and brass firegrate and a fender, by Nelson Dawson, which should be seen. They are vigorous and strong, and handled with knowledge and power. As a bit of real artistic craftsmanship they appeal to us as the best things of their kind. Close to this work stands a dresser, No. 142, by Sidney H. Barnsley, which one regards with mingled feelings. It is of plain oak, left its natural colour, and intentionally simple in design and workmanship; but somehow it does not altogether satisfy. When one comes to think about it, it becomes evident that much of the design is illogical. On plan the centre part projects with a segmental curve like a bow window, with a very heavy central support, into which the horizontal shelves, &c., are framed. This is surely not a convenient or characteristic form for a dresser, as it practically takes up as much room as if the whole piece of furniture projected as far as the centre part, and it makes the cupboards in the curved part too deep to be convenient for the bottles, jars, and other household effects for which such cupboards are generally used. This curved portion also has four doors on each side of the centre post, but only two cupboards where four are suggested. The upper part, corbelled out and arranged with shelves and hooks for hanging jugs, is very slight and insecure in construction. The top shelf has, at each end, a small cupboard with doors, which have very heavy raised panels. These raised panels are surely contrary to common sense, they are more characteristic of stonework, in cases where an appearance of weight is desired. Wood panels were invented to reduce the weight of a door, while keeping it sufficiently strong. They should do so in appearance as well as in reality. To treat them otherwise is to destroy their motive and *raison d'être*, and to use the wood in a manner that is not characteristic of the material. This design strikes us as being sincere, and as having a certain quaint air of rusticity about it which is very pleasing; that is why we regret that it does not show more judgment.

There are several articles of furniture, such as writing tables and cabinets, which appear to us to be more the outcome of affectation than of the needs of the case and the qualities of the material. Some of them have a more or less pleasing general effect, so long as we don't ask what they are and why they are made like that. Several have feet made of spherical wooden balls, which is about as bad a shape for the purpose as one could invent. They do not get a good firm grip on the floor, and the junction between the ball and the woodwork above must be weak, unless there is hidden metal—which would not be good construction. Why, again, is it necessary to bind a writing cabinet with broad bands of metal which incidentally form hinges? In mediæval times, when boxes had to stand more knocking about, and when property was less secure, but when, at the same time, there were no scientific burglars, it was all very well. Nowadays a burglar, who was a really skilled craftsman, would make short work of any metal-bound cabinet. These particular cabinets, however, do not seem to be designed with any special regard to safety; it is only that a piece of metal performing one function takes a form peculiar to another for no apparent reason, unless it is the repetition of an old form which in its day had its reason. There may be a better reason, but in artistic construction it should be at once apparent. The worst of such designs as No. 167, and others of the same type, is that they do give the enemy an occasion to blaspheme. "Take a packing case, stain it green, bind it round with hoop iron, put it on four legs, and tell us to come and admire it." This is the sort of remark one hears, and it is a pity.

A relief to this class of work is afforded by a simple and pleasing oak dresser, designed by Charles Spooner, which is perhaps one of the most satisfactory bits of furniture to be seen. Speaking, generally, however, the chairs seem better than the rest of the furniture. No. 203, a walnut chair by L. A. Turner, is pleasing in shape, and has forms which are suggested by the purpose which it serves. No. 253 is not so good, it is simpler but it looks stiff, and is nothing like so comfortable. There are a good many small chairs hidden away in corners in the central hall and north gallery which are more worthy of attention than many larger things more prominently placed.

In this central hall, also, are various chimney pieces in wood and iron, such as Nos. 409, 414, and 455. With the best wish in the world it is impossible to admire such designs; as specimens of workmanship they are good, but where does the art come in? The fact seems to be that the designers of most of the articles of utility, that need construction, forget that construction in itself is a fine art—perhaps the finest of all. A chair is made to be sat in and not to be looked at; it has to serve a certain purpose and is made of a certain material, its form is the outcome of these two circumstances. The art, or taste, or genius, is shown in creating a form which exactly expresses this purpose. The more nearly it approaches this the more original is the chair. If the result does not please us, we are in fault, not the chair, and the same thing is true of a cabinet or a fireplace. It is a question worth asking whether the average of workmanship shown in this furniture is superior, or even equal, to that done by first-class cabinet makers who have no pretensions to be artists. This is a point which we think should be always borne in mind. There seems a danger of the artist turning amateur craftsman, and if a piece of furniture is illogical in design and indifferent in workmanship, it is not to be saved by being stained green, or by being inlaid with a representation of a tree torn up by the roots.

It is impossible to point out in detail all the interesting and charming small objects which are to be seen; everyone should go to the exhibition and see them for himself. There are some blown glass by Harry Powell, altar crosses by H. Wilson and others, copper bowls and caskets, pewter plates, a lead sun-dial and rainwater head, pots and pans, fire-screens and coal scuttles, &c., &c. Of special interest to architects is a model of a small house to ¼in, scale by L. F. Crane. This is a nice design in rough cast and green slates, and by the way in which the ladies walk round it, and try to peep through the windows and down the chimney pots, and speculate as to what is inside, it is evident that this is a far better way of calling attention to one's work, in a legitimate manner, than is a drawing on the walls of the Academy.

The movement, which is represented to some extent by this exhibition, is one which is probably destined to have great influence over the art of the immediate future, and is, moreover, one with which we have great sympathy. But to have any permanent value it must be pursued on sane, healthy lines. Its success will depend on the number of sincere, hard-working men who think more of their work than of themselves, not on those who mistake fashion for principle, exalt novelty above originality, and think more of themselves than of their work. "Torn frocks," said Sidney Smith to the bad little girl, "are not in themselves a proof of genius." Neither are outraged conventions. Insanity may possibly be akin to genius—but why encourage and parade our disreputable relations?

A. R. J.

Mr. Towneley Green, a popular member of the Royal Institute of Painters in Water Colours, died on October 9th.

Royal Society of British Artists.—At a general assembly of this society on October 11th, the following were elected members: E. C. Officer, E. Leslie Badham, J. T. Dunning, Arthur Legge, and Harold Burke.

The Largest Scheme for Municipal Workmen's Dwellings yet inaugurated has just been adopted by the West Ham Town Council. On 100 acres of land, 3,000 houses are to be erected, at a cost of £1,000,000.

The Edinburgh Architectural Society held their annual business meeting in Dowell's Rooms last Wednesday evening, when the following officers were elected for the coming session:—President, Mr. Alfred Greig; vice-president, Mr. P. E. Nobbs; librarian, Mr. J. F. Matthews; joint secretaries, Messrs. A. Muir and C. B. Cownie; and treasurer, Mr. A. H. Lamont.

A Gladstone Memorial Tablet of marble and alabaster has been placed in Hawarden Church between the pulpit and Armenian window. At the head of the tablets are the words, "That rock was Christ." On one side are four verses of the hymn, "Rock of Ages," and on the opposite side the same verses in Latin, with an inscription stating that the hymn was translated by Mr Gladstone, and that the tablet has been placed by his grandchildren. The tablet was designed by Messrs. Douglas and Minshull, architects, of Chester, and executed by Mr. F. G. Sewell, Grosvenor Street, Chester.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

BY G. A. T. MIDDLETON AND R. W. CARDEN, ASSOCIATES R.I.B.A.

(Continued from page 135, No. CCXLIII.)

V.—CONSTRUCTION. (Part II.)

6. *A framed and glazed mahogany partition, 8ft. high, is required to divide a large office, the width being 24ft. A door is required at 6ft. from one end. Draw elevation to scale of $\frac{1}{2}$in. to 1ft., and horizontal section through door, half in lower and half in upper part, to a scale of $1\frac{1}{2}$in. to 1ft.* (See illustrations.)

7. *Give elevation and section of a French casement and fanlight for an opening 4ft. 6in. by 8ft. 6in. Scale $\frac{3}{4}$in. to 1ft.* (See illustrations.)

8. *Four rolled joists, 10 × $4\frac{1}{2}$ × 30lbs., meet on the head of a X stanchion, 9 × 9 × $1\frac{1}{4}$, which carries another stanchion above. Give a perspective view, or such other sketches as will accurately show the construction. Scale, say, one twelfth.*

A plate rests upon the head of the lower stanchion, and on this rests the rectangular cast box, to which the four joists are secured by angle irons. These joists are also secured to the plate, and the plate is bolted down on to the stanchion.

9. *Draw a diagram of the bending moments on a girder, 30ft. span, supported at the ends with a uniformly distributed load (sic.) of 15 tons, including weight of girder, and a concentrated load of 5 tons at 10ft. from one end. Scale $\frac{1}{8}$in. to 1ft., and 10ft. tons to 1in.*

(This question and the next were voluntary.)

Bending moment for distributed load :—

$$B.M. = \frac{w \times l}{8}$$
$$= \frac{15 \times 30}{8}$$
$$= 56\tfrac{1}{4}\text{ft. tons.}$$

Bending moment for fixed load :—

$$B.M. = 10\text{ft.} \times \tfrac{2}{3} \text{ of } 5 \text{ tons.}$$
$$= 10 \times 3\tfrac{1}{3}$$
$$= 33\tfrac{1}{3}\text{ft. tons.}$$

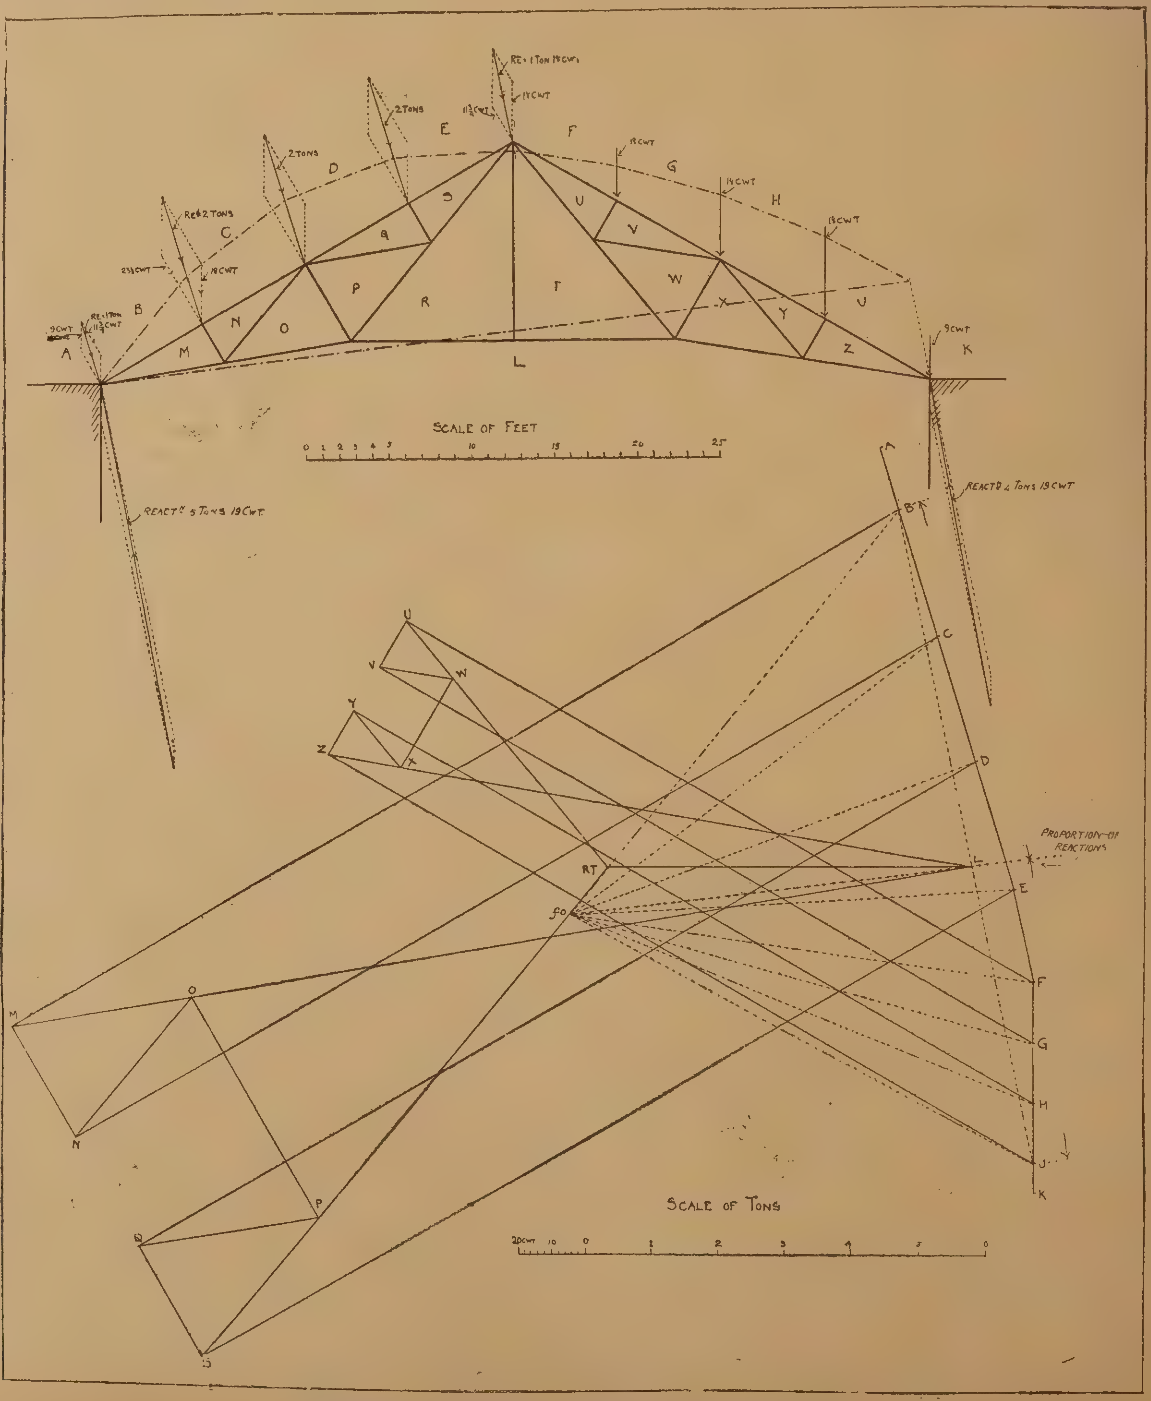
In the illustration, the firm straight-lined figure shows the B.M. for the fixed load. The fine-lined parabolic curve shows the B.M. for the distributed load, and the firm curved outline shows the ultimate B.M.

10. *Draw the frame diagram of an iron roof-truss suitable for a span of 50ft. and the corresponding stress diagram, assuming a vertical load of 28lbs. per ft. super., and the wind blowing on one side with a force of 30lbs. per ft. super. normal to the roof plane. Trusses 12ft. apart, scale 8ft. to 1in., and $\frac{1}{2}$in. to 1 ton.*

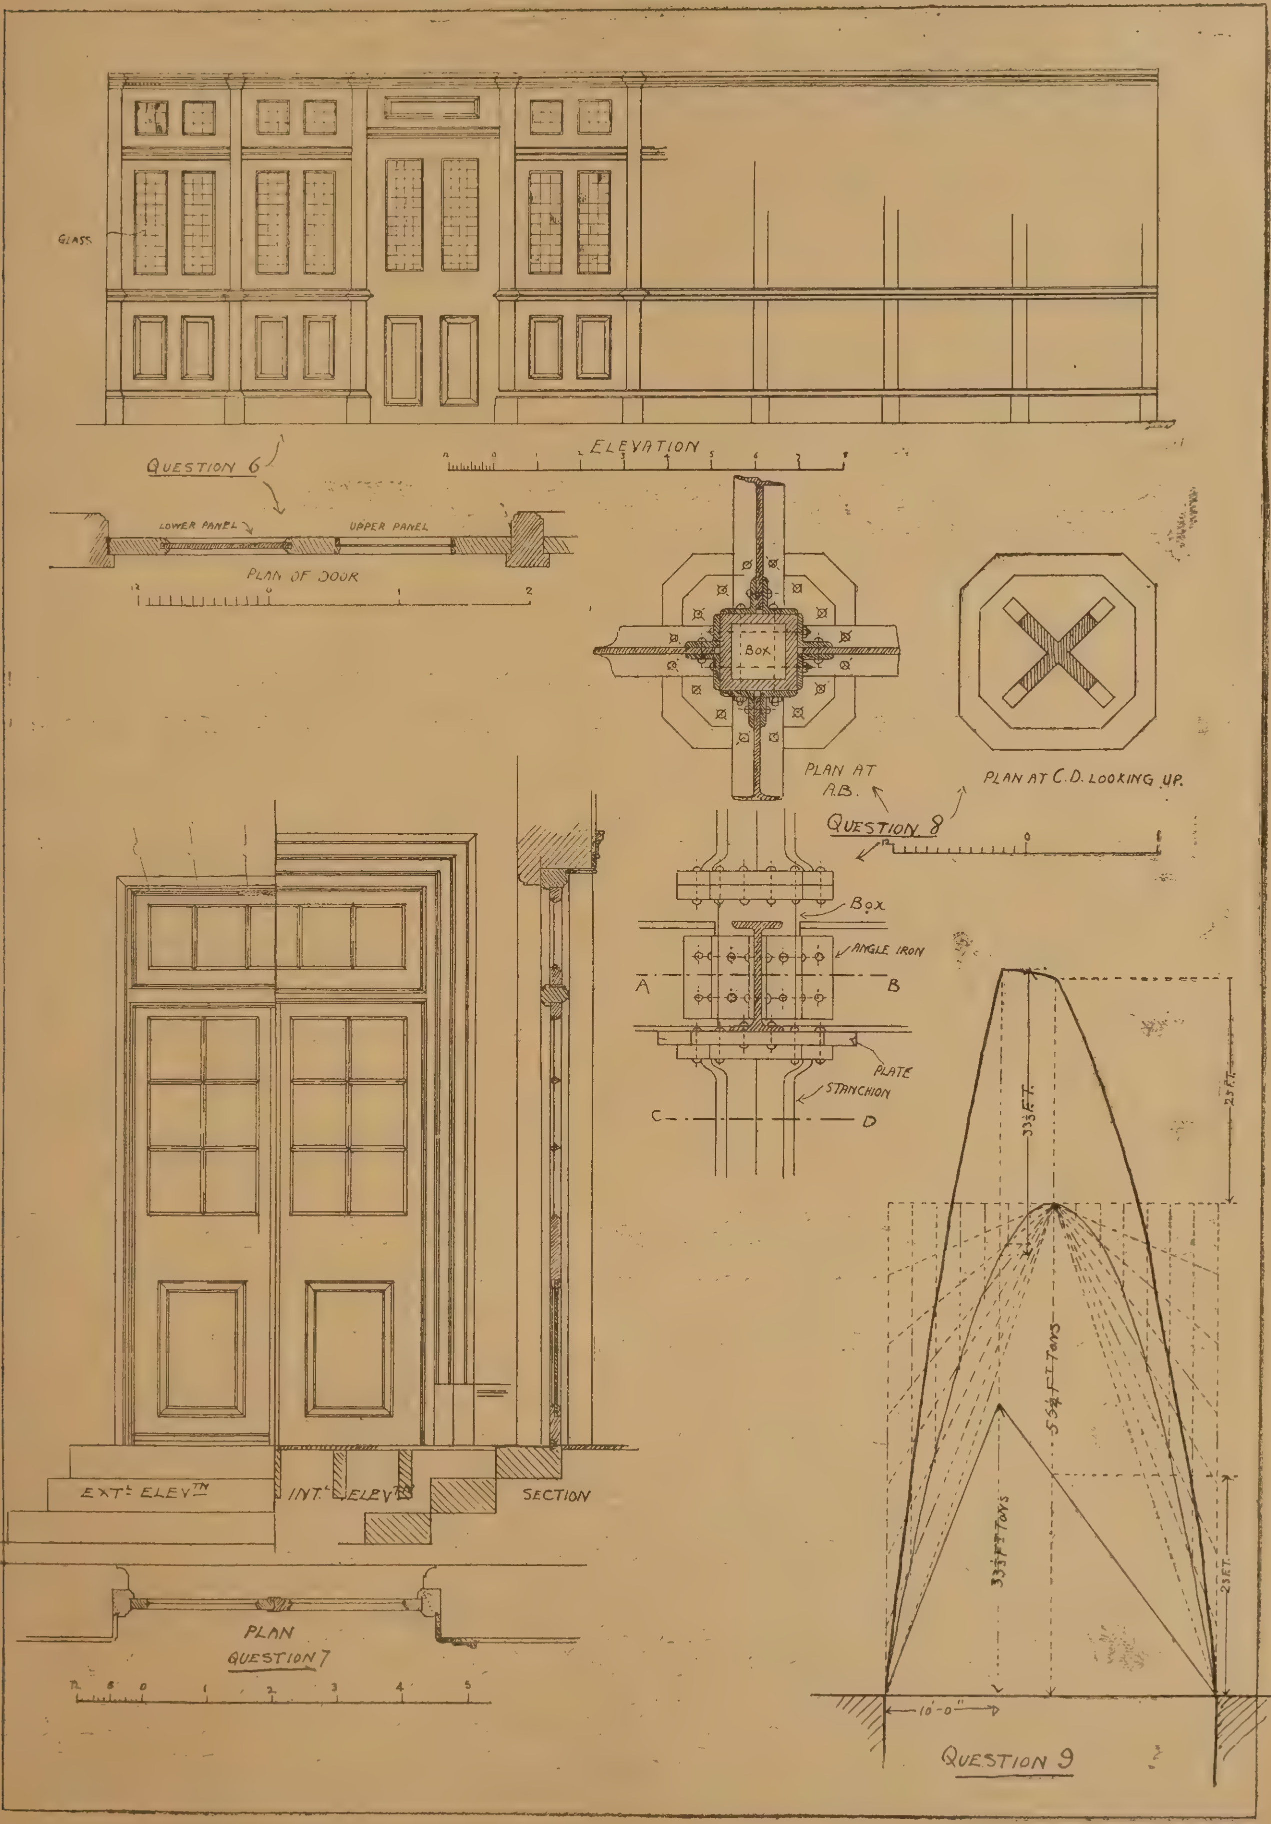
Dead load :—
50ft. × 12ft. × 28lbs.
= 16,800lbs.
= 2,100lbs. per "bearing" point (or about 18cwt.).

Wind pressure :—
29ft. × 12ft. × 30lbs.
= 10,440lbs.
= 2,610lbs. per point.

In the illustration, the dotted lines show the polar diagram, and the firm lines the stress diagrams.



ILLUSTRATING ANSWER TO EXAMINATION QUESTION 10.



ILLUSTRATING ANSWERS TO EXAMINATION QUESTIONS 6 TO 9.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

HOT-WATER APPARATUS.

To the Editor of THE BUILDERS' JOURNAL.

LONG EATON.

SIR,—The water of our town is very hard, and when used in hot-water apparatus is liable to seriously fur up the pipes when they are of iron. Would the use of copper pipes and cylinder obviate this in any way, and would there be any likelihood of galvanic action being set up if copper was used for the primary circulation pipes and cylinder, and galvanised iron pipes for the secondary circulation, &c.?—Yours sincerely, K. G.

Copper should not be used on account of the danger of verdigris. The Tubular Bath Boiler Co., Ltd., 184, Gray's Inn Road, E.C., make an apparatus which would probably suit your requirements.

LIGHT FROM SHOP WINDOW.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—I shall be extremely obliged if you will give the solution to the following problem: The window opening of a shop is 10ft. wide; which will admit the greater quantity of light, a square window 10ft. high, or a semicircular one, 6ft. to springing?—Yours truly,

GEOMETRICUS.

The square window, 10ft. by 10ft. would admit slightly more light. Square window: 10ft. × 10ft. = 100 square feet of opening. Semi-circular headed window: 10ft. × 6ft. = 60 square feet. Area of head: $\frac{\Lambda\gamma^2}{2}=\frac{22}{7}\times 5\times 5 \times \frac{1}{2}=39\frac{2}{7}$ square feet = total area, $99\frac{2}{7}$ square feet, or a difference of 102·85 square inches.

R. W. C.

WHAT IS A PARTY WALL?

To the Editor of THE BUILDERS' JOURNAL.

WESTON-SUPER-MARE.

DEAR SIR,—Kindly say if the wall marked A on the enclosed sketch (not reproduced) would be considered a party wall. It is about 5ft. high and encloses the garden of the adjoining owner. When building the stable (about twenty years ago) this wall was built up to the required height. The adjoining owner claims the wall as his, and says it is not a party wall. Please also say whether I can compel him to cut down the two trees which overhang my property, the falling leaves, &c., from which are a nuisance.—Yours, &c., A. C.

Whether the wall in question is a party wall or not depends on the ownership of the ground on which it is built. If the ground belongs entirely to either of the two adjoining owners it is not a party wall. If it belongs to them in common, or half in width belongs to one and half to the other, it is a party wall. In reply to the second question, the owner cannot be compelled to cut down the trees, but he can be compelled to cut the branches which overhang querist's ground, or querist can lop them off himself. H. P. B.

BOOKS ON LAND SURVEYING AND LEVELLING.

To the Editor of THE BUILDERS' JOURNAL.

LOUGHTON, ESSEX.

SIR,—Could you oblige me with the names of what you consider are the best books on land surveying and levelling.—Yours, &c.,

S. H. J. M.

The following are very suitable books:—"Practical Surveying," by George W. Usill, A.M.I.C.E., with four plates and upwards of 330 illustrations; crown 8vo, cloth, 6s. net. "The Theory and Practice of Surveying," by J. B. Johnson, illustrated by upwards of 150 engravings; 8vo, 17s. net. "Surveying," a practical treatise on the science of land and engineering surveying, levelling, estimating quantities, &c., with a general description of the several instruments required for surveying, levelling, plotting, &c., by H. S. Merrett, revised by G. W. Usill, A.M.I.C.E., forty-one plates, with illustrations and tables; royal 8vo, cloth, 10s. 6d. net. "Levelling and its General Application, by Thomas Holloway; 8vo, cloth, 4s. 2d. net. These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, London, W.C.

WATER UNDERNEATH HOUSE.

To the Editor of THE BUILDERS' JOURNAL.

HARLESDEN.

SIR,—Could you tell me the best way to get rid of water under a house. I think it must run down the footings of the party wall on the left-hand side, as whenever it rains water is found at the front door. I might mention that walls are already in for cellar, although this is not excavated. The drains have been tested and found sound.—Yours truly,

B. J. S.

According to the sketch accompanying the query (not reproduced), it would seem most probable that the drains were at the root of the trouble seeing that they run through or alongside the spot where the water collects; and, although the drains have been tested and found sound, one feels strongly inclined to advise that a further and more searching test be applied to them, particularly so for the reason that, according to available particulars, we can see no other possible cause for the water accumulating at the indicated spot. There seems to be no reason why the footings of the party wall should serve to draw the water, unless a rain-water pipe is allowed to discharge in close proximity thereto, or unless the ground or pavement falls towards instead of from the house. Before any remedy can be applied or suggested it will be necessary to have positive proof as to where the water comes from; and perhaps the best course to pursue would be to remove the flooring near the front door in readiness for a strict observation to be made during a sharp fall of rain.

H. E.

PREVENTING DISCOLOURATION OF PAINT.

To the Editor of THE BUILDERS' JOURNAL.

FALKIRK.

DEAR SIR,—Will you kindly let me know whether there is any oil or other material that, if applied to new cement work, will prevent the acid in the cement eating out the colour of the paint on the front of a house. I generally find with outside walls that are cemented and painted that where the cement has been newly rendered, or where patches occur, the colour always fades in a very short time. Any information as to the means of preventing this discoloration will much oblige.—Yours faithfully, A. G.

It is in all probability a free alkali present in newly rendered cement work, which is the cause of the corrosive action to which paint applied thereto is always more or less subject, and not an acid as is generally supposed; and as an alkali finds its antithesis in an acid, it is possible that the application of a weak solution of acetic acid (or ordinary vinegar), such as is frequently employed as a corrective, before painting interior plastering, may minimise the trouble; but care need be exercised that only sufficient acid is used to neutralise the alkali present, as an excess of one element is as deleterious to paint as the other. When it can be so arranged it is advantageous to leave new cement work unpainted for at least twelve months, after which interval no trouble is usually experienced. But as the front of a house is mentioned, and as it is not usual to paint a newly rendered front, it occurs to me that the question may have reference to new cement patches in old work, and although it may in the present instance be too late to effect any alteration in the work it may be instructive to note that patching should be executed with Roman cement, which allows paint to be applied to its surface without any preparations, and upon which it has no corrosive action. Presuming the work cannot be now undone, one of the following plans might be tried; but, although each is said to be effective, I cannot vouch for their efficacy: (1) Give the work a coat of Duresco as soon as the plastering is finished. (2) Apply a coat of petrifying liquid (Fluate or Lopissa solution are suggested) three or four days after repairing the work, and giving a second coat when the first is quite dry. (3) A simple coat of ordinary distemper. The only oil likely to be of service is boiled linseed oil, but we are much inclined to doubt its complete efficacy for the purpose. H. E.

TAKING OUT QUANTITIES FOR FACTORY CHIMNEY.

To the Editor of THE BUILDERS' JOURNAL.

MANCHESTER.

SIR,—Will you kindly state the method of taking out the quantities for brickwork in a factory chimney, octagonal on plan and about 150ft. high.—Yours truly, J. V. S.

Commence with excavation, measuring the length and breadth of the concrete and the depth to underside from ground level. If more than 6ft., keep each 6ft. separate, as —yds. cub. in excavation under 6ft. deep, —yds. cub. ditto under 12ft. deep. State proportion removed — runs, spread and levelled, or carted away, as case may be, and remainder as excavate, and throw out, re-dig and ram. Let the preamble contain a clause for pumping or bailing to keep the foundations free from water. If there are any soft places in the bottom they must be filled with dry brick rubbish and well rammed before the concrete goes in. Measure the whole surface of the sides of excavation for timbering, calling it —ft. sup., strutting and planking to sides of perpendicular excavation — ft. deep. Measure the concrete length, breadth, thickness, and state — yds. cub. Portland cement concrete as described; — yds. sup. spread and level Portland cement concrete to receive footings. In measuring the brick footings they must be averaged, but not in the same way as averaging the footings of a brick wall. Owing to the set off on all four sides the method of averaging, if square, will be as follows:—(*a*) [(breadth top course + breadth bottom course) ÷ 2]^2 × depth of footings. (*b*) (breadth top course squared + breadth bottom course squared) ÷ 2 × by depth footings. Then (*a*) + (b) ÷ 2 = ft. cub. Thus top course 12ft., bottom course 18ft., depth 4ft. 3in. $(a) = [(12 + 18) \div 2]^2 \times 4\frac{1}{4} = 956\frac{1}{4}$. $(b) = (12^2 + 18^2) \div 2 \times 4\frac{1}{4} = 994\frac{1}{2}$. $[(a) + (b)] \div 2 = 975\frac{3}{8}$ = 975ft. $4\frac{1}{2}$in. cub. The brickwork of the stack will be measured in portions as the shape or thickness changes. Measure first the size of a square to contain the part and multiply by the length. Then measure for deduction the wants at the angles and the flue. Bring the whole of the stock brickwork finally into one item reduced to yds. cub. and describe it as cube brickwork in mortar, to chimney stack measured net — ft. high. If over 60ft. high, the material above that height is sometimes billed separately for each 20ft. to allow of the price being modified to cover the extra cost of hoisting and scaffolding. See that the drawing is in accordance with the London County Council rules or local bye-laws, as regards thickness, batter, footings, projection of cap, &c. Measure for rough cutting to interior, and fair cutting to face for all skewbacks, measure gauged arches, relieving arches, string courses, dentil courses &c., as they occur. Facework and pointing, also up each angle of octagon for fair cut squint quoin. Leaning's Quantity Surveying (Spon, 15s.) should be followed for the mode of measuring details of brick and stonework, it would occupy too much space to recapitulate it all here. Provide centering for the arches, and for the flues also, unless they are covered with flat fire tiles. HENRY ADAMS.

In reply to NEW SUBSCRIBER, the first number of the present volume was No. 235., dated August 9th.

ARCHITECTURAL ASSOCIATION.

ANNUAL GENERAL MEETING.

(*Continued from page 147, No. CCXLIV.*)

PERHAPS the most useful addition made in connection with our social work is the new Common Room. I do not quite know whether to describe this little addition as a foretaste of better things to come, or as an apology for not yet getting something better. But this I can say; that the gentlemen of the committee, without in any way abating their individual and collective efforts to find suitable new premises, have fully realised the difficulty of so doing, and in taking and furnishing the new Common Room, have not only had the immediate comfort of the members in view, but also the business interests of the Association, as with the front room, the present premises have a commercial value which would render the disposal of the lease at short notice a comparatively easy matter. My most sincere wish when I last addressed you was that during my year of office I might be able to announce that new premises had been obtained, which would not only give ample

Accommodation

for our regular work in studio and class rooms, and for our social requirements, but would provide demonstration workshops for the craft side of our work. I will not weary you with again pressing my views on this subject, except to say that no stone shall be unturned and no time or energy stinted by myself during the present session in trying to satisfactorily solve the difficult question of new premises. I shall not, I think, be divulging Committee secrets when I hint that we have a large scheme at present under consideration, but I have had too many disappointments under this head to be over sanguine of success in the present instance. It is, I fear, too much to hope that it may fall to my lot to announce the good news that new and worthy premises have been found, but I sincerely trust that such an announcement may be made early in the new century.

The New Century.

What a strange influence these purely arbitrary divisions of time seem to have upon our minds, and even upon our actions—an influence that I cannot but think is for good in many ways. It may be from sentiment or from mere habit, or it may be from a sense of duty or discipline, but from whatever cause, the fact remains that there are a few who do not feel in some measure the influence of even a passing year—yet how indefinable and paradoxical is that thing we call time: the past is gone, the future has not come, and what we call present drifts into the past while we try to define it. Being what it is, however, the periods into which we divide it, marks, as it were, vantage points from which we can look backwards and study, as in a book, our successes and our failures. Gentlemen, this session of the Architectural Association is, as it were a bridge between the nineteenth and twentieth century, and as we draw near to the apex of that bridge or line that divides the two centuries, who is there amongst thoughtful men who will not tarry a moment to look back on the many wonders wrought during the last century—wonders in science that for better or for worse have transformed the face of the whole world; wonders in literature, poetry, and music, that have left the world much richer than they found it; wonders in art that will influence artists for centuries to come; wonders in architecture—yes, I think I am safe in saying even in architecture, if I add the words for better or for worse. But of this more hereafter. In all these wonders of the nineteenth century have we not infinite scope for reflection, study, and encouragement? Most strongly would I advise our students not to content themselves with only reading that which immediately concerns their own particular branch of art. If they would learn what real industry and perseverance means, and what it has accomplished, if they would know what little things have led to great results; in short, if they would learn the highway to success in life, let them, as a relaxation, read the interesting biographies of those who have brought about the wonders I speak of. The very word biography is, I fear, enough to frighten most of us, but I know of no more certain, and, in the end, more pleasant way of being helped forward in our life's career, than learning how others have gained success and lasting renown through their own perseverance and energies in the face of seemingly insuperable difficulties—and, above all, what have been the great motives and incentives that have guided them in their life and actions. But to return from the general view of progress in the nineteenth century to the more limited sphere of our own beloved art, what a strange and interesting page in the history of the century might be written thereon. The task of writing it will probably be undertaken by some enterprising author before long, and if carefully done, there should be ample material for an extremely useful and interesting volume, although the difficulty of following through the

Various Fashions and Heterogeneous Vagaries

of the last hundred years would, I fear, be great; but if episodes in the lives of the leading architects who have gone before, but left the stamp of their genius on many buildings, great and small, throughout the land, could be collected and incorporated, such a volume would, I feel sure, be much appreciated. The danger, of course, in reviewing the earlier work of the century is that we are too apt to judge work from our present standpoint. This danger becomes apparent even in ordinary conversation, as so few seem to be able to make allowance for the wholly different state of things existing, architecturally, in the earlier part of the century, and condemn those whose names in their day were looked up to by all. Are we, in these days, so sure of our own ground that we can afford to severely criticise a style of work that does not exactly coincide with our enlightened views of style? I am confident of one thing, that if we as a rule tried to find out the good points of a brother architect's work, instead of finding a kind of pleasure in picking out what we conceive to be the bad points, it would be better for ourselves, and

The Profession at Large.

In saying this, I do not for one moment wish that proper criticism should be curbed in any way. There is of course criticism, and criticism. For instance, a bad plan—misapplied ornament—palpable ignorance in detail, and bad proportion in building, poor construction or bad workmanship of any kind, &c., in which ca[illegible] severe criticism is most desirable, and even helpful, in that it makes one to remember what to avoid. But there are few buildings that one takes the trouble to visit that have not some good points in design or planning. Try then and find out those good points, and put away the bad ones as much as possible on the principle that "you never touch mud, but some sticks." There are numerous good points to study in the lives and works of the many able architects of the century. Architecture, as a great art, was in a measure dead in England at the commencement of the century. In what may be called the Stucco period, a bastard classic and Gothic style was the order of the day. What seemingly insuperable difficulties had to be faced by men who longed for a better state of things! What study, energy, patience, and enthusiasm were necessary to overcome the difficulties and prejudices existing! Who is there amongst us that will refuse to admire the pluck and perseverance of the early pioneers in the great cause of the raising of our art to its proper pedestal? Of course, with much of the work done in the early stages of the great architectural revival, we can have but little sympathy, but we can at least appreciate the motives that undoubtedly inspired men to aim at a higher ideal than was then prevalent. It would be hard to over-estimate the enormous influence that such books as Rickman's attempt to discriminate the styles of architecture in England, first published in 1817, together with the early publications of Parker, and followed by the writings of Sharpe, Paley, Pugin, and Brandon, have had upon the architectural history of the century. The earliest of these works prepared the ground for the great Gothic revival that followed in the forties, and following decades. We must remember, however, that this great revival was not brought about by architects only: it came like other great movements, in answer to needs and requirements of the times; it moved concurrently with the great religious revival that commenced at that period, it took firm root in the great seats of education, our universities, with the result that it influenced the minds of both clergy and laymen, who then took up the study of architecture with a thoroughness and zest that would shame many a student of the present day. Their heart was in the work, educated minds were stirred with a warm enthusiasm at the idea of the revival of what, in the truest sense, might be termed our national architecture. With such able men as Barry and Cockerell living,

The Best Traditions of Classical Work

were not likely to be lost, but it is the great Gothic revival in its various phases by which the nineteenth century will be most closely remembered architecturally. It has lately been the custom to talk slightingly of this revival, and of those great and able men who guided its destines. But gentlemen, to do so is neither just nor generous nor wise. The underlying principles that prompted such men as Rickman, Parker, Pugin, Paley, Scott, Burgess, Butterfield, Pearson, and others too numerous to mention, in their writings and their work, were of the highest and noblest character. These men spared neither time nor trouble in trying, by means of the most careful study of detail, to get into touch, as it were, with the artists who in past ages had left us buildings of such surpassing beauty. We may quibble and find fault with the doctrines of the early purist, who in his enthusiasm to truthfully follow the best detail of mediæval times, fixed arbitrary limits of right and wrong and good and bad in styles, yet in so doing he was only working on the same lines as the purely classic student, who is not content without giving verse and chapter for the proportion of every column and detail used. As in most revolutions, men are carried further than originally intended, with consequent injury to the cause they uphold, so undoubtedly by

The Gothic Revival

much irreparable evil was done by the excess of enthusiasm, under the name of restoration, with the same detrimental effect to the cause they held dear. But the first principles of the originators of the movement being essentially good, much good was bound to result from it; and there are very few architects living whose work has not in some way been influenced for good by the great minds that were connected with the Gothic revival. Fortunately the arbitrary shackles of style no longer bind us to rigid regularity of lines and detail. Men of great power and genius, whose early tuition was received in the Gothic School, have been amongst the first to lead the way in originality of thought and design, such as the late John Sedding, for instance. I have purposely avoided mentioning the names of living architects, amongst whom there are many worthy successors to the genius of the past, but I cannot refrain from mentioning one whose early training was also in the Gothic School, and whose work has had such untold influence on the domestic architecture of this century—I mean Mr. Norman Shaw. A study of his past and present work is, to my mind, a wonderful object lesson in development, but from first to last, whether it be in domestic, public building, or church design, always powerful, always thoughtful, and always artistic. The hard and fast conditions of style having been, by a sort of general consent, removed—what has been the result upon our art?—is the result satisfactory? In some respects, yes, in that the minds of clever men are given a freer scope for originality, or an eclecticism that is charming from the very boldness and knowledge it displays. In many respects, no, in that it gives an excuse for ignorant and badly educated men to thrust upon us such architectural abominations as have lately been allowed to disfigure some of the best streets of the Metropolis under the false name of originality and eclecticism. Emerson says somewhere:—" Great licentiousness treads on the heels of reformation"—and in architecture we cannot claim exception to this rule. But in spite of the

Glaring and Vulgar Designs

that too frequently crop up in our midst, I cannot agree with those who say that the architecture of the day is in a hopeless state. On the contrary, I think from the energy and enthusiasm that is being displayed on all sides in art generally we may take a very hopeful view of the future. Speaking generally, the design and planning of our public and private buildings show a great advance in many respects. Our churches are no longer slavish copies of mediæval work, and many of our houses and their decorations show an honest and often successful striving after better design in all that surrounds us. But there is one class of building which, from its position, and acres of ground that it covers, has, during the present century, assumed a far greater importance than is its due. I mean the modern villa or suburban residence, built by

Speculative Builders,

that surrounds us on all sides. What a terrible legacy of ugliness and bad building shall we leave behind, what a wilderness of worthless bricks and mortar. The demands for this class of building caused by the new kind of life in the present century have, of course, had to be met; but, artistically speaking, how unequal we have been to the task of meeting those demands. How far we, as architects, are responsible, is a question that it would be impossible to answer; but this is certain, that if we compare the ordinary present-day suburban house with a similar class of work carried out even in the last century, the comparison is, I fear, by no means favourable to us. The eighteenth century builders, as a rule, did not sacrifice good building to tawdry ornament. Their buildings were generally substantially built, and even if at times common-place, were at least quiet and reserved in design, and seldom if ever bespattered with the ghastly shams—vulgar terra-cotta ornament and worse than worthless carving.

The Modern House

of the kind is too well known to all to require any description. It assails us in all directions, not only in the suburbs of London, but in the neighbourhood of all our large towns. Nay, more, it is a disease that is contagious, and even the beauty of our homely villages and country roads is disfigured by its unwelcome presence. I do not say that this class of building was always good in past centuries, or is invariably bad at the present day; but this I do say, that there never was a time in which all that is true and good in building, and all that is pure and best in our art, was assailed by a more dangerous, insidious, and potent enemy than the demand at the present day for cheapness and showiness in our buildings, and the apparent indifference of the general public as to the artistic merits of the houses they live in. This mass of dreary ugliness that most of our people have to live amongst must act, and re-act, upon the mind, and do incalculable harm to the cause of art. The question is—How is the evil to be grappled with? First, I think by setting the example of quiet reserve in our own designs, and avoiding as far as possible the outward display of ornament; and when we do have ornament, seeing that it is the very best of the kind that we can get—and above all by never under any condition sacrificing solidity, or the use of the best materials, for the sake of being able to get more ornament in our buildings. Secondly, by doing everything in our power to influence landowners, when leasing or selling property for building purposes, to insist on the insertion of a condition as to some sort of supervision by a qualified architect. What an opening there is for early practice in this field of design for some of the aspiring members of our School of Design, and judging from some of the designs submitted last session, our suburbs would be far more interesting if enlivened by designs by even some of our students. It is not necessarily an expensive house that we desire or ask for. On the contrary, if

The Demand for Small Houses

is to be met, every reasonable and proper economy must be most carefully studied. I can well imagine a rough cast cottage being quite as good in design as a stone building five times more costly. Our aim should be to demonstrate to the public that a comfortable, artistically designed, and substantially built house does not necessarily mean a building that is more expensive than the ill-built erection at present so common, in which so much money is frittered away in utterly vulgar ornament. And here I would especially recommend students to really study the requirements of this class of house, with the view of making designs that shall be at once simple, reserved and artistic in treatment, and economical in construction; they will find it invaluable as practice, and it may be of the greatest use to them in their future career. We architects must be ready to grasp problems in design, whether they be great or small, and many will, I think, bear me out when I say that some of the seemingly small problems are often the most difficult to solve. Amongst other curious experiences I had once a client, who wrote asking me to design a lodge something in the style of Kensington Palace or the Versailles, a problem I met by sending a design which apparently satisfied her, but how far it agreed with her ideas of Kensington Palace or the Versailles I never found out. In my address last year I expressed the wish that

Artists and Architects

could be brought into closer union and sympathy with each other, and during the last years of the nineteenth century the great necessity of this union and sympathy has been very strongly brought home to us. This is neither the place nor time to enter at length upon the subject of the thorny discussion in reference to the decoration of our great Metropolitan Cathedral. But as the subject is of such great interest to architects and students alike, some allusion to it becomes almost a necessity. The objects of the opposition that we, as architects, have offered to the work of decoration must not be misunderstood. I think I am right in saying that most of us desire that our great churches and national monuments should be decked with the very best of all we can offer in art, be it in colour decoration or in sculpture. We must, therefore, beware that our opposition to the present method of decoration is not made use of by those who would denude our churches of all that is beautiful in decorative and sculptured art, and give us in return the bare, whitened sepulchres of a past generation. It cannot be made too clear that our opposition is on purely architectural grounds. I am convinced that the Dean and Chapter of St. Paul's when they started the work of decoration had but one wish and aim—that what they did should be of the best; and I am further convinced that Sir William Richmond entered upon this great work in the same spirit. But, gentlemen, surely the first qualification of any artist entering upon such a work is that he should be in complete and absolute sympathy with the architecture of the building he proposes to decorate. The results have proved that this is unfortunately not the case. Is it then unnatural that we should raise our voices against the injury done to the work of one of the greatest architects England has ever seen? As architects surely it is our duty to do so, and as Englishmen we have a right to ask that the walls of our great national monuments shall not be treated as mere spaces for artists, however clever, to experiment upon. I believe, however, that there is a growing sympathy between artists and architects, and the more we can do to foster that feeling the better it will be for art generally. It will be seen from the report of the last session, that in January, shortly after the publication of the design for the proposed new Vauxhall bridge the committee passed a resolution, stating that they "viewed with the utmost concern the manner in which it is proposed to rebuild Vauxhall Bridge." This resolution was afterwards approved with acclamation at an ordinary general meeting. Now, gentlemen, the Association does not concern itself, as a rule, with matters outside the immediate sphere of its own work, but representing as it does nearly 1,300 members, all of whom are deeply interested in the welfare of art and architecture, it could not look on with simple indifference at the proposal to disfigure our grand river with another ill-designed bridge. Most of the bridges that cross that river now are a standing rebuke to us as a nation. One can only hope that the County Council will use its powerful influence in securing the revision and improvement of the design before it is too late. Sir Alexander Binnie lately stated at a public dinner, amidst applause, that he had "visited and studied all the well-known bridges in Europe, and that, as a result, he hoped to give them one of the finest bridges of modern times." But I would point out, that the study of all the

Bridges

in the world will no more teach an engineer architecture than it would teach an architect engineering. What we desire is that in such a work as that in question, involving an expenditure of a large amount of public money, and effecting, as it does greatly, the appearance of our grand water-way, architects of eminence should invariably be consulted as to the architectural work, while the constructional work could, if so desired, be placed in the hands of well-known engineers. In such works in Paris, architect and engineer work together as as matter of course—why not in London? It is no pleasant task to criticise the work of men of such acknowledged ability as those just named, and we do not presume to do so within the province of their own art or science; but it would be simply cowardice on our part to refrain from criticism when they step into a sphere of work that is not their own, of which they have little knowledge, and with which they apparently have little real sympathy. Gentlemen, I must apologise if my brief review and comments of the work of the nineteenth century have seemed too long for an address of this kind, but, as I said before, standing so near the dividing line between the old and new century, one is almost bound to look back and try to learn from the successes and failures of the past, and how best to advance the interests of our great and noble art in the future. For the last half century the Architectural Association has been working with one pure and high aim — the advancement of architectural education. A voluntary association dependent almost solely on voluntary help and energy. A free and independent association unfettered by ties of professionalism or social class ties of any kind. A social association in which architects, young and old, rich and poor, can all meet together on one level, in social intercourse and good fellowship; and withal, gentlemen, I am glad to say a successful association. What, it may be asked, has been the lever of success? Has it been by capital or financial help given by persons or public bodies interested in educational work? In no sense, with the exception of the yearly grant of £100 so kindly made by the Royal Institute of British Architects, and the very generous donations given by some well-known architects at the launching of the new scheme of education. No, the lever of success has been the sincerity of purpose, the unselfish devotion to the cause, the single-hearted aim and warm enthusiasm of its originators and supporters. As long as men are found to help in carrying forward the work with the same high aim and enthusiasm, so long will the Architectural Association flourish and carry forward its great work with increasing vigour and helpfulness. We, the elder members of the A.A., have reason to fully recognise the value of both the educational and social work of the Association, but under the new system of education its value has increased tenfold; and it is for you, the younger members, to prove that its value is still greater in the future than in the past. It is a healthy sign that so many of our older members continue their membership, and I again appeal to all who are interested in the objects of the A.A. to join our ranks and help us by their membership and advice. When the members of the last excursion were visiting Bryanston, Lord Portman, seeing some elderly gentlemen in our party, asked me if the Association was composed entirely of students. I answered yes, that in our party of twenty-eight there were students whose ages ranged from eighteen to nearly sixty, from men who had been in practice for twenty-five years to pupils in their offices. So comprehensive are the ranks of the A.A. While mentioning the excursion, I must express surprise that more members do not take advantage of it, for a more useful and enjoyable week, both architecturally and socially, it would be hard to imagine. In drawing this address to a close, I would ask the younger students of the present day to remember how great is their responsibility. Upon them, in a great measure, will depend the making or marring of

The Architecture of the Twentieth Century.

It is impossible to foretell what their chances and opportunities may be, and equally impossible to foresee what will be the characteristic style of work of the century, and therefore it is useless to speculate upon the matter. But be sure of this, there is no broad highway to success that is not founded upon the work and experience of past ages. We are not gods, that we may create something out of nothing, but creatures who must make the best use of the materials and gradually growing knowledge vouchsafed to us by a bountiful Creator. Experience teaches us that to succeed at the present day a man must concentrate all the faculties of his mind on one great purpose, and with an unswerving tenacity of purpose. A great purpose is cumulative, and like a magnet attracts all that is kindred along the stream of life. The question is, Can you honestly say that you do, or that you wish to, make the art of architecture a great purpose in your life? If so, and you work conscientiously with that aim, I can safely prophesy your future success and happiness; but, if not, you had far better turn back, and give up all idea of becoming an architect. At best, as I said on a previous occasion, it is

A Hard-worked and Ill-paid Profession,

and if one's heart is not in the work, it becomes a mere existence without a soul. I do not, for one moment, wish to discourage those who are commencing their studies in the art. Far from it. My one great wish is to inspire enthusiasm amongst students who possibly have not realised fully how great is the work before them, and how great is the need of working consistently with one definite purpose. Believe me, I have no wish to make or exaggerate an evil. The evil I speak of—want of enthusiasm—undoubtedly exists amongst some of our students. Far too many make the end and aim of their work to qualify for the R.I.B.A. examination. But, good as I believe these examinations to be in many ways, you must not for one moment think that the passing of examinations will make you an architect in the truest sense. The key to the success of an architect is that his heart must be in his art. Ruskin truly says: "Fine art is that in which the hand, the head, and the heart of man go together, the head inferior to the heart, the hand inferior to the heart and head." Thus, it must be the heart that dictates your actions, or, in other words, real love of art for art's sake that must be your incentive to work. I would that any words of mine could inspire enthusiasm amongst our present and future students—for enthusiasm lifts men out of themselves and the petty concerns of life, it gives life to that which is otherwise invisible, it imparts itself magnetically to others, and fuses all into one happy harmonious unity of feeling and sentiment, and it helps forward the worker and the genius alike. If, as Longfellow says, "enthusiasm begets enthusiasm," then may I hope that my enthusiasm in the cause I am pleading may be imparted to you, and that your enthusiasm, once fired, may be imparted to others. In conclusion, I will only add that if you love art for art's sake you will not be content with obtaining knowledge and success for yourself alone, but will take pleasure in imparting knowledge to others, and thus helping forward, step by step, the great work of architectural education. I cannot end with better words than those of Shakespeare:

> This above all, to thine own self be true.
> And it must follow, as the night the day,
> Thou can'st not then be false to any man.

A vote of thanks was accorded the President on the motion of Mr. H. L. Florence, seconded by Col. Lenox Prendergast.

THE CLERGY AND ARTISTS' ASSOCIATION'S EXHIBITION.

By permission of the proprietors of the late Lord Leighton's house the Clergy and Artists' Association is holding its exhibition at No. 2, Holland Park Road, W., and as the Church Congress draws thousands of people to London just now, the time is very well chosen. The opportunity of comparing its contents with those of the enormous bazaar in the Imperial Institute, to which the said Congress has given its name, is one which should not be missed; the comparison will be greatly in favour of the smaller exhibition, and it should be courted rather than dreaded. The redeeming feature of the "Ecclesiastical Art Exhibition" is the loan collection of objects, which date from the earliest time. They number nearly 1,000 in all, and deserve to be made the subject of more than one article, but I can only refer just now to an item of exceptional interest—a collection of the precious stones named in the Bible. A treatise, taking these as its subject, is published by Simpkin, Marshall, and Co., at a very low price, and is likely to be very much in request, while jewellery as a fine art is being so assiduously practiced. Their merits apart, the stones of the Bible are so many emblems of sanctity, each having its recognised virtue and deserving on this account of all the love-labour that may be bestowed upon them.

To return to my subject, "The Clergy and Artists' Association" and its exhibition. A few general remarks must precede a brief notice of what appears to be excellent, and these will relate no less to house decoration and dress than to the fit and proper adornment of sacred buildings. The objection I have to objects pretending to be what they're not is that there appears to be no limit at all to the amount that may be disposed on the person excepting such as nature has set to the superficies, and the same may be said of all the sham stones that one sees—sham fabrics, sham feathers, sham flowers, &c.—so that the lowest in the social scale when arrayed in their best are usually the sorriest and tawdriest examples of human kind.

Now let us look at their houses. We see the same thing repeated; the same entire disregard of a principle which should be respected, namely, that there should be a sense of space about even the smallest apartment; a reserve of atmosphere in it. If only required for prayer, like a cell, we would have it as bare as we see it in Fra Angelico's frescoes. If for sleep, then just such things should be there as may be looked fondly upon at night-time and again in the early morning, the decoration attuned, as we say, to the *Schlaflied* and Morning Song. I would have a bit of the firmament about everything dear to me: the face of a friend, a pure thought, or a flower. Is this a fair way of introducing a subject, and proceeding to speak of the restraint we should put on ourselves, being artists? Let us have but a little, and that little the best that can be. It has been said, no matter by whom, that a cultivated taste, though it may not be cheaply acquired, saves more in the end than can be computed. Its possessor has not to think twice. He knows that there may be thousands of so-called art works produced, and amongst them the smallest percentage of things which anyone would be any the better for having.

There must be some wisdom in Mr. Hallward's prospectus, for he agrees fairly well with what I have said. "The question of good art in churches is after all not one of money," nor one to be overcome by money only, because large sums are being spent in our churches, and the money is thrown away! Nor is the artist himself so expensive as he is supposed to be, because "instances come under our notice in which he charges less than the trade."

It appears that his association is supplementing the good work of the Society for the Protection of Ancient Buildings without interfering in any way with it. The way that society works is well known. It solicits inquiries as to the best means of treating a building, and simply says what should be done. So here, in like manner, we find a number of cases reported in which entirely disinterested advice has been given. If the applicant says that the parish is poor, he is told that a little will go a long way. The tawdry adornments of Roman churches abroad are amongst the most terrible sights that one sees, and yet we cannot but feel for the innocent givers, because poverty never seems crueller than when the poorest give of their best.

A good deal of the work which is shown is merely indicative of what may be done for a church by the substitution of beautiful things for those that have served hitherto, and it would be unwise to pass judgment upon it. This is particularly true of designs and cartoons for church windows, of which a great many are shown: but other exhibits are so far complete in themselves as to be coveted just as they are—such as this beautiful altar-piece, a painting in oil designed for St. Paul's, Bury, near Manchester. The church was visited lately, and it was observed how complete a reformation had been effected by Mr. and Mrs. Hallward, Miss Bloxam, and Mr. Bainbridge Reynolds, working as one. The style of the church (nineteenth century Georgian Lancet) is depressingly bad, and not even remotely resembling anything truly Gothic; but description would fail, and the work done under Mr. Hallward's direction must be seen to be appreciated. We see here what could have been done had the artist and his associates been perfectly free as at Teddington.

Of unforgetable grandeur is Mr. A. H. Skipworth's organ front, designed for this church, and beautiful, eluding description, is the altar frontal shown by Miss Bloxam. There are very few cases in which the exhibited works seem less than the artists' best, and very few artists, indeed, whose contributions are not very heartily welcomed. I wonder who will be first to disclose to the world the genius of Mrs. Traquair who exhibits a "book of photographs, frescoes, and tapestries." E. R.

A Wise Precaution.—The passenger lift shaft at the Windsor Hotel, Victoria Street, Westminster, has just been fitted with non-flammable wood throughout. This measure of safety from the dangers of fire will be appreciated by those occupying upper rooms in large hotels.

Forthcoming Art Exhibitions.—Next week the Grafton Galleries will re-open with a collection of modern French art. The annual exhibition of the Society of Portrait Painters will be held in January and February, 1900. Next March the New French Club and the Ridley Art Club will hold their exhibitions, and there will also be an exhibition illustrative of the life-work of George Rowney (1734-1802).

THE A.A. SCHOOL OF DESIGN.

OPENING ADDRESSES.

THE preliminary meeting of the Architectural Association School of Design and Handicraft was held on Tuesday, the 10th inst., at 56, Great Marlborough Street, W., at 7.30 p.m. Short addresses were given by Mr. G. H. Fellowes Prynne, F.R.I.B.A., the president of the Association, Mr. W. H. Seth-Smith, F.R.I.B.A., and Mr. Halsey Ricardo. The President warmly congratulated the members on their work in the School of Design; notwithstanding the falling off during the last session, on the whole the work had been most encouraging. He wished to point out the value of the Association, which had grown gradually from the needs of architectural students. He would not mention names, but amongst their members they had men of considerable standing in the profession. The first questions he would ask anyone wanting to join the Association were: Why did he wish to join? and why was he taking up the profession? Was it merely for the love of the work? Many took it up, he was afraid, with the sole idea of it as a profession, and with no actual and real love for the work. Surely that was the wrong way to go into architecture? It was not a trade, but an art! There was a much higher aim necessary in entering the profession, and that was the improvement of the art of architecture; if enthusiasm was not felt for this, the profession should not be taken up, for it was not a well paid profession, indeed it was a very poorly paid one. The seniors of architectural students could not pay them as they should be paid: although a man might be very busy, it might be on small and unremunerative work. The ideal architecture was that which truly united painting and sculpture with it. To accomplish any good in all the arts it was necessary for every student to make up his mind to study painting and sculpture, and equally it was necessary for the painter or sculptor to understand the principles of architecture. The problem of the architect was to know how to deal with masses and proportion, light and shade and general effect, but to do this he must know how to deal with other arts. Architecture was of course more complicated; it was more utilitarian; there were many points to be studied which did not belong to any art, and enthusiasm must be felt, if it could be done, for such subjects.

He supposed everyone about to enter the office of an architect was possessed of some artistic capabilities, and therefore, he would say, the first object was to make oneself absolutely proficient in drawing, which he considered just as necessary as it had been for many years past, not only in freehand but in geometrical drawing. In drawing there was no greater danger than that of inaccuracy; in asking students to study drawing he meant them to study it very deeply. They should make up their minds, also, to do as had been done in the past, namely, measure work, and in connection with this he would mention that the Architectural Union gave a prize for such drawing of old work; this might be an extra inducement. In studying the planning of a building the good points should be things to be found out, for there were too many critics who kept on criticising the little bad points of detail. These bad points would be sure to impress themselves on one's mind without seeking. Although great proficiency in drawing might do immeasurable harm in leading one to make false drawings, generally speaking, proficiency in drawing must be a great help. Absolute trueness in drawing must be insisted upon, if only from matters of policy, for if a client saw a building was entirely different from the drawing, the architect's future was ruined.

Mr. Prynne urged the study of the practical side of building, and he deprecated the cramming to pass examinations, for, he said, that would only make bookworms, and not architects. He urged students to visit every building possible while it was in course of erection, and watch the capabilities of the building and the methods of construction, to get in touch with the workmen, so as to be able to show them how to do the work.

The study of old work was being given up, but this was most reprehensible; if possible, the goodness in other men's works should be grasped, but the work should not be copied, or, in other words, he would say: Build on the foundation of the past. In regard to the question of modelling, he thought it was very necessary for an architect to realise ornament at a height. Modelling gave an enormous advantage in enabling this to be done. A bad thing was the throwing-on of ornament; ornament should not fill up the spaces in a building, but grow out of the design and with the design.

In concluion, he wished to say as few words on the greatness of an architect's work. It spoke of the national characteristics from generation to generation. It might influence the minds of persons in the future, as architecture of the past had influenced them. The aim should be as high as it possibly could be, and to attain any good result, industry and enthusiasm were absolutely necessary. Surely it was unnecessary to say that industry was all in all. In painting and sculpture there were definite lines to go upon, but in architecture there were so many things to study. If anyone failed in his work as a student or as an architect he should not be discouraged, for it was by failures they learnt: how much could be learnt if anyone would have the courage to write a history of failures. He could not end with better words than:—

> If what shone afar so grand
> Turn to nothing in thy hand,
> On again, the virtue lies
> In the struggle, not the prize.

Mr. W. H. Seth-Smith followed with a short address on the application of architectural ornament. He said it was a platitude to say that art knew no rules, that feeling was everything. It would be found, however, that although the instinct of a great painter was his best guide, his exceptional ability would have led him to have analysed the works of his great masters, and to have discovered in all of them certain leading principles in their composition, chiaro-oscuro, or schemes of colour; and that he would, in process of the creation of his own works, be governed, however unconsciously, by these principles, and in the event of criticism might apply them as both a test and as an apology. The presidents of our Royal Academy had at any rate thought it worth while to lay down laws for the guidance of their students.

Be this as it may, genius might always be safely left to take care of itself. All were not geniuses, nor was it possible, whatever tests might be applied, to exclude from the artistic calling men who had very little capacity for feeling in design; hence the importance of ascertaining whether any rules exist by which great errors might be prevented in the application of ornament. It was where art teachers had gone beyond this that more harm than good had been done. As the suggestion of principles for the design of ornament either in form or colour was too complex a subject to enter upon that night, he would content himself with a few thoughts on its general application.

It could not be too often insisted upon that the principal object of ornament in architecture was to give beauty to constructional features, and that by keeping this in view our art might, and would, improve our construction. He would suggest the following principles as headings for consideration:—

(1) Rotundity or modelling of the angles, or, as we all call it, mouldings.—The reasons underlying rotundity were, first, the sense of stability produced by rounded corners, and, secondly, the gradation of light, shade, and cast shadow thus produced. Plinth and base sets-off, pier-angles, shafts and their capitals, arches, and vaulting ribs, &c., were the leading lines calling for such modelling.

(2) Ornament against high light.—This was the lithic rendering of a truth observed by all great painters, namely, that the lights must be beautiful in form. The eye of man, in common with other specimens of natural history, went at once for light Too much thought or care could not, therefore, be spent on tracery, which was clearly evolved in obedience to this great law. Grilles, bars, ornamental lead glazing, and window fastenings had a similar origin. Skylines came under this head. The rule seemed to be that though the general constructive skylines might be very severe, they must be softened by well-modelled ornament. In all satisfactory instances they were rounded in form. In Gothic, the crestings, crockets, finials, gargoyles, &c., produced the desired effect; in Classic or Renaissance, statues and vases, &c., supplied the want. Sharp pointed finials and vases were always painful to behold, whereas a more substantial terminal of good form, producing a dark spot against the sky, was most picturesque. Diapers might also be instanced, and other enrichments of plain surfaces were exposed to direct light.

(3) The richest ornament must not be in the highest lights. He believed it was this reason which led the thirteenth and fourteenth century artists to stain their windows with such deep tones that they should not allure the eye too readily from the architectural ornaments of the interior. In those days the artists worked in unison, and the worker in glass subordinated his work to the great scheme—the one master design. It was only later that the glass-worker sought to glorify himself by white glass and more elaboration of detail, casting patches of shadow and colour to the confusion of the ornament of the interior. And this was further proved by its happening when the area for glazing was at its maximum and less, and not more, light was wanted within. Exactly the same sacrifice of architectural effect to skill in carving was to be seen everywhere in the fifteenth and sixteenth centuries, directly the Renaissance, with its enthusiasm for surface ornament, arrived. It was in the half lights that the great sculptures should be found, and their subject of greatest interest would be led up to gradually, first by means of a frame of mouldings or other architectural enrichments proportioned to the complexity of the sculpture composition. It was only in the depths of the sculpture itself that colour was allowed in the best examples of the best periods.

(4) Solidity.—Enrichments should never be allowed to undercut the constructional lines. Carving was apt to sin here. Architectural carving, in its most simple application, was generally required to beautify awkward transitional spaces, such as the bells of capitals, corbels, bosses, and various other intersectional features. The Corinthian capital was an illustration. Carving tended to reduce the sense of structural resistence, hence, in good Gothic periods, shafts are never enriched. On the other hand, where, as in the Parthenon, the columns exceed in bulk the requirements of superimposed weight, but are needed for other structural reasons, they have to be enriched by flutes.

(5) Concentration on eyeline.—Ornament was interesting in proportion to the thought it embodied, and, therefore, if of a popular character it should, like other good works of fine art, be placed where it would be seen and most valued. In domestic work doorways, fireplaces, dadoes, formed good fields. If of sacred nature it should be in places which would give the best opportunity for reflection. The enrichment of vistas such as the ends of aisles, corridors, &c., was of great importance since the eye was immediately led up to them by the converging perspective lines.

(6) Weathering.—In the best periods much attention was bestowed on protecting ornament from injurious weather. These rules just enumerated should not be rejected, because many beautiful inconsistencies might be discovered, for art was full of charming contradictions.

It must be ever kept in mind that good jointing as an element of constructional beauty was of immense importance in the form of the joint and colour of the cementing material, but this came under the head of textures and not of ornament.

Mr. Halsey Ricardo then followed with

some notes on "Detail." He said he used to hear it said—when he was a pupil—that "a good building could carry off bad detail, and a bad building be saved by good detail." This was consoling; because, whilst good building might be beyond one's reach, one could learn up the correct rules for good detail. But the aphorism unfortunately was not true: Building and detail were not separate qualities. A building could not be put up and by being endued with detail converted into architecture. In putting one stone upon another it revealed thought or want of thought. Detail depended on the way the problem before one was tackled, and the knowledge of the capabilities of the material meant to be used. The more thoroughly the structure of the work was entered into the more interesting the detail became. There would be no want of detail, and the more thought put into work the more pleasure there would be to come out of it. One lived now in a very learned epoch, learning had been most exhaustively collected and summed up, and the tendency was to bolt it rather than to digest it. The matter of detail was approached from the Academic rather than the humorous point of view, and detail became deadly learned and learnedly dead, instead of alive and inevitable. Our point of view, although learned, was artificial. The masterpieces of the past were admired for excellencies other than those for which their creators won their fame. Their work was seen incomplete, and the lack of finish, that would stupefy the artists could they see what we were admiring, was exalted.

All agreed in admiration of the Elgin marbles, yet every Athenian of the Classic age would be horrified to see in what state the temples and sculptures are that are now so carefully hoarded. "The beautiful purity and translucency of the marble," that is talked about, was nothing especial to them, whereas the colour that made them life-like and friendly, that they did value. Much of Greek and most of the Roman work that was seen now, and elaborately measured and reproduced, had lost its fine marble-stucco coating and its delicate nuances of form, as well as colour. The detail of Classic Roman work relied on these refinements, and was incomplete without them; but we had got into such an attitude of estimating these ruins that we should shriek at the notion of restoring them with stucco and colour; we were so out of touch with them that we neither cared, nor wished, to do so. But Classic work and Mediæval work depended immensely for its effect on colour, and so at the outset did the Renaissance. But with the revival of letters came the new point of view, and art became the cult of the learned few and popular no more. The character of detail changed. In the Middle Ages the people identified themselves with their buildings, contributed money, time, and experience—the building was the outcome of many hands and many hearts—with so much ready and passionate co-operation, it rioted in its wealth of detail, and the hands that contributed this enthusiastic labour were the hands that had grown up on the material they were now touching. Every moulding recorded a mason's experience—romance and experience met together in it—each new vault was the outcome of observation, jealous as well as ambitious. A man carved his woodwork to his own fancy in the detail, and recorded with his chisel his view of that perplexed problem —his life. Detail had a point and a sting in it then—it was so very real, and it aimed at being so audaciously real! Then came the learned professionals full of the stores they had gathered from classic grounds, and the "one man" system of erecting a building. He came with his academic principles, his sketches, his scenic frontispieces, his new mouldings and generally exotic view of life. For long one did not see the unreality of his wares. The craftsmen had their tradition: they played up to him as best they could, and, thanks to their tradition, their support was amazingly good; but under the system their tradition weakened. The tasks set them got stranger and stranger and more inexecutable: marble details suitable to the climate of Italy to be executed in granite at Aberdeen: stone details to be rendered in wood, wrought-iron details to be made in cast-iron—how could Art be popular, if these unrealities and ignorances were what she depended on. The more and more "correct" detail got, the more and more foreign and insincere it became, and the more uninteresting, except to the pedant. It was owned, at the time of the Gothic revival, but then there was no fund of tradition to fall back upon, as there was in the sixteenth century, and the revived Gothic was really as baseless as the Renaissance.

What then was the moral? What had we to be after to-day? We had to make our detail interesting, sincere and redolent of the time we lived in. It would be interesting in proportion to the amount of care for it and of heart put in it. It would be sincere and flavoursome according to the amount of knowledge we possessed. Our hand must be on the material. We had all the past to dip into as a vast storehouse, but we were not to ignorantly tease stone into purposeless mouldings nor fret woodwork into unnecessary joinery. Through all the perplexities of each job, the bare facts of the case had to be riddled down to, and then seen how they could be combined and in what guise. Every detail should be questioned as to its function, and unless it could pass that ordeal, disallowed. We lived in new times, when materials were comparatively cheap and labour was dear. There were facilities for transport unknown in even the recent past; there was machinery in superabundant quantity (because not knowing how to use it, it had recklessly driven ahead anywhere and with anything, and our work, if it was to have any vitality, must recognise and make use of these forces. At present they were used in such violence and in such quantity that the man behind them disappeared, and without him went the pleasure and interest. What could be duller, for instance, than a lot of machine-made panelling unless it was smothered in hand decoration. Technically, it was actually superior to hand-made panelling, and it had the beauty of perfection—but something more friendly was wanted than the heartless output of the machine. The help of machines could not be done without, but their work should not be much in evidence. The machine really was to replace servile and unskilled labour; where skilled craftsmanship was wanted there the man must be used. The fearful fertility of the machines had a tendency to alter our standard of what was necessary, and to choke us with a mass of inanities, which were forced upon us to justify this uncalled-for production; and this facility showed itself in restless, purposeless detail. But what was the point of detail? If it was to show how rich we were, it was vulgar and inoffensive; if it was to show that we were thoughful and in earnest, it must necessarily be restrained; if it was to show that we were happy in our work, it should be as widespread as happiness would allow.

A vote of thanks was heartily accorded to Mr. Prynne, Mr. Seth-Smith, and Mr. Ricardo, on the motion of Mr. G. B. Carvill, and they having briefly replied the meeting terminated.

The Theatre Royal at St. Helen's, built in 1890 at a cost of £13,000, was totally destroyed by fire on October 13th.

Kirkcaldy Memorial Halls.—The Adam Smith and Beveridge Memorial Halls at Kirkcaldy were opened on October 11th.

A New Bacon Factory at Devizes, Wilts., has just been erected by Mr. Henry Ash, of Devizes, for the Central Wiltshire Bacon Co., Ltd.

The Design for Saltwood Almshouses, illustrated is one of our centre plates this week, was submitted in a competition, and has not been executed. The author is Mr. Beresford Pite, F.R.I.B.A.

The Death is Announced of Mr. E. J. Cobbett, of the Royal Society of British Artists. He was represented by one or more canvases at the Royal Academy for more than thirty consecutive years.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"My first and last secret of Art is to get a thorough intelligence of the fact to be painted, represented, or in whatever way set forth—the fact deep as Hades, high as Heaven, and written so, as to the visual face of it on this poor earth."—THOMAS CARLYLE.

The Sad Condition of York Minster. ALTHOUGH quite £100,000 has been spent in keeping York Minster in a safe condition during the last seventy years, we are informed that at least £50,000 more must be collected at once if the structure is to be kept from impending ruin. It is said that the west front is so unsafe that the great door cannot be used, and the pinnacles and other decorative details are in such a bad state that the fall of pieces of masonry is of frequent occurrence. An appeal is being made for subscriptions to cover the cost of thoroughly renovating the Minster, and if one of the most beautiful examples of ecclesiastical building is to be preserved for the admiration of future generations, the appeal must be responded to liberally and immediately. Up to the present only £12,500 has been collected out of the £50,000.

Chepstow Castle. IT would be a pity if this ancient Monmouthshire stronghold were to fall into the hands of one of the many manufacturers who seem to be always on the alert nowadays to buy buildings of its description for their purposes. Why they should is a mystery. When it was put up for auction last Thursday it failed to find a purchaser. The auctioneer then remarked that the castle had once been used for manufacturing purposes, and the vendor could not be blamed if it were so used again. Structurally it is, perhaps, the finest of the Monmouthshire fortresses. It is splendidly situated, commanding the mouth of the Wye, and dominating the little town of Chepstow. Its shape is that of an irregular parallelogram, 750ft. in length by from 50ft. to 160ft. in breadth, and the great hall measures 90ft. by 30ft. It contains four courts, the first of which is the Drum Tower. When it was announced about a year ago that the Monmouthshire estates of the Duke of Beaufort were to come under the hammer, it was hoped that the historical buildings remaining thereon would be secured as public property; but Castle Usk has already passed into private hands, and whether Chepstow Castle will or not is impossible to say. It is to be hoped, however, that even now the National Trust may be able to secure it for the people. The historical tower gate, which was built in about the thirteenth century, has been presented to the town by the Duke.

Clergy and Art. THE members of the Clergy and Artists' Association held a general meeting at Leighton House, Holland Park Road, Kensington, last Wednesday evening, to discuss certain draft rules which had been submitted by the committee. One point upon which considerable discussion took place was the relative positions of the clergy and the artists in the Association. The Bishop of Dorchester, who presided, said he did not think the Association would succeed or endure unless it were supported by both professions. Mr. Holman Hunt thought that in the shaping of an institution which was to have the control of artistic matters, they ought not to have the elections from within, but that the general body should elect the officers. Some institutions had suffered because the voice of the body of the profession had not been heard at all. The chairman thought that the clergy would not enter the alliance unless they had a fair share in the control of the committee, but he did not think that they would encroach upon the province of the artists. He thought that the allotment of the work should be discussed in general committee. Eventually the draft rules were referred back to the committee in order that they might bring forward something definite at the annual meeting. To us it seems but natural and fair that each profession should have an equal voice in the control of the association, which has been formed in the interests of both.

What do you Think of Ruskin? Mr. Ruskin was taking a morning walk not long ago near Brantwood, says a contemporary, when he saw a woman sketching the house. With a courteous grace which is intensely his own he addressed her, inquiring her reason for choosing the house in question for her subject. "It is the house of the famous John Ruskin," she frankly answered. "Have you met Ruskin?" she was asked. "No, indeed," she replied. "If I had I would have deemed it one of the greatest privileges of my life!" "Then, madam, if you care to follow me I will show him to you." The artist eagerly followed the guide. To her surprise and gratification, he led her up to the house, and, entering, bade his guest follow. On marched the stranger into the drawing-room, and, then, placing his back to the fireplace—a familiar attitude—he exclaimed, to the amazement of his companion: "Now what do you think of Ruskin?"

St. Leonard's, Shoreditch. The work of renovating the Parish Church of St. Leonard, Shoreditch, is now nearly complete. The church had been allowed to fall into a ruinous condition, although it possesses one of the finest examples of classic spires in England. In Saxon times a church stood on the site of the present building; this was superseded at the time of the Conquest by a Gothic edifice. The present church was built from the designs of Dance, who was a pupil of Sir Christopher Wren. Evidence of the master's influence is to be distinctly traced. The church is composed of three sections—tower, dome, surrounded by Corinthian columns, and spire, which springs from the dome. The body of the building is a fine example of pure Tuscan. Many of the actors of Shakespeare's time were buried in its yard, and from this circumstance it gained the name of the Actors' Church. In the church there is a peculiar monument in representing a couple of large skeletons "tearing at the Tree of Life," and bearing in Latin an epigrammatic inscription which states that the skeletons "were all that the worms had left." The crypt extends under the churchyard into High Street, and contains about 5,000 coffins and the old parish stocks. The stocks are to be mounted near the church as interesting relics.

Its Bells, Clock, Spire, and Interior. The peal of bells in the tower is a very fine one; some of them did duty in the Gothic church. The bells, which number twelve, have been out of order for the last three or four years, but have now been seen to by Mr. Dent, of Cheapside. The clock has four faces, and has been going so irregularly that no reliance has recently been placed upon it. It has now been repaired, and the dials are lighted by electricity. The exterior of the building and spire have been thoroughly renovated, and a scheme of interior decoration, prepared by Mr. J. R. Brown, Harrington Street, Hampstead, has been carried out. The church is now lighted by electricity, installed by Mr. C. H. Doughty, the lighting engineer of the vestry. The churchyard has been turned into a recreation ground, and paths have been constructed. Sir Arthur Blomfield supervised the whole scheme of renovation and decoration, and although so much has been done the cost is estimated at only £2,100, towards which £600 has been raised.

Fashion and Architectural Taste. In the course of a lecture on "The Influence of Fashion on Architectural Taste," read recently before the Glasgow Architectural Association, Mr. Wm. J. Blain pointed out that previous to the last century the styles and fashions of Architecture had a continuous growth and tenacious purpose extending over long periods and brought to decay by political changes and revolutions of thought, but that with the birth of the present century only diminutive growths were observable, lasting only for short periods. The reason for this, in the author's opinion, was the decentralisation of culture, the spread of literature, and the study of modern languages and people, etc. Mr. Blain said that these diminutive growths, which had generally taken the form of revivals of various styles, such as the Classic revival, the early Gothic revival, the Dutch and Spanish revivals, and the modern Georgian revival, had not been without some lasting benefit to Architecture, books having been written, buildings sketched, measured and catalogued, and a vast storehouse of information accumulated about the various styles. The very mistakes of the revivalists had caused a deeper searching and insight into the spirit of old work, and we at last possess the key to the ideal chain of these buildings, thus paving the way to a development of style on a broad basis. In conclusion the author remarked that he had no sympathy with an art which recognised no tradition or style, and that a building without style appeared to him about as uninteresting as a man without character.

Chinamen and Tramways. Examples are constantly recurring of the tardiness of China, a land where matters seem to have made a lasting halt. We are, therefore, not surprised at anything which the Chinaman may do as an exhibition of resentment to Western customs or new ideas. It appears that cable cars have been introduced into Corea, and that several children have been run over and killed by them. With a nation so superstitious as the Chinese, this would naturally be a terrible thorn in the flesh, and the result was that one day several hundred persons burned one of the cars, smashed another, and nearly killed the Japanese and European engineers. What connection is there between electric tramways and drought? Apparently none to us, who have little perception; but, according to the inhabitants of Seoul there is a great deal, and this is the reason why they destroyed the cars.

The Fallen Columns. Reports have recently come to hand of the fall of nine columns in the great hall of the Temple of Ammon at Karnak. Before these fell, the roof of the building, which consists of great square stones, was supported by no fewer than 134 columns. Of these, 122 measured 42ft. in height, and the remaining twelve central columns measured 69ft. by 12ft. diameter. The columns are so huge that they are not true pillars at all, but merely columns of masonry put together in the usual manner. An ordinary stone column, such as Nelson's Monument in Trafalgar Square, is formed of solid stone sections with a metal core, but it was, of course, impossible to obtain sections measuring 12ft. across, so these hollow shells of masonry were erected, and their centres were filled with mortar. It is interesting to note that they belong to the last form of Egyptian pillar, when the desire for flat surfaces on which to record great deeds overcame every other architectural instinct. Hitherto the columns had shown the ribbings which symbolised the bundle of lotus stems, in imitation of which the pillar had originated, but at the time of the building of the Temple of Ammon wall spaces were insufficient for record writing, so the columns had to be smoothed to give yet more space for hieroglyphics.

The Buildings of Pretoria. Now that war is raging in the Transvaal, it may perhaps be of interest to refer to some of the buildings in Pretoria, which, while Potchefstrom is the constitutional capital, is the seat of administration, as Johannesburg is the commercial centre. Pretoria is about thirty-seven miles from Johannesburg, and is surrounded by the Witwatersburg Hills; it is about 4,500ft. above sea-level. The Government Buildings, or Raadzaal, are the chief glory of the town. They have a frontage of 175ft., a depth of 220ft., and a height of 125ft. from the ground to the top of the figure of Liberty on the principal tower. They contain in all 136 rooms, including accommodation for the chief officials, and two chambers for the Volksraad. The buildings were erected from designs by Mr. Wierda, at a total cost of £138,000. They occupy one side of Church Square, in the centre of which is the large Dutch Reformed Church, while all the principal banks have their offices in this quarter. The Supreme Courts are located at Pretoria, and the President's house is there, while the principal railways in the Republic converge to this centre. The population of the town is estimated at about 14,000 persons, of whom about one-half are coloured, these being Zulus, Malays, and Kaffirs.

South Kensington "Rubbish." The exhibits from the South Kensington Museum that have been circulated throughout the country have received varied criticism, but that given at a recent meeting of the Carnegie Public Library Committee at Ayr is the strongest which we have as yet heard of. The Science and Art Committee had proposed to apply to the South Kensington authorities for a loan collection, so that the students might see these works and be imbued with a proper spirit of art.—Mr. R. M. Beveridge got up and said he had seen articles from the South Kensington Museum, and they were the paltriest, dirtiest looking things he had ever set his eyes on. He saw some of their works in Paisley, and they were rubbish. —Bailie Smith said if they wanted works they should get them from local artists. These would be more interesting than articles from South Kensington.—It was resolved that a committee should look into the matter and report. We await that report with feverish impatience.

Keystones.

Change of Address.—Mr. Horace T. Bonner, A.R.I.B.A., architect and surveyor, has removed to his original offices at Nos. 13, and 14, King Street, Cheapside, E.C.

A New Technical School at Dunfermline was opened on October 10th. The architect is Mr. David Barclay, of Glasgow, and the cost is between £10,000 and £12,000.

Mr. Gladstone's Statue, which is to stand in the Houses of Parliament, is making progress, and Mr. F. W. Pomeroy (the sculptor) thinks it will be in position early next year.

New Premises.—Owing to a large increase in business, the Patent Vulcanite Roofing and Asphalte Co. have secured City offices at 2, New Union Street (near Moorgate Street station).

A Memorial Porch at the ancient Abbey Church of Tempringham has just been dedicated by the Bishop of Lincoln. The porch has been erected in commemoration of the Queen's long reign.

The French Pictures at the Berlin Kunstacademie are greatly appreciated. It is thirty years since French artists have shown anything like a general desire to exhibit at the German capital.

Miss Francis Power Cobbe, philosopher and humanitarian, who is now seventy-seven years of age, has offered to bequeath her library of 3,000 volumes to Barmouth. A committee are now appealing for £2,000 to build a library.

New Technical and Secondary Schools at Chippenham are being built from designs by Mr. Robert E. Brinkworth, F.S.I., at a cost (exclusive of site and fittings) of £4,310. The contractors are Messrs. Smith and Light, of Chippenham.

"Eclipse" Roof Glazing.—Messrs. Mellowes and Co., of Sheffield and London, have recently completed the glazing of the new Great Northern Railway Company's Goods Depôt at Manchester, and also of the new engine sheds at Hornsey, London N.

Correspondence.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

To the Editor of The Builders' Journal.

Kirkcaldy.

Sir,—I cannot understand why the authors do not meet the requirements in Question I. (page 134, No. CCXLIII.) on construction by inverted arches between the foundations of the detached columns. The question seems to me sufficiently clear to judge the remedy hinted at.—Yours truly,

D. FORBES SMITH, A.R.I.B.A.

[We do not quite understand Mr. Forbes Smith's point. The method of construction by inverted arches is distinctly suggested in the reply.—Ed.]

"RICKMAN'S GOTHIC ARCHITECTURE."

With reference to the enquiry and answer about this book, which appeared on page 132 of No. ccxliii, we have received a letter from a correspondent who possesses a well-preserved copy which he is willing to sell. If H. R. (Londonderry), who made the enquiry, will let us know his address, we will put him in communication with our correspondent.

A QUESTION OF CULT.

To the Editor of The Builders' Journal.

Dear Sir,—Two of your readers make merry over a little drawing published in your issue for September 20th, entitled "Houses at Claygate." Evidently Aubrey Beardsley, arts and crafts societies, and anything other than the average commonplace, form subject matter for derision by these merry writers. So be it. But, to be quite fair, are the trees and cloudland held up to scorn a whit less absurd than are the sad and labouriously-fashioned realistic architectural trees, which defy alike classification and Nature's laws; and who shall make bold to say whether the average realistic sky is of winter or summer, or of how many suns there be in the architectural draughtsman's firmament, whence emanate those conflicting rays which illumine his realistic picture? Surely these uncertain trees and ambiguous clouds are as manifestly manufactured in the office, and not studied from Nature, as are the most conventional of Noah's Ark trees, or, in your correspondent's nomenclature, "kidney bean" clouds, yet evolved.

A "realistic architectural picture"—save the mark—can never truly be realistic, or, if it ever seems to touch the higher altitude of realism, it passes thereby, and at once, without the category of our definition. Whether, then, accepting the limitations of the architectural palette, it be wiser to ape the sublimely realistic, and become thereby sublimely ridiculous, or frankly to accept the convention in a conventional art, is a matter depending wholly upon the inclination and judgment of the individual draughtsman, rather than upon that of the oftentimes incompetent, but I hope in your correspondents' case, only playful critics.

Is it not, sir, something of a pity, that one whom you term "a well-known architect," should be found flouting at work which, however eccentric, is yet not without ability; and instead of seeking to extend the stronger hand of help to one who, for ought I can tell, may be, and possibly is, a younger architect, and deserving therefore not ridicule, but kind counsel, is content to jeer rather than guide, and apparently to assume that there can be but one standpoint from which the things of even architectural draughtsmanship may be discerned.—Yours truly, M.

To the Editor of The Builders' Journal.

Kirkcaldy.

Dear Sir,—I was more amused at Mr. Mackintosh's sketch of Queen Margaret College, Glasgow, which appeared in the issue of "Building News" for November 22nd, 1895, than at the one illustrated on page 108 of your issue for September 20th, both of which however are to say the least extraordinary. Perhaps Mr. Chatterton and H. T. B., whose letters appear on pages 133 and 134 of No. ccxliii, may have a look at the sketch I refer to and give us the further benefit of their humourous criticism.

I may say that after hearing that Mr. Macintosh's sketch was publicly exhibited—I think at the R.S.A.—I felt hopelessly "gone wrong." These sketches would seem contemporary with the time of Albert Dürer.—Yours, etc.,

D. FORBES SMITH, A.R.I.B.A.

BUILDING BYE-LAWS IN RURAL DISTRICTS.

To the Editor of The Builders' Journal.

New Malden.

Sir,—In your issue for October 4th you drew attention to some concessions granted by the Local Government Board with reference to this matter. At the present time there is a widespread and growing feeling that the Model Bye-laws should be very largely amended, especially in relation to rural districts; but I must protest against the suggestion, supported by your remarks, that they should permit the erection of wooden cottages. This, I am sure, is a step backward instead of forward in the march to sanitary perfection.

My experience is that the cost of keeping a timber framed cottage in thorough repair after it has been erected, say twelve years, is much greater than is usually thought, and is a matter of grave importance to landowners. Although a wooden cottage is a trifle cheaper to build, in a short time it is liable to get into a very insanitary condition, and as rural authorities seldom enforce what power they have to remedy this, it is necessary to discourage as much as possible the erection of buildings which may become a serious danger to the public health. I am convinced that the only really satisfactory method of building cottages is to use the best materials, and in a substantial manner, which reduces the annual cost of repairs to a minimum. Bye-laws such as No. 25, relating to parapet walls, and Nos. 26 and 27, dealing with party walls are quite unnecessary in rural districts, and if insisted upon are the cause of very heavy expense.—Yours faithfully,

GEORGE H. SMITH, P.A.S.I.

[We are pleased to publish the above letter, although we cannot entirely endorse the argument. We shall be glad to hear the opinions of other readers on this important subject, and for the present defer further comments of our own.—Ed.]

New Law Courts at Leeds are proposed to be built.

The Glasgow School of Art has taken new premises at 167, Renfrew Street.

Brechin Cathedral is to be restored at a cost of £9,500 from designs by Mr. Honeyman, R.S.A., Glasgow.

A New Wing to the Ipswich and East Suffolk Hospital, called the Victoria wing, has just been completed. Mr. E. F. Bishopp was the architect.

New City Offices at 15, New Broad Street, E.C., have been opened by Mr. H. Brooks Leigh, architect, surveyor, &c., of 297, Amhurst Road, Stoke Newington, N.

New Engineering Works at Darlington.—Messrs. Robert Stephenson and Co., Ltd., of Newcastle-on-Tyne, have decided to erect engineering works on the site formerly occupied by the Darlington Iron and Steel Co., Ltd., at Springfield.

An Unfortunate Erection.—There has recently been constructed at Bedworth a water tower, the cost of which ran into four figures. But the well won't work, and water is being carried in carts by the North East Warwickshire Waterworks Company. Verb sap.

Professional Practice.

Ayr.—At the last meeting of the Ayr Town Council an account for £47 5s. was submitted from Mr. H. J. Blanc, architect, Edinburgh. The account consisted of £31 10s., fee for plans and report on sites for the new town hall, and £15 15s., fee for supplementary plans and report. The Finance Committee had recommended payment of the £31 10s. only. In moving the adoption of the minute, Mr. Lamb said it had been distinctly laid down before he had been employed that Mr. Blanc was to receive thirty guineas for his services. If Mr. Blanc had prepared a second report, he had done so on his own responsibility, and not on the instructions of the Council. Mr. J. B. Fergusson understood that Mr. Blanc had been instructed by the members of the committee to make this supplementary report. Dean of Guild Morton thought it was a proper course to refuse to pay more than thirty guineas. Mr. Craig said that as a member of the committee he wanted to clear himself; he had not been aware of the instruction. He thought that if the members of the committee present gave the instruction they ought to pay the extra charge, and he declined to be responsible. Provost Templeton said he was one of the four members of committee who had met Mr. Blanc on September 17th last year, and it had then been pointed out to Mr. Blanc that he might have to draw up another report with relative sketches, and Mr. Blanc had agreed to do so. Dean of Guild Morton asked where the instructions came in. Provost Templeton said Mr. Blanc had no orders further than that. The Town Clerk explained that Mr. Blanc had written to him stating that he would like to meet the members of the committee. Some members denied having received any notification of the meeting. On the day Mr. Blanc arrived Mr. Fergusson called at the Town Clerk's office, and there learned that no arrangement had been made for the committee to meet him, the only instruction given being that when Mr. Blanc arrived a message was to be sent to the members of the committee. He certainly had no hesitation in saying that Mr. Blanc had been instructed. If the four members of the committee had done wrong, by all means let them be made to pay the sum due, but it seemed to him to be a very miserable thing to try to reject Mr. Blanc's charges. Bailie Grant said that if the Council had incurred a legal debt they were bound to pay it, no matter who was eventually responsible. Bailie Smith said the Council were not legally responsible, and if anyone had taken it upon himself to represent or misrepresent the Council in incurring debt, it was he and not the Council who should pay for it. Mr. Fergusson moved the disapproval of the minute in so far as it referred to the refusal to pay the whole of Mr. Blanc's account. On the division this was objected to by thirteen votes to five—which means that Mr. Blanc receives £31 10s. only.

Birmingham.—A new permanent circus has been built in Hurst Street from designs by Mr. F. W. Lloyd. To avoid the nuisance of waiting outside for admission, there is a main corridor 288ft. long, into which the audience will be admitted at once. The roof of the building is in one clear span from wall to wall, and consists of eight iron truss principals; it is plastered in adamant and decorated in duresco. The building is 115ft. long, 94ft. wide, and 50ft. high, while the ring is 42ft. in diameter. Accommodation is provided for 4,000 people. The decorations have been carried out by Messrs. Horton and Son. The walls are of deep Indian pink, and the front of the gallery is executed in rich plaster work, decorated in white and gold. The decorative work on the ceiling is well designed, and produces a most pleasing effect. The house and corridor are brilliantly illuminated with the electric light.

Manchester.—The John Rylands Library, which has just been opened, is on a site facing Deansgate, and is bounded on the north, east, and south-west by Wood Street and Spinning Field, both narrow streets containing buildings of considerable height. With a view to obtaining adequate light for the library itself, and to secure quietness, the library is placed on the upper floor, and is set back some 10ft. from the building line. The main entrance is from Deansgate, and the whole of the front is occupied by a spacious vaulted vestibule, above which are the librarian's rooms. A short flight of wide steps leads up to the centre of the vestibule, parting towards the left and right landing on the ground-floor level, and giving access to the cloistered corridors whence all the first-floor rooms are reached. Facing this approach is an allegorical group representing Religion, Science, and Art, executed by Mr. Cassidy. From the vestibule level stairs on each side lead down to lavatories in the basement, and from the landing on the ground-floor level a wide staircase leads to the first floor, giving immediate access to the librarian's rooms and to the main library. The staircase which occupies one of the towers passes into a vestibule in the library proper, and the vaulted ceiling is about 52ft. from the first floor. The library consists of a central corridor about 20ft. wide and 125ft. long, ending in an apse at the further end, which gives an extreme length in all of about 148ft. It is 44ft. from the floor to the top of the vaulted ceiling, and is groined throughout in stone. It is divided into eight bays, one of which is occupied by the main entrance, while the rest open into reading recesses, giving on this floor fifteen recesses, occupied by bookcases. The end bay on either side projects so as to form a sort of transept for the building. The style of the building is Gothic of the fourteenth century. The building is almost entirely vaulted in stone, but where this has not been admissible fireproof construction is used after Messrs. Hanan and Royers' system, the main floors being of a double thickness of fireproof with space between. The material used is mainly stone from quarries in the neighbourhood of Penrith. That used for the interior is Shawk, a stone varying in colour from delicate red to grey; that for the exterior is Barbary plain stone, which has a uniform tint of a darker red. The bookcases have been executed by Messrs. Clements Jeakes, of Bloomsbury Street, London. Nearly all the sculpture, both figures and floral, has been done by Mr. Bridgeman, of Lichfield. The heating is by batteries of hot-water pipes, through which air is passed after filtration through screens from the exterior. The electric lighting has been executed by Mr. Thomas, under the supervision of Mr. Charles Hopkinson as consulting engineer. The electric fittings are by Messrs. Singer, of Frome, Somerset, as are also the coil-cases and much of the other metal work. The plaster modelling is by Mr. George Frampton, A.R.A. Messrs. Morrison, of Liverpool, have carried out the entire work, except the foundations, and Mr. Stephen Kemp has been clerk of works. Mr. Basil Champneys is the architect, and nine years have elapsed since this great Gothic building was first begun.

Sheffield.—On Monday last week the Duke of Devonshire opened the new Pupil Teachers' Centre building, which has been erected in Holly Street. The style adopted for the building is a treatment of Flemish Renaissance. The front of the building is treated with rock-faced Dunford Bridge stone, with Ashlar dressings. In the centre of the front in Holly Street is the main doorway of the building, flanked by mullioned and transomed windows lighting the entrance hall, the composition being finished with a carved stone cornice, with a central pediment bearing on a shield the monogram of the School Board. The porch is formed of moulded pitch pine framing, relieved with columns, &c. There is a dado of glazed bricks, and the upper portion of the walls and the ceiling are panelled in pitch pine. Over the inner door is a large carved composition, introducing the arms of the Board. The windows are filled with leaded lights, and cathedral-tinted glass. On the ground floor there are three class rooms, which, being divided by movable partitions, may be converted at once into a hall 57ft. long by 25ft. wide, for joint classes or lectures. The second floor is arranged similarly to the first, and is approached by two stone staircases. The interior of the building is finished in the usual Board School manner, with white glazed brick linings to the staircases and hall, and cement dadoes to the rooms. All the woodwork is of varnished pitch pine. Burlington desks are provided for the art room, and desks specially designed by the headmaster, Mr. Arnold, have been fixed in the other rooms. Mr. Herbert W. Lockwood, of Sheffield, is the architect, and Mr. James Fidler, Sheffield and Eckington, is the contractor. Mr. Frank Tory has executed the carving, and the ventilating and warming apparatus has been fixed by Mr. William Key, of London and Glasgow.

York.—The children's ward which has been added to the York County Hospital was opened recently, and up to the present time has cost £41,024. Messrs. Demaine and Brierley were the architects for the additions. The new ward is on the south side of the main building, and is approached from the ground floor of the corridor which connects it with another wing. It comprises a ward 70ft. long by 24ft. wide, providing accommodation for eighteen cots, an isolated ward for three cots, a large day room, a ward kitchen, a very convenient sun verandah, and, at the south end, separate bath and lavatory accommodation. The floors of the wards and of the day rooms are laid with polished Indian teak blocks, and all the walls are tiled to the height of 5ft. with grey glazed tiles. Hot water pipes supply the required heat, but there are in addition large central stoves. The building is raised 5ft. from the ground on arches so as to lift it above any damp that may arise from the soil; it is one storey high, and is furnished with a flat concrete and asphalted roof, so that a second storey may be added when required. The erection of the new ward necessitated the removal of the old mortuary, which was very inconveniently situated and arranged, and quite inadequate. A new block has been built at the east end of the main building, comprising a laboratory, post-mortem room, and mortuary.

Professor Goodman on American Engineers.—At the recent opening of the winter session of the Yorkshire College Engineering Department, Professor Goodman, who has just returned from a tour in the United States, gave his views on American engineers and engineering. The Americans, he said, were rapidly remedying the rough and slipshod manner of executing work in their shops. Everything was becoming more solid and stable, and the country was now seriously beginning to compete with us, particularly in the production of iron and steel. Whilst in 1895 we imported only fifty-nine tons of steel from America, during 1897 we received 26,000 tons. The American manufacturer invested his savings in increasing and improving his plant. He put down machinery only to last a few years, assuming that at the end of that time better machinery would be produced, and believing that it was cheaper to throw out machinery from time to time, and get better, than to spend a large sum of money on machinery that would last. Although wages were 50 per cent. higher in the States than in England, the American workman turned out more than 50 per cent. more work. He did not object to work four or five machines. The average American workman held a higher social position than the Englishman; he was better educated, and better treated by his employers. Gambling and drunkenness were almost unknown amongst better-class American workmen. American locomotives, though roughly finished, and though they did not stand the wear and tear of English-made engines, were more powerful, having bigger boilers. Steel freight cars were largely used on American railroads. They carried three times their own weight, whereas wooden ones were only capable of carrying about twice their own weight. Professor Goodman admitted that in public works the Americans were still far behind us.

New Companies.

Worcester Glue, Size, and Gelatine Manufacturing Company, Limited.

This company was registered on September 20th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £5,000 in £1 shares, to acquire the business of glue, &c., manufacturers as now carried on by James Gibbs, at Twybridge Street, Worcester, with title as above, but not as a limited company ; to adopt an agreement (dated Aug. 29th) made between James Gibbs of the first part, H. C. Thomas of the second part, and E. J. Byrne of the third part, and to develop and extend the said business in all its branches.

West Suburban Estates, Limited.

This company was registered on September 27th by Ward, Bowie and Co., 7, King Street Cheapside, E.C., with a capital of £10,000 in £10 shares, to acquire and deal with any land or interest in land and buildings, and to erec and maintain buildings, factories, warehouses &c. The first directors (to number not les than five nor more than ten) are to be appointec by the subscribers. Qualification, ten shares

Stanley Paint Manufacturing Company Limited.

This company was registered on Septembe 27th by Jordan and Sons, Limited, 12C Chancery Lane, London, W.C., with a capita of £15,000 in £1 shares, to acquire an inven tion for a solution for mixing paint, to adop an agreement with R. A. Parkin and G. G Dickenson, and to carry on the business c paint, oil, and colour manufacturers, &c. Th first directors (to number not less than thre nor more than five) are R. A. Parkin, G. G Dickenson, W. Hawley, T. R. Robertson, an T. J. Fletcher. Remuneration as fixed by th company.

William Sharp and Co., Limited.

This company was registered on Septen ber 28th by Janson and Co., 31, Finsbur Circus, E.C., with a capital of £4,500 in £ shares, to adopt two agreements with W. I H. Winton and J. Keen respectively, and t carry on the business of brick, pottery, til and plaster manufacturers and merchant The first directors (to number not less tha two nor more than five) are W. H. H. Winto and W. Sharp (permanent directors). Qual fication of ordinary directors, 150 shares.

Banner and Co., Limited.

This company was registered on Septen ber 28th by Maud and Tunnicliffe, Arund House, Arundel Street, W.C., with a capital £5,000 in £1 shares, to acquire the busine carried on by A. Banner, T. Pennington a H. Southerd, at Cobridge, Burslem, under t style or firm of Banner and Co., and to car on the business of and dealers in sanita earthenware, &c. The first directors (number not less than three nor more th four) are A. Banner, H. Southerd, H. Garlic and J. Draycott. Qualification, 500 shar Remuneration as fixed by the company.

Hinckley Wharf Brick, Tile, and Pottery Company, Limited,

CONTRACTS OPEN.

ENFIELD SCHOOL BOARD.

TO BUILDERS AND CONTRACTORS.

The Enfield School Board invite TENDERS for the ERECTION of a GIRLS' DEPARTMENT and New ASSEMBLY HALL, with Alterations to existing Building, at the Alma-road School, Ponder's End.

Applications for bills of quantities should be sent to the Architect, Mr. G. E. T. LAURENCE, 181, Queen Victoria-street, London, E.C., before OCTOBER 21st, after which date the plans and specification can be seen at the above-named address. A deposit of One Guinea should accompany the application, to be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, on the form supplied, must b delivered at my Office, free of charge, not later than TWELVE noon, on TUESDAY, NOVEMBER, 7th, 1899.

Persons Tendering will be required to sign an undertaking to pay the rate of wages and observe the rules adopted by the London Building Trades Federation, and to find two sureties in £500 each for the due performance of the contract.

The Board do not bind themselves to accept the lowest or any Tender.

By order,
N. HEPWORTH,
Clerk.

School Board Offices,
Court House,
Enfield,
October 4th, 1899.

NOTICE.

WARBLINGTON URBAN DISTRICT COUNCIL.

TO BUILDERS, CONTRACTORS, AND OTHERS.

TENDERS are invited by the above-mentioned Council for the ERECTION of PUBLIC OFFICES, COTTAGE, STABLES, and other works connected therewith, at Emsworth, in the County of Southampton, according to the plans and specifications prepared by Mr. FRANK SWINBURNE (the Council's Architect and Surveyor), and subject to conditions which can be seen at the Surveyor's Office, in West-street, Emsworth, aforesaid, between TEN a.m. and FOUR p.m. (on Saturdays between TEN a.m. and ONE p.m.).

The contractor whose Tender may be accepted will be required to enter into a contract to execute the works and to observe the conditions, and he will be required to provide satisfactory security for the due performance and observance of the contract.

The security offered must be mentioned in the Tender.

Tenders, endorsed "Public Offices," to be delivered at my Office on or before the 28th day of OCTOBER next.

The Council does not bind itself to accept the lowest or any Tender.

By order,
J. W. LOADER COOPER,
Clerk to the Council.

Queen-street, Emsworth,
October 5th, 1899.

October 4th, 1899.

CITY and COUNTY BOROUGH of CANTERBURY.

NEW LUNATIC ASYLUM.

CONTRACT No. 1.

Builders desirous of TENDERING for the ERECTION of NEW BUILDINGS, forming part of the proposed Asylum for the Canterbury Town Council, may see the drawings and specifications at the Office of the undersigned, where they may also obtain copies of the bills of quantities on depositing the sum of £10, which will be returned on the receipt of a bonâ-fide Tender.

Tenders, on the form provided, are to be sent to the Chairman of the Committee of Visitors not later than TEN o'clock on the morning of the 26th inst.

No pledge is given to accept the lowest or any Tender.

W. J. JENNINGS,
Architect.

No. 4, St. Margaret's-street,
Canterbury,
October, 1899.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for RETAINING WALLS and FOUNDATIONS for the proposed new WAR OFFICE, Whitehall.

Drawings, specifications, and a copy of the conditions and form of contract may be seen on application to SIR JOHN TAYLOR at the Office of Works.

Bills of quantities have been prepared for the use of Builders by Messrs. WELCH and ATKINSON, of 10, Lancaster-place, Strand, and Mr. W. H. STRUDWICK, of 41, Wych-street, Strand, and, together with forms of Tender, may be obtained at the undermentioned Office on payment of One Guinea. The sums paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon, on FRIDAY, the 27th inst., addressed to the Secretary, H.M. Office of Works, &c., Storey's-gate, London, S.W., and endorsed "Tender for Foundations, &c., New War Office."

SUPPLEMENT FOR
SURVEYORS · BUILDERS · SANITARY ENGINEERS ·

OCTOBER 18TH, 1899.

BOYLE'S PATENT "AIR-PUMP" VENTILATOR.

THE LATEST PATENT HAS DOUBLE THE EXTRACTING POWER OF EARLIER FORMS AND IS ONE-HALF THE COST.

ROBT. BOYLE & SON. LTD., 64, Holborn Viaduct, LONDON; & 110, Bothwell St., GLASGOW.

See Large Advertisement, Back Page, Monthly.

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

THE LONDON NON-FLAMMABLE WOOD COMPANY Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

THE NEW PARIS WATER SUPPLY FROM LAKE GENEVA.

By EDWARD CONNER.

CITIZENS and engineers are occupied with the periodical shortages in the supply of drinking water for Paris, and are seeking a scheme which will permanently remove the long-standing evil and save the frequent tappings of the small rivers situated within the water-shed of the capital, as well as avoid the constant laying of fresh pipes and the construction of new reservoirs. These stop-gap plans are only at best but mere instalments of a definite solution; they are very dear, and, in a word, unpractical. For the last seven years Engineer Duvillard has been advocating the taking of water from the Lake of Geneva at a spot called Hermance and conveying it in the usual way to the proposed reservoirs at Clamart, a suburb of Paris. The distance from the lake to the reservoirs is 317 miles. The fall during the flow would start from an initial height of 406yds. and descend to a level of 110yds. The cost of the work is estimated at 450 millions of francs, or eighteen millions sterling, and though the scheme is a costly one it is accepted as being a necessity for the welfare and good health of the inhabitants of Paris.

The Lake of Geneva, or Leman, is the largest and deepest lake in Eastern Europe. In shape it resembles a graceful crescent. It is surrounded by the cantons of Valais, Vaud, and Geneva; on the southern side by Savoy, and on the west by the Alps, with a land-point protruding into the Jura. France owns about one-fourth of the basin, which empties its waters into the lake, as well as one-third of the superficies of the latter, and thirty-three miles of the lake shore. The greatest length of the lake is fifty-six miles, and its greatest width four and a half miles. It is 1,218ft. above the level of the sea, and its depth, which has been the object of several interesting experiments, is generally fixed at 328 yards between Vevey and Meillière, and at 82 yards at Geneva, where the lake in a narrow spot at Nyon takes the name of Geneva, or the Little Lake. Its navigation is not without danger; storms are both sudden and violent, and there are bad currents; while good sized waves are often seen. Occasionally the water suddenly wells or lumps up to a height of nearly two yards, falling as rapidly; this is attributable to the unequal sectional pressure of the atmosphere. Mirages are not uncommon, so is the appearance of the "Fata Morgana," the Italian fairy of the lake.

Though Lake Geneva is subject to redoubtable tempests and formidable waves, it has no tides. It has been calculated that were all the rivers that flow into the lake to suddenly stop it would require ten years for the lake to empty itself dry into the ocean. The French decline to listen to any proposition from the Swiss engineers with regard to the utilisation of the waters of Lake Neufchâtel as a substitute. This lake is situated entirely in Swiss territory, and its waters flow directly into the Rhine. The waters of Lake Geneva are chiefly composed of melted snows and icebergs from Savoy, and pass out by the Rhone Estuary, which is a French river, while the shore of the western extremity of the lake is also French; this is precisely the point where it is proposed to lay down the necessary piping to convey the water to Paris.

The project has been examined by both the French Government and the Municipality, and is claimed to be the definite solution of the city water question. It will yield pure and fresh water at all heights, for all purposes, and to all persons. The director of the municipal waterworks fixes the amount of water that would be allotted to each inhabitant at 72 gallons a day. The population of Paris is now two and a half millions, and by the year 1930 it is calculated to increase to 3,400,000. The suburbs by that time will have a population of 800,000 individuals. For a population then, say, of five millions, at the rate of 72 gallons daily per head, as much as 1,815,000 cubic yards of water will be required. Of course, less than this will be needed when the season is cold and wet, but 30 per cent. more during the summer. The "special" potable water at present distributed in Paris costs the city 11 to 12 centimes (or a fraction over a penny) per cubic metre. The water of the Seine, all expenses included, costs between six and seven centimes (a fraction over one half-penny) for canals, factories, and matériel. To this must be added two more centimes (five centimes equal ½d.) to defray the cost of raising the water to the required altitude for pressure in certain parts of the metropolis. The new Geneva supply will naturally abolish this outlay, and will thus represent an economy for "subscribers." Scientists agree that the water in the Lake of Geneva is the purest and healthiest in Europe. There will be no necessity to filter it on its arrival in Paris. As already remarked, it is produced from the melting of the snow and ice during the great heat in summer; the Seine and Loire rivers owe their supply to rains, that decrease as summer approaches. As soon as the new supply from the Lake of Geneva comes into operation there will be less low water intervals in the Seine, and plenty of water left for flushing the sewers now so abominably dry and repulsive during the hot summer months.

M. Lèon Massol, director of the laboratory of bacteriology at Geneva, has made no fewer than 1,338 examinations of the water of the Lake of Geneva, and he concludes by stating that it cannot be surpassed for hygienic excellence. Messrs. Fol and Durrant have found the number of living germs or microbes in this water to be only 38 per cubic centimètre; in the case of the Paris waters, the Vanne, for instance, which is considered the best of its kind, contains 1,250 microbes per cubic centimètre, the Avre water contains 2,886, and the Dhuis water 3,825 for the same quantity. The following table shows the official analysis of one litre (1¾ pints) of water taken at the surface of the Lake of Geneva:—

Gases, per cubic centimètre:—	
Oxygen	6·85
Nitrogen	14·96
Carbonic Acid	2·85
Solid matters, in milligrammes:—	
Chloride of Sodium and Potassium	1·8
Sulphate of Sodium	15·
Sulphate of Ammonia	traces
Sulphate of Lime	47 9
Carbonate of lime	73·9
Nitrate do. do.	1·
Carbonate of Magnesia	17·
Silica	3·7
Alumina and oxide of iron	1·9
Organic matter and loss	11·9
Total	198·76

The pipe waters of Paris contain from 240 to 288 milligrammes of mineral matters per litre, and from 40 to 59 of gaseous or volatile elements.

The Lake of Geneva is fed by twenty rivers or streams that bring the water from a basin of 8,000 square metres, 1,100 of which are covered over with icebergs or perpetual snows. The difficulties of the project arise in connection with the navigation of the French Rhône, which is the discharge river of the lake. In 1883, the City of Geneva, in the name of the lake-side cantons, regulated the height of the waters. In its natural or wild state, the level of the lake varied 2⅘ metres between high and low extremes. Works were undertaken in the form of dams, so that since 1890 the variation does not exceed ⅗ of a metre (say 2ft.). But the outflow during the period of the melting of the snow is greater than hitherto. Thus, the volume of water that did not formerly exceed 560 cubic metres per second is now 700 cubic metres; the result of such an excess is to augment floods and cause greater interruption of navigation on the Rhône. It is apprehended that by taking water from the Lake of Geneva the navigable conditions of the Rhône will undergo an alteration.

During eleven months in the year navigation on this river is normal pending fourteen days, it is completely unnavigable on account of floods and ice; while during fourteen other days transport on the river is attended with serious difficulties. The water of the Rhône can descend to as low as 48in.; while during seventy-five days in the year it varies in depth between 80in. and the minimum 48in. In order to remedy this state of things, the Geneva-Paris Water Company propose to construct two immense reservoirs, capable of containing 160 million cubic metres of water, which will be emptied into the Rhône when it falls too low and so impedes navigation. Another proposal is to modify the level of the lake itself by 12in. as a reserve (the quantity of water being 160 million cubic metres), and so provide for the dry season of the Rhône. These are the apparent obstacles to the scheme.

As interest will have to be paid on the money borrowed to construct the existing water supplies and their works of distribution, the Municipality of Paris will need to see their way very clearly before placing a new debt of 450 millions of francs on the shoulders of the citizens. At Hermance, the adduction piping would be placed at a distance of 437 yards from the shore, and 52 yards deep in the lake. There would also be built a subterranean aqueduct from the starting point to the crossing of the Rhône; thence the piping would continue a perfectly straight course to Macon, which is 225 miles from Paris. At a distance of 162 miles from Paris the piping would cross the river Loire. Within fifty miles of the capital it would be in the vicinity of Fontainebleau, arriving at Versailles, to its terminus on the heights of Clamart overlooking the city and the Seine. It is estimated that the scheme would take four years and a half to complete. Of the total cost of 450 million francs, the steel piping alone would absorb 62 millions, the aqueducts 33 millions, the reservoirs at Paris 12 millions, and the whole subterranean works 199 million francs. Along its route the Geneva-Paris Waterworks will traverse forty-five towns and villages, as well as twelve more or less important rivers.

Another Thames Tunnel.—The West Middlesex Water Company intend to construct a tunnel, 14ft. in diameter, beneath the river at Richmond, to convey their new main.

A New Canadian Canal—the Soulanges Canal—has just been completed, at a cost of 5,250,000 dollars. It gives uninterrupted inland navigation for vessels not drawing more than 14ft of water from Quebec to the head of Lake Superior, a distance of 1,435 miles.

Six New Light Railways in the Suburbs of London are recommended by the Highways Committee of the London County Council. Overhead and underground systems will be employed. The latter is the more expensive, costing about £15,000 per mile of single line, while the overhead system costs about £12,000.

International Tramways Exhibition in London.—On June 30th next year there will be opened at the Agricultural Hall, Islington, an International Tramways and Light Railways Exhibition. This will be the first thing of its kind ever seen in Europe, though for several years there has been an exhibition of tramway apparatus and appliances at the annual meetings of the American Street Railway Association. An excellent list of patrons has been secured for the new exhibition.

Electric Light for Villages.—As a rule a village that is not situated near some good-sized town is lighted by dim oil lamps or is not lighted at all. But at Hartford, in Gloucestershire, which has about 800 inhabitants, a reform has been successfully carried out by introducing the electric light. The installation consists of twenty-nine lamps, the cost of thoroughly efficient maintenance being no more than £60 per annum, which is to be provided for by a rate of 2¼d. in the pound on houses, and ¾d. in the pound on land. As the rent of labourers' cottages does not average more than £5 a year—it is generally less—the charge per head to this section of the population will be about a penny a month. In return, the Hartford workmen will have their village brilliantly lighted.

Masters and Men.

Dundee Plasterers' Labourers Dispute.—The strike of plasterers' labourers in Dundee, which has been in progress for the past nine weeks, still continues, and there are about sixty men unemployed.

The Strike of Tinplate Workers in Bolton District has been settled by the masters granting an immediate advance of 1s. per week. The men promise to consider relaxations in their apprenticeship rules.

Dispute in the File Trade.—A considerable body of Lancashire steel file makers have been out on strike at Warrington for some weeks past. These men, though the work is arduous and dangerous to health, have only been paid at the rate of 4½d. an hour, and it requires prolonged hours, and even day and night work to earn 27s. a week. The men demanded increased pay amounting to 1s. a week, and this has been conceded by all except one firm. There are now about 350 men out on strike.

Nottingham Building Dispute. — The dispute between the master builders of Nottingham and the National Association of Operative Plasterers, which it was understood was settled at a conference a week ago, appears to have assumed a new aspect. The Association at Nottingham have declined to stand by the resolution of the National Association of Plasterers, on the ground that the dispute really is between operative bricklayers and plasterers. The point of difference is the demarcation of work.

Reconstitution of the Trades' Union Congress.—The Parliamentary Committee of the Trades Union Congress have decided to formulate a scheme for altering the standing orders of the congress with a view to meeting criticisms such as those of Mr. T. Burt, M.P., who recently declared that the congress was not to-day an efficient machine for the purposes for which it was formed. The scheme of reconstitution will be settled in detail during the next few months, and by the end of February it is hoped it will be in the hands of the unions represented at the Plymouth Congress, so that time may be given for the discussion of it before the congress meets next year at Huddersfield.

Workmen's Compensation Act Case.—At the Marylebone County Court, Judge Stonor, in giving judgment last week in the case of Bennett *v.* Aird and Sons, said the applicant in this case was employed by the respondents striking an iron wedge to open a road, underneath which water pipes were being laid by them. Another workman was striking the wedge alternately with the applicant, and knocked it on one side, and thereupon the applicant's hammer missed the wedge, swung right round, and dislocated his shoulder, which he had since been unable to use. The manager, who appeared as representative of the respondents, submitted that the case did not come within the Act. The learned judge, after considering the construction of section 7 of the Act and the significance of the words "mechanical power," said that on the whole he thought that the words "mechanical power" must in the present case be construed as *ejusdem generis* with those mechanical powers previously mentioned—viz., "steam and water," which act automatically and continuously after having been set in motion in the first instance by manual labour, and he therefore, on the whole, was of opinion that the present case did not fall within the Act, and gave his award in favour the respondents, without costs.

The Hull Building Trade Dispute.—A meeting of the Hull Master Builders Association was held at the beginning of last week to consider the latest phase of the dispute. The subject matter before them was a confirmation or otherwise of the proposals of their own committee to terminate the dispute by permitting the men to return to work upon the old terms, and to refer all disputes to a Board of Conciliation. The only point at issue between the committee and the men's union was the extent to which the latter clause should apply. The men were agreeable to a settlement on these terms, subject to it being made clear that only any future, and not the present dispute should be referred to the proposed Board of Conciliation. The bone of contention seems to have been the employment of non-union men. Agreements have been made with non-union men, under proper legal documents, for a term of years, and the firms which have done this neither consider it honest nor just to these workmen to throw them aside, without any consideration whatever in conceding the demands of the Union. There is a section of the masters, who, while supporting the strike, morally or financially, have done nothing to assist in the settlement by employing free labour; they have preferred to wait and have their old employees back. These masters, consisting of Messrs. F. Blackburn and Son, Mr. Goates, Mr. Beilby, Mr. Greenwood, Mr. Hanton, Mr. M. Harper, Mr. J. T. Skinner, Messrs. Sanderson, Mr. Wood, and Mr. W. G. Bray, president of the Masters' Association, have dissociated themselves from the policy of the majority of the members of the Association, and have sent in applications for the return of their men. All the bricklayers on the Society's books have been spoken for by these firms, and all the joiners with the exception of twenty. The joiners are being taken back on the old conditions, and are being given the halfpenny per hour more asked for. Other masters may now follow suit, but if not, there is likely to be considerable difficulty for the architects in making up a whole tender, as the contractors are nearly all of separate trades, and if one contractor is employing non-union men the others will not be able to get their union-men to work with the others. It is a most reprehensible position for the men to take up, for all must live, and should work side by side with amity.

The Creuzot Strike has been settled by M. Waldeck-Rousseau, acting as arbitrator between the employer and employed. This discussion at the conference was limited to six principal claims of the workmen. The decision is that: (1) The Creuzot Company is bound to pay the increase in salaries or piece-work promised in June, 1899, without reference to the success or failure of any contracts made between the Company and its contractors or clients. (2) As the workmen's unions are legally authorised organisations no special authority is needed for their recognition; that although the arbitrator cannot oblige an employer to consider the union as an intervening agent between his workmen and himself, it is natural and logical that in all questions relating to labour interests the union should serve as a medium between the two parties. But, although the agent of the union to which one of the parties belongs can be usefully employed as an intermediary if both parties consent, he cannot be imposed upon the employer. (3) Note is officially made of the declaration of the Company that its overseers will be instructed to make no distinction between workmen belonging to the labour union and those who do not, and that no interference will take place with the political or religious acts or utterances of the workmen outside the workshops. (4) One delegate will be selected from each shop and each guild every two months, except in urgent cases, to confer with the representatives, and, if need be, with the directors of the Company. (5) No workman shall be dismissed for having taken part in the strike. (6) In case of eventual stoppage a rotation shall be established between the workmen of the same class, and the proportion between union and non-union men who are obliged to remain idle shall be regulated in each department, according to their number, due account being taken in this rotation of those workmen who have families. M. Waldeck-Rousseau announced to the delegates that the Government had decided to present a Bill to the Chamber as soon as it meets in November for the better working and execution of the law of 1884 upon workmen's unions. It was M. Waldeck-Rousseau himself who proposed this law of 1884, and succeeded in having it adopted. It is stated that it will cost nearly 2,000,000 francs to bring the plant at the foundries into working order, while the loss to the strikers in wages is estimated at 1,000,000 francs.

Surveying and Sanitary Notes.

A Main Drainage Scheme for Bristol has been adopted by the Bristol City Council. It is estimated to cost £490,000.

Mr. William Roberts, surveyor, of Edenwood, Whallay Range, and of Manchester, who died on February 18th last, left personal estate valued at £15,966.

Leeds Sewage Disposal. — The Leeds Corporation Sewerage Committee have sanctioned the carrying out of two experiments at Kewstrop in connection with the continuous filtration of crude sewage.

New Sewage Works at Hampton were opened, on October 14th, by Sir F. Dixon-Hartland, M.P. No chemicals whatever are employed in the process and no sludge remains after the sewage is purified.

A Sanitary Precaution.—All the building materials in connection with the demolition of property in Leed's insanitary areas are to be destroyed, with the exception of the bricks, and these may be used for concrete only.

Proposed Names for London's Great New Street.—The following names have been suggested for the new street that is to be made from Holborn to the Strand: "Imperial Avenue," "Victoria Avenue," "Albert Edward Avenue," "Salisbury Avenue."

Proposed Sewage Works at Marple Bridge.—A Local Government Board inquiry was held on October 12th into the application of the Hayfield and Mellor Rural District Council to borrow £4,310 for laying mains in Mellor, making a connection with the adjoining township of Ludworth, and sharing in the cost of the outfall works. No opposition was offered.

Surveyors' Institution.—The president, Mr. T. M. Rickman, held two conversaziones on Thursday and Friday, October 12th and 13th, on the occasion of the formal opening of the new premises of the Institution in Great George Street, Westminster, S.W. The building has been designed by Mr. Waterhouse, and is very commodious. It has a handsome staircase decorated in two kinds of marble.

A Filthy Town.—Oporto recently became the topic of the hour on account of the plague, and if what is stated about the sanitary state of the town is true, it is surprising that everybody there is not dead. We are told that the town has a bad water supply, no drainage, a soil saturated with filth, no proper disposal of refuse, general overcrowding, and extreme poverty. A few British sanitary requirements would do a deal of good.

Kilmarnock New Waterworks.—Something like a deadlock has occurred in connection with the Kilmarnock Waterworks extension. The new dam, erected at enormous cost, has been found to be defective. The engineer is ill, and his partner declines to meet or consult with the Committee unless the Convener withdraws an adverse comment on the work. At a special meeting on October 11th the Council adopted a motion empowering the Committee to take what steps they may consider necessary.

Builders' Notes.

A Destructive Fire broke out on October 10th at Messrs. Roberts and Cooper's saw mills and timber yards at Brierley Hill, South Staffordshire. The damage is estimated at £50,000.

The Paris Exhibition.—An accident occurred on October 15th at the buildings in connection with the forthcoming exhibition. A wooden structure, 60ft. high and 105ft. long, suddenly collapsed. Nine workmen were more or less injured, but it is hoped, however, that all will recover.

A Model Chimney Shaft is about to be provided at the new power-house for the electric system of the London United Tramways Company at Chiswick. The new chimney, which is of American origin, is built mainly of steel, and lined with fire bricks. It is first of the kind constructed in England. The plans have been approved by the District Council.

How Old is the Carpenter's Plane?—Amongst other articles several iron implements have recently been unearthed at the Roman city of Silchester, which appear to have been the tools of a carpenter and a coppersmith or silversmith. The principal specimen is a carpenter's plane of quite modern type, although unquestionably more than 1,500 years old. There are also three or four axes, retaining their fine cutting edges and still quite serviceable; a number of chisels and gouges of all shapes and sizes, hammers, adzes, saws, files, &c. This is undoubtedly the most important find at Silchester since the discovery of the bronze Roman eagle, now at Strathfieldsaye some years ago.

Obstructing a Highway: Surveyor Fined.—James Smith, surveyor to the Tong District Council, was summoned, at the Bradford West Riding Court, on October 12th, for causing an obstruction by leaving a quantity of stones on the Bradford and Wakefield highway. It appeared that the defendant left a large quantity of road metal in heaps upon the road for several days. At night there were no lamps for the protection of traffic, but although several narrow escapes occurred, no serious accident happened. The defendant pleaded that the practice was followed by the surveyors for several other authorities in the district. A fine of 5s. and costs was imposed, with the alternative of seven days' imprisonment.

Chubb and Co.'s New Works.—Messrs. Chubb and Co., the well-known lock and safe makers, have opened a new works at Wolverhampton; these do not supersede, but are in addition to the well-equipped works in the Old Kent Road. The architect is Mr. Charles W. M. Mitcham, of London, who has been assisted by Mr. F. Beck, of Wolverhampton. The works have an area of nearly 20,000 superficial feet, are five storeys high, and are of red brick with stone facings. Electric light has been fitted throughout, the current being taken from the Corporation mains, and the workshops are airy and well ventilated. One of the chief features of Messrs. Chubbs' business is that for the whole of the eighty-one years of its existence the active managers have belonged to the family of which Mr. Charles Chubb (the inventor of the Chubb lock in 1818) was the head and founder.

London County Council.—At the meeting of the L.C.C. last Tuesday it was decided to spend £1,000 for enquiries and preliminary designs in connection with further asylum accommodation, including the visiting of foreign asylums. The recommendation of the Public Health Committee, to appeal to the High Court against the decision of the magistrates in respect of the registration of Salvation Army shelters as common lodging houses, was adopted. It was agreed to make a representation to the Local Government Board of the Vestry of St. Pancras having failed to appoint a sufficient number of sanitary inspectors. The Fire Brigade Committee reported that the additions to the Whitechapel fire station (the contract for which had been let to Mr. B. E. Nightingale for £3,657) would be begun shortly. A letter of resignation was read from Lord Onslow.

Stealing Lead from Roofs.—The solicitors' table at the Dewsbury Borough Court on October 10th was covered with pieces of lead stripped from the roofs and sides of buildings, and weighing more than 4cwt. The lead had been found in the possession of Walter Smithson, general dealer, Dawgreen, who was charged with receiving it, well knowing it to have been stolen; and John W. Moorhouse and Thomas and John Kelly were brought up on remand for stealing the lead. Smithson turned Queen's evidence, and admitted having bought various lots of lead from the Kellys and Moorhouse, part of which had been stolen from the roofs of houses in Dawgreen. Moorhouse, against whom nothing was known, was fined 15s. and costs. Thomas Kelly was committed for one month, and John (six previous convictions) for three months, both with hard labour. Smithson was severely reprimanded by the Chairman of the Bench.

A Futile Claim for Injuries.—At Yarmouth County Court on Thursday, Harry Davey, a labourer, sued John Ward, a builder, to recover damages at common law for injuries sustained while following his employment. Plaintiff said that on April 27th, while engaged on the upper tier of the scaffolding of a house, he was ordered to haul up some spars, but when he stooped down with the rope he stepped upon a plank, one end of which projected some distance over the support, and was not secured, with the result that it tipped up, and he fell to the ground, a distance of 30ft. He was taken to the hospital, and had since been under medical treatment for nine weeks. His wages were 4½d. per hour, and during all that time he earned nothing. The judge asked what negligence was complained of. For the plaintiff it was contended that the scaffold was improperly erected, in that the end of the deal projecting over the putlock should have been made secure. One witness said that had the planks been nailed down the accident would not have occurred; they were nailed afterwards. It was rare for scaffold planks to be nailed, but something should have been done in this case to secure the plank. Another witness said that the scaffold boards used were 8ft. long, and overhung the bearers 20in. He did not consider this safe. The judge said that there was no proof of negligence. The action had been entirely misconceived. If plaintiff brought an action under the Workmen's Compensation Act there would have been no necessity to go into the question of negligence. So far from this scaffolding being defective, plaintiff's own witnesses proved that the scaffolding was erected in the ordinary way. Scaffolding work was risky, and the fastening was only being wise after the event. He could not understand why the action was brought under common law, where plaintiff stood a chance of being beaten, when under other Acts he must have succeeded. All this expense had been incurred through the action being misconceived, and now plaintiff must begin *de novo*. There would be judgment for defendant with costs.

Iron Felt.—This is a new German insulating material which consists of long, strong, woollen fibres, impregnated with petroleum and coated with gelatine rendered insoluble, and also with rubber, which is afterwards vulcanised. On being subjected to heavy pressure, the felt assumes the form of plates, highly elastic and practically imperishable, which will bear an enormous weight, and whose surface is so hard as not to be cut by the sharp edges of bolt heads or iron girders. Placed as a cushion between rails and their chairs or sleepers, under plummer blocks, or between engine sole plates and their foundation, this substance is stated to prevent vibration.

Trade and Craft.

NATURAL AND ARTIFICIAL VENTILATION.

Messrs. Robert Boyle and Son, Limited, 64, Holborn Viaduct, E.C., have published an interesting and comprehensive little book on "Natural and Artificial Methods of Ventilation," which demonstrates the comparative values of the different systems. It gives some interesting notes on how natural ventilation may be successfully achieved with very simple means by an intelligent comprehension of the laws which govern the movements of air, and the utilisation of the powerful natural forces which are always in operation. Several pages are devoted to excerpts from the published accounts of the opinions of accepted authorities on ventilation. Towards the end of the book are coloured diagrams illustrating the superiority of a natural system of ventilation over an artificial one. Extracts are also given from the official reports of commissions on ventilation, appointed by the British, French, and American Governments, in which are described the evils of forced downdraught ventilation and of hot-air heating, and the dangers of open window ventilation in cold weather. We have all experienced at some time or other discomforts in a hall which is ventilated by one of the many downdraught systems. But in such a hall a cold is not the only thing to fear. On page vii. of the supplement to this valuable little work it is shown how in a hall ventilated on the downdraught principle, the air is delivered by fan propulsion just over a gallery, and is taken out at the floor, the air vitiated by the respiration of those seated in the gallery being thus forced by the downdraught to be reinhaled by those seated underneath. In halls with galleries it is almost an impossibility to arrange downward currents so that the air rendered impure in the galleries shall not contaminate that which is descending to supply the main floor below. It is also difficult to prevent the supply of air for the floor being drawn aside to the galleries. The advantages of a natural system are shown at the end of the book, where a diagram of a schoolroom is given. The radiating inlets for fresh air, screened and warmed, are on the floor and connected with openings through the external wall. The fresh air is thus properly supplied to the pupils and the products of respiration are driven through a foul air exit in the ceiling into the outside air. The proper diffusion of fresh air, cooled or warmed, is secured by its admittance at a low velocity through inlets at each side of the room. The work proves what should be apparent to all—that natural ventilation properly manipulated is far superior to artificial methods.

Failure of a Great Engineering Firm.—Messrs. Maudslay, Sons, and Field, the well-known engineers of Lambeth and Greenwich, are so insolvent that the wages bill, about £3,000 a week, cannot be paid without borrowing from week to week. Mr. Justice Darling, in the Chancery Division on October 11th, continued the appointments of the present manager and auditor, and gave them authority to raise a further sum of £1,500. It was mentioned that there would be nothing left after the debenture holders were satisfied.

Petroleum for Keeping Down Dust.—It appears that recent experiments made by the Pennsylvania Railroad Company with crude petroleum sprinkled over the tracks have not been entirely satisfactory. According to one authority, many fires have been caused by sparks falling on the oil, but, on the other hand, it is contended that that could not be the case, as all the combustible qualities in the oil had been abstracted. It has, however, been discovered that mosquitoes, which infest large portions of the country through which the railway passes, are being made very uncomfortable by the odour; and, as a consequence, are fast disappearing, so that at least one useful result has been obtained.

Engineering Notes.

Cleethorpes is to be lighted by electricity.

From Cairo to the Pyramids is the route of a new electric tram line that has just been opened. The distance is eleven kilometres.

Aberdeen Corporation Tramways are proposed to be extended and equipped throughout with electricity, at an estimated cost of £279,951.

A Railway from Alexandria to Shanghai, to compete with the Russian Trans-Siberian line, is reported to be promoted by an English syndicate.

The Temporary Bridge at Kew, which has taken about eight months to build, was opened on October 12th. The contractor states that the new bridge will be finished in two years' time.

Glasgow Water.—It is calculated that 380 gallons of pure water are delivered in Glasgow for every penny paid. The water is so soft that it is said Glasgow householders can pay their water rate out of what they save on soap.

The construction of a tramway from Hammersmith to Richmond, on the overhead electric system, is a scheme for which the New Electric Traction Co. intends to promote a Bill next year. The Company also proposes to construct a new street through the most crowded part of Richmond at its own cost.

New Purifiers at Ipswich Gas Works.—An important installation of new purifiers has recently been added to the Ipswich Gas Light Company's works near the Dockside. The consumption of gas in the town has doubled within the last fourteen years, and the gasometer power was considerably increased a year or two ago. The new purifiers that have necessarily been erected are in a house built of brick, 126ft. long, 63ft. broad, and 26ft. high to the eaves, with a steel roof covered with slates. The purifiers are formed of cast-iron plates, which, when put together, have the appearance of a large rectangular box, 120ft. long, 60ft. wide, and 5ft. deep, occupying nearly the whole of the floor space of the house. There are divisions in the box, so that four purifiers are really formed, each 60ft. by 30ft., and 5ft. deep. In the top are two covers to each purifier, made of 6in. by 3in. steel angles covered with steel plates ⅛in. thick. The inside of each purifier is fitted with 3in. by 3in. T-irons, on which rest wooden grids to carry the lime with which the gas is purified. There are four layers of these grids, and the lime is laid on them to the thickness of about 6in., through which the gas is made to pass. The joints between the covers and the purifiers are formed of india-rubber—so as to make the boxes perfectly gas-tight—in lieu of the old-fashioned water "lutes" which are more commonly used. The purifiers are carried on a raised floor formed of steel girders, supported by cast-iron columns; the inlet and outlet pipes are of 18in. diameter, and the flow of gas is controlled by a Weck's centre valve so arranged that the four purifiers can be worked either singly or together. The lime will be lifted from the basement by an elevator and conveyed to each purifier by a push-plate conveyor formed in the roof. Chutes are provided at four points of the conveyor, so as to distribute the lime as desired to any part of the purifiers, and the lime, when exhausted, is discharged through two discharging doors in the bottom of each purifier, and will ultimately be conveyed where desired by conveyors fixed below. This part of the plant is not yet erected. The whole of the elevating and conveying plant is worked by a 12-h.p. Crossley gas engine. The plant is the largest yet erected in the Eastern Counties, and the advantage of this is that the gas will become more completely purified, because it passes through the lime more slowly, and a longer period is allowed for the chemical action to take place, by which the gas is entirely freed of its impurities. The purifiers were supplied and put down by Messrs. C. and W. Walker, Limited, of Donnington, Shropshire.

New Patents.

The following abridged description is specially drawn up for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

6670. Portable Buildings.—Patentee: C. H. Leonard, of Grand Rapids, Michigan, U.S.A. Tubular uprights pass through foundation beams or sills, and are secured by nuts under the sills. Studs of T-shape are secured to the upper ends of the uprights and are adapted to pass through slots in the tubular rafters. The uprights and rafters are fastened together by turning the former through a right angle after the heads of the studs have been inserted through the slots. Forked castings fixed in the upper ends of the rafters are adapted to interlock with one another and the ridge pole. Panels, preferably of wood, are grooved at the edges so as to enclose the uprights and rafters and show a continuous panelled surface, both inside and outside. Adjacent panels are secured together by a cam-shaped fastening, which is pivoted to one panel and fits over a screw driven into the other panel. On pushing the fastening down, the panels are drawn together, and on lifting it until a notch or recess comes opposite to the screw the panels can be separated. Roofing sheets of the same width as the panels are secured by metal covering strips, formed with keyhole slots. These strips are fastened by pressing the slotted parts over screws fixed to the rafters and sliding them downwards until the narrow parts of the slots come under the screw heads.

6169. Chimney and Ventilating Shaft Tops.—Patentee: M. T. Lander, of Ashbrook Road, Upper Holloway, London, N. Wind inlets are left at two levels in the built-up chimney, and at the lower level a short pipe on a plate is set in the throughway so as to leave an annular space for the air currents, while from the upper level a cap is suspended above the short pipe to prevent down draught.

7802. Opening and Closing Skylights. Patentee: D. Weir, of Dowanhill Street, Partick, Glasgow. A bracket carries a hand-wheel and bevel gear for rotating a screw on which is a crosshead nut connected by links with the hinged skylight. On rotating the wheel either by handle or rope the skylight is opened or closed. Worm gearing may be substituted for bevel gearing.

1758. Fireproof Roofs and Floors.—Patentee: H. K. Bromhead, St. Vincent Street, Glasgow. Iron or steel joists, about 4in. deep, are placed about 18in. apart, and the spaces between filled in with blocks. The under surface is plastered, and the upper surface is covered with asphalt, cement, or other material.

1753. Baths, Lavatory Basins.—Patentee: J. Gourlay, West Campbell Street, Glasgow. The lavatory basin is fixed near the end of the bath, so that the handles of the supply cocks and discharge valve can be fixed in the bracket supporting the basin. The discharge pipe of the basin may pass either to the bath trap or to a separate trap. The back of the basin is fitted with a mirror. A hollow rib in the basin acts as an overflow passage.

6488. Ceilings, Walls, Slabs.—Patentee: G. Geppert, Nicolaistrasse, Breslau, Germany. Interlocking slabs for ceilings, walls, pipes, &c., are made with central grooves twice the width of the side ribs, and are arranged to break joint. In the construction of ceilings, the lower slabs rest with their plain faces undermost on the flanges of I-shaped bars, supported by the joists, and the upper slabs have their plain surfaces turned upwards. Halves and quarters of slabs are fitted in at the sides and ends of the joists, and the slabs are united by mortar to form a watertight ceiling. The inner edges of the ribs may by undercut, bevelled, rounded, or chamfered.

1966. Windows.—Patentee: J. Gammie, Thistle Lane, Thistle Street, Aberdeen. The lower portions of the pulley stiles with the parting and inner beads are made detachable, to facilitate the removal of the sashes from the frame for the purpose of cleaning the outside of the glass, &c. The movable parts of the stiles are secured to the fixed parts or to the sash stiles by pivoted or spring catches which enter recesses in the stiles. The illustrations accompanying the specification show a method of securing the sash cords or chains to the sash stiles, so as to allow the sash to turn when it is removed from the frame. The end of the cord is threaded through a hole in a tube or thimble, which is made large enough to receive the knot, and is arranged to slide in a socket in the centre of the sash stile. A flange at the end of the thimble limits the motion of the thimble within the socket.

Property and Land Sales.

FREEHOLD BUILDING ESTATE, fronting on main road and close to golf links and Highgate Woods, seven minutes' walk from Muswell Hill and East Finchley stations. To be LET on lease or SOLD in plots. Liberal advances to responsible builders if required. For plans and particulars, apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington-road, N. 1

Kensington, three minutes from High-street Station.
Half an acre of Freehold Building Land.
Free from restrictions.

Very important and exceptionally extensive Freehold Property, close to the High-street, possessing unequalled facilities for profitable development by the erection of residential flats or other premises.

By order of the Trustees of the Kensington Grammar School foundation.

WEATHERALL and GREEN will SELL by AUCTION, at the MART, City, on MONDAY, November 6th, at Two o'clock, the valuable FREEHOLD PROPERTY, comprising the residences, Nos. 25, 26, 27, 28, and 29, Kensington-square, and the premises and ground in the rear, formerly occupied by the Grammar School, possessing a frontage of 116ft. to the square, and a total superficial area of about 20,650ft., nearly half an acre, and offering exceptional facilities and a splendid opportunity for development in the heart of the Royal Borough, and with the proximate benefit of the local improvement shortly to be effected. The property is sold absolutely free from any restriction as to development, and early possession may be obtained of the larger area, the tenancies being yearly.

REUBEN C. GREEN, Esq., Solicitor to the Trustees, Vestry Hall, Kensington. Particulars and plans of WEATHERALL and GREEN, Auctioneers and Surveyors, 22, Chancery-lane 1

Northfleet, Kent.

To Land Speculators, Building Societies, and others. Sixty-eight acres of Freehold Building Land, between Northfleet and Gravesend, in close proximity to a large industrial district, where there is an increasing demand for small-class houses.

WEATHERALL and GREEN will SELL by AUCTION, on MONDAY, NOVEMBER 6th, 1899, at TWO o'clock precisely, the FREEHOLD BUILDING ESTATE known as Brook-vale, situate within a short distance of the recreation ground, railway stations, and tramway route to Gravesend, containing 68½ acres, and possessing 12,000ft. of frontage on the road from Northfleet to Southfleet, in which the mains of the water company are laid, thus facilitating the formation of subsidiary roads for its development.

Solicitors, Messrs. Sayer and Colt, 33, Havelock-road, Hastings.

Particulars, plans, and conditions of sale of the AUCTIONEERS, 22, Chancery-lane. 1

In the City of London.

Most important BUILDING SITE, situate on the east side of Finsbury-pavement, nearly opposite Moorgate-street Station and the Station now being erected on the City and South London Electric Railway. The site is covered with the houses numbered 42, 44, 46, 48, 50, and 52, Finsbury-pavement, and 1A and 2, South-place.

The site has a frontage of 166ft. to Finsbury-pavement, another frontage to South-place of 109ft., and it is bounded in the rear or east side by a paved yard, to which it has frontage and cart access. The superficial area is 16,750ft., and the entire site can be utilised, as it is exceptionally free from rights of light appertaining to adjacent properties, and it is admirably suited either for shops with offices over, or for banks, insurance offices, or public companies.

The above will be LET by AUCTION by

DANIEL WATNEY and SONS, by direction of the Fishmongers' Company, Governors of Holt School, and with the approval of the Charity Commissioners, at the Mart, Tokenhouse-yard, E.C., on THURSDAY, NOVEMBER 2nd, 1899, at TWO o'clock precisely.

Particulars, with plan and conditions of letting, may be had either of Mr. J. WRENCH TOWSE, Fishmongers' Hall, London Bridge; Mr. C. O. HUMPHREYS, Giltspur-chambers, Holborn-viaduct; Mr. HOWARD CHATFEILD CLARKE, the Company's Surveyor, 63, Bishopsgate-street-within; and of the Auctioneers, Messrs. DANIEL WATNEY and SONS, 33, Poultry, E.C. 1

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," "Malabar," New Eltham, S.E. 7

TRACINGS and Photo Copies made; Photo Papers supplied; work called for on receipt of post card.—G. QUINLAN, 47, New-road, Wandsworth-road, S.W. 2

RECOVERY of TRADE DEBTS in the Metropolitan District for Builders' Material Merchants and Manufacturers is undertaken on special terms, and punctual attention given to all cases.—Address, in first instance, Box 1211, Office of "THE BUILDERS' JOURNAL." 6

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

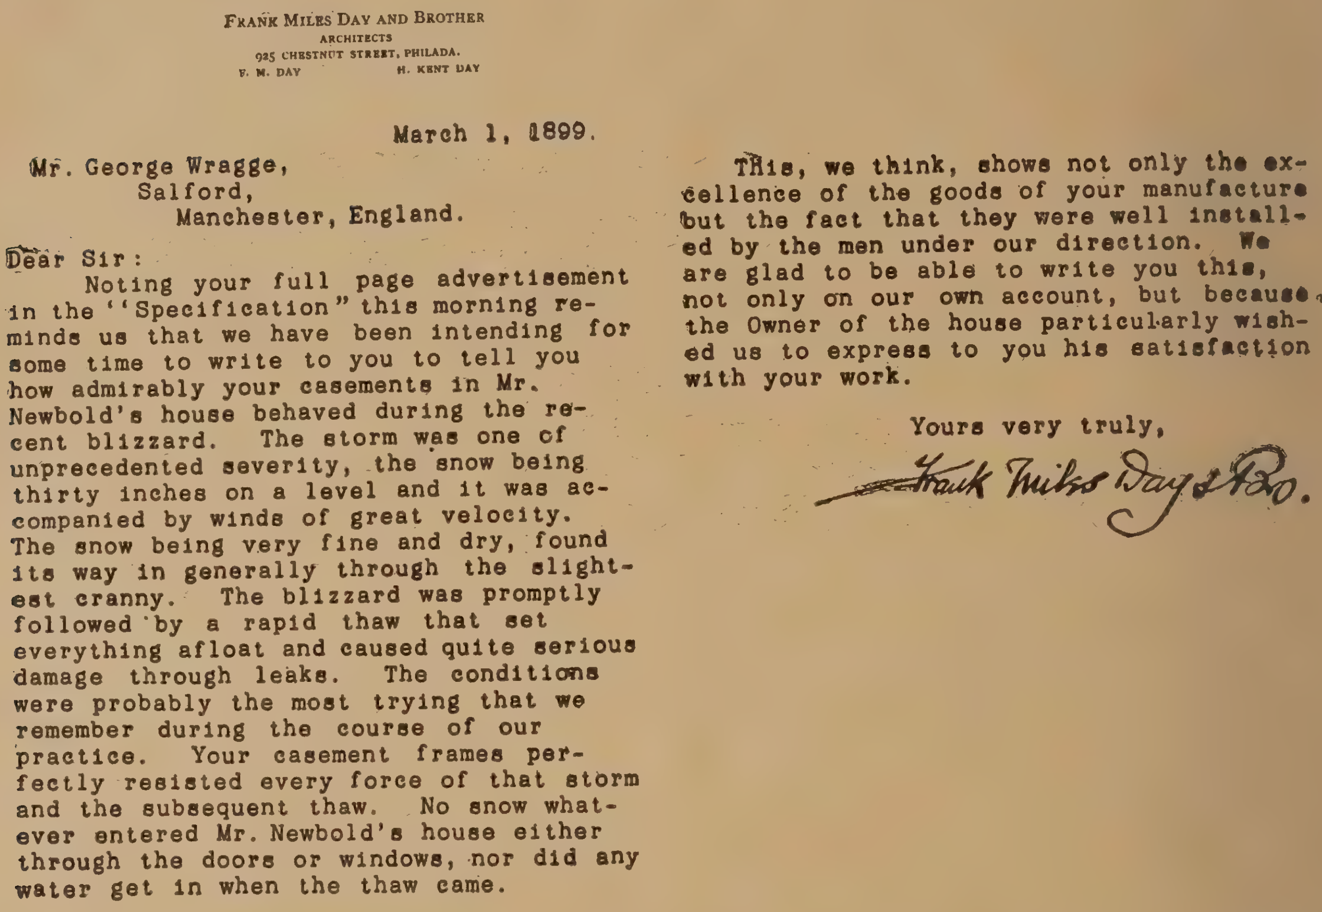
COPY OF TESTIMONIAL. (Unsolicited).



FRANK MILES DAY AND BROTHER
ARCHITECTS
925 CHESTNUT STREET, PHILADA.
F. M. DAY H. KENT DAY

March 1, 1899.

Mr. George Wragge,
Salford,
Manchester, England.

Dear Sir:

Noting your full page advertisement in the "Specification" this morning reminds us that we have been intending for some time to write to you to tell you how admirably your casements in Mr. Newbold's house behaved during the recent blizzard. The storm was one of unprecedented severity, the snow being thirty inches on a level and it was accompanied by winds of great velocity. The snow being very fine and dry, found its way in generally through the slightest cranny. The blizzard was promptly followed by a rapid thaw that set everything afloat and caused quite serious damage through leaks. The conditions were probably the most trying that we remember during the course of our practice. Your casement frames perfectly resisted every force of that storm and the subsequent thaw. No snow whatever entered Mr. Newbold's house either through the doors or windows, nor did any water get in when the thaw came.

This, we think, shows not only the excellence of the goods of your manufacture but the fact that they were well installed by the men under our direction. We are glad to be able to write you this, not only on our own account, but because the Owner of the house particularly wished us to express to you his satisfaction with your work.

Yours very truly,

Frank Miles Day & Bro.

The above *UNSOLICITED* Testimonial refers to a very important order for upwards of 250 BRONZE CASEMENTS supplied to Mr. Newbold's Mansion, Philada. U.S.A. The sections used were Nos. 20, 22 and 24, illustrated in our NEW CATALOGUE, pages Nos. 10, 14 and 18 respectively.

Glasgow, 12th October, 1899.

Contractor to War Office, Admiralty, and Board of Works, writes:

"Our City Engineer having shown me a copy of 'Specification,' I would be glad to have one for my office, and herewith enclose Postal Order."
Cork, 10th October, 1899.

PRESS OPINIONS.

"The Engineer" says of No. 4:

"The field embraced by this issue appears to grow with each half-yearly issue. No. 4 contains over 700 pages, and we note that the compilers are alive to the necessity of collecting together in separate divisions all information, although not quite of a kindred nature, yet likely to be sought for by men of a particular profession. For instance, 'Hygienic Engineer,' 'Roadmaker,' and a new miscellaneous section have been incorporated into one division, entitled 'Municipal Engineer.' We note, too, that prices have been introduced into most of the sections, and, we are informed, are being rapidly prepared for the others. In the 'Engineer' section all the papers are new, and contain articles on 'American Steel Construction,' 'Design of Underground Conveniences,' 'Lime Kilns,' 'Granite Paving,' &c. There is also an article on 'Engineers' Prices.' The labour involved in the production of such a publication must be immense, and it is to be hoped that it will meet with a commensurate reward."

"Electricity" says:

"SPECIFICATION No. 4 maintains its reputation as an architects' and engineers' compendium. The present issue has been corrected and brought up to date, and yet further enlarged. The various sections have been written by men whose names are a guarantee for their thoroughness."

Special Offer.

TO THOSE who have not yet purchased this colossal work we make this offer. Anyone purchasing from this office a copy of "SPECIFICATION" No. 4 who is dissatisfied with it can return same within 3 days from date of purchase, and the money will be refunded, provided that the copy is in the same condition as when purchased.

REDUCED *FAC-SIMILE* PAGE OF SPECIFICATION CLAUSES.

Continuation of **Specification.** *Concretor.*

WORKMANSHIP.

GENERALLY.

24. Proportions. Proper boxes or measures must be provided for accurately measuring the proportions of the various materials for the concrete. Such proportions to be ascertained by actual measurement at each mixing.

25. Mixing. The materials for the concrete are to be mixed by first filling a cubic yard or other suitable measure with the aggregate, then adding the cement (which must be separately measured). The whole to be twice turned over dry, then shovelled into a third heap, at the same time adding from the rose of a watering-pot sufficient water only to make the ingredients cling together. The materials to be again turned over in a wet condition before being removed and deposited in position. All necessary precautions must be taken to prevent the cement being blown away during the mixing.

26. Porous materials to be wetted. The whole of the coke breeze, broken brick, stone, or other porous aggregate to be well wetted with water before mixing, turned over, and allowed to drain, so that the surfaces may be damp, but not wet, when required for use.

27. Concrete to be freshly made. The concrete is to be mixed in convenient quantities to suit the requirements of the work. The chopping up and use of concrete or cement which has begun to set will not be permitted.

28. Levelling. All concrete when deposited in position is to be carefully levelled or laid to falls as may be required, and brought to an even and finished state.

29. Setting. Every care must be taken not to disturb the concrete whilst setting. In all cases where it is found absolutely necessary to pass over newly formed concrete, planks are to be carefully laid down.

30. Work prohibited during frosty weather. No concrete work shall be executed during frosty weather, nor even if there shall be any probability of a frost occurring before the concrete has had sufficient time to set.

FOUNDATIONS.

31. Concrete in Trenches. The concrete to be lowered into the trenches and not thrown in. After the concrete has been deposited in position it is to be well worked against the sides of the trenches by means of a spade or trowel, lightly rammed with wooden beaters, properly levelled, and brought to an even surface.

32. Building on Concrete. An interval of seven days (or such other period as may be directed) is to elapse between the completion of the concrete foundations and the commencement of any building upon them.

UNDER BOARDED FLOORS.

33. Laying. The concrete to be 6in. in thickness, lightly rammed with wooden beaters until the moisture rises to the surface, floated to a smooth and even face and finished to proper falls or levels.

UNDER TILE OR OTHER PAVEMENTS.

See Clause 33.

PAVING.

34. Laying. The concrete paving to be 6in. in thickness, finished with a granite surface, and smoothly floated to proper falls or levels.

35. Granite Surface. The surface of the concrete paving to be formed with a layer of granite concrete 1in. in thickness, lightly rammed with wooden beaters and floated to a perfectly smooth and even face. The entire thickness of the paving to be laid and finished in one operation.

36. Expansion Boards. Provide and fix expansion boards or slips at intervals of every 12ft., including removing same at completion, filling up the cavity with concrete and making good the surface.

37. Watering Surfaces. The finished surface of the concrete to be kept damp for at least seven days (or fourteen days) after being laid, by covering with wet sand or sawdust. The sand or sawdust to be kept moist during the period named by frequently sprinkling it with water from the rose of a watering-pot.

38. Protection. The concrete surfaces to be properly protected from any injury that might be caused by passing traffic, falling materials, etc.

39. Freedom from Discolouration. The surface of the concrete paving to be of uniform colour throughout, and free from any stain, discolouration, or other defect.

40. Surface Channels. Surface channels, having a shallow curved section, to be formed in the concrete paving where shown on the drawings. To be laid to proper falls, and neatly dished round the top of each gully

UPPER FLOORS.

41. Laying. The concrete to be hoisted to the required height, and carefully filled in between the rolled steel (or iron) joists to a depth of 9in. (or other specified thickness), lightly rammed with wooden beaters, and levelled and floated to an even surface. Each concrete floor is to be laid and completed at one operation, the necessary arrangements being previously made for carrying on the work without cessation.

42. Watering Surfaces. *See* Clause 37.

43. Sheeting. Provide and fix proper deal rough (or wrought) flat sheeting, with flush joints, including all necessary supports and strutting that may be required, and remove at completion.

43a. Alternative Clause. Provide and fix proper deal rough (or wrought) sheeting on proper centres or turning pieces, and of the curvature shown on the drawings. To include all necessary supports and strutting that may be required, and remove at completion.

44. Removal of Sheeting. The sheeting, &c., is not to be disturbed for a period of at least fourteen days after the concrete has been laid (or such other period as may be considered necessary), and it shall not be removed without first obtaining the sanction of the architect (or engineer) in writing.

45. Sheeting to be Wetted. The upper surface of the sheeting to be well wetted from the rose of a watering-pot before depositing the concrete upon it

WALLS, PARTITIONS, STANCHIONS, Etc.

40. Depositing. The concrete to be carefully deposited in position, and lightly rammed between the casing and around the iron or other cores as shown on the detail drawings.

47. Girders and Stanchions. All projecting girders and stanchions to be similarly encased with concrete where required.

48. Casings. Provide and fix proper deal casings with flush points, including all necessary timbering and strutting, and remove at completion.

48a. Moulds. Provide and fix proper moulds to all bull-nosed angles, reveals for door frames, chases, and recesses where shown on detail drawings, and remove at completion.

49. Removal of casings. The casings and moulds shall not be removed until the concrete has thoroughly set.

LINTELS.

50. Moulded Work. - The concrete for lintels to be filled into properly constructed moulds or boxes and well worked around the iron or other cores as shown on the detail drawings. The lintels to be made 18in. longer than the opening over which they are to be fixed, so that they may rest 9in. on the wall at each end. To be 9in. in depth for all spans not exceeding 4ft., and 12in. in depth for all spans exceeding 4ft. and not exceeding 6ft.

51. Cores to be Embedded. All lintels having a bed or width not exceeding 9in. to have a core consisting of a 3in. × 3in. rolled steel (or iron) joist weighing 10lb. per foot run properly embedded in the same. An additional joist to be added for every additional 9in. in width or bed of lintel.

52. Seasoning. The concrete lintels to be left in the moulds until properly set, and to be made at least six weeks before being required for building into position.

53. Moulds. Provide all necessary moulds, casings, and patterns that may be required for the proper construction of the concrete lintels as shown on the detail drawings

BRICKS.

54. Fixing Blocks. Breeze bricks to be built into the walls where shown on drawings or otherwise directed for the proper fixing of joinery, etc. The concrete to be filled into suitable moulds and allowed sufficient time to set and harden before being used.

SEA AND RETAINING WALLS.

55. Concrete to be carried up uniformly. - The concrete to be carried up uniformly over the whole area embraced in each section under construction, no part to be more than 3ft. higher than another. To be laid in horizontal courses not exceeding 18in. deep.

OVER 3000 MODEL SPECIFICATION CLAUSES.

Supplement to the Builders' Journal and Architectural Record, *October 18th*, 1899.

REASONS

Why you should purchase the 4th Number of Specification.

1.—It is the only book that covers the wide field of Modern Constructional Work.

2.—It contains 3,000 Specification Clauses, Builders' Prices, Building Act Regulations, a Directory, Articles on Planning and Designing, over 20,000 Experience Notes, with an Index to the whole.

3.—It is always ready for reference. If you wish to decide the best way to design a piece of work, the notes in Forty-four Sections are ready to assist you. In writing your Specification, Model Clauses are provided to save you time and thought. In the Building Act Clauses you will find all the regulations affecting your design, and with the help of the Prices you can easily get out your estimate.

4.—It is not the work of one man. Over 120 Skilled and Expert Contributors have assisted in its Compilation, contributing to those Trade Sections in which their expert knowledge is admitted. Accuracy and authoritativeness are thus gained, and the risk of errors of judgment or prejudice, which might be possible in one man's work, are avoided.

5.—In addition to its comprehensiveness, authority, and accuracy, it has the additional advantage of being the most inexpensive work of reference offered to the public. At the published price of **5/-** it is "A Marvel of Cheapness."

6.—It will save you hundreds of hours in your professional or business capacity.

Why you should not purchase the 4th Number of Specification.

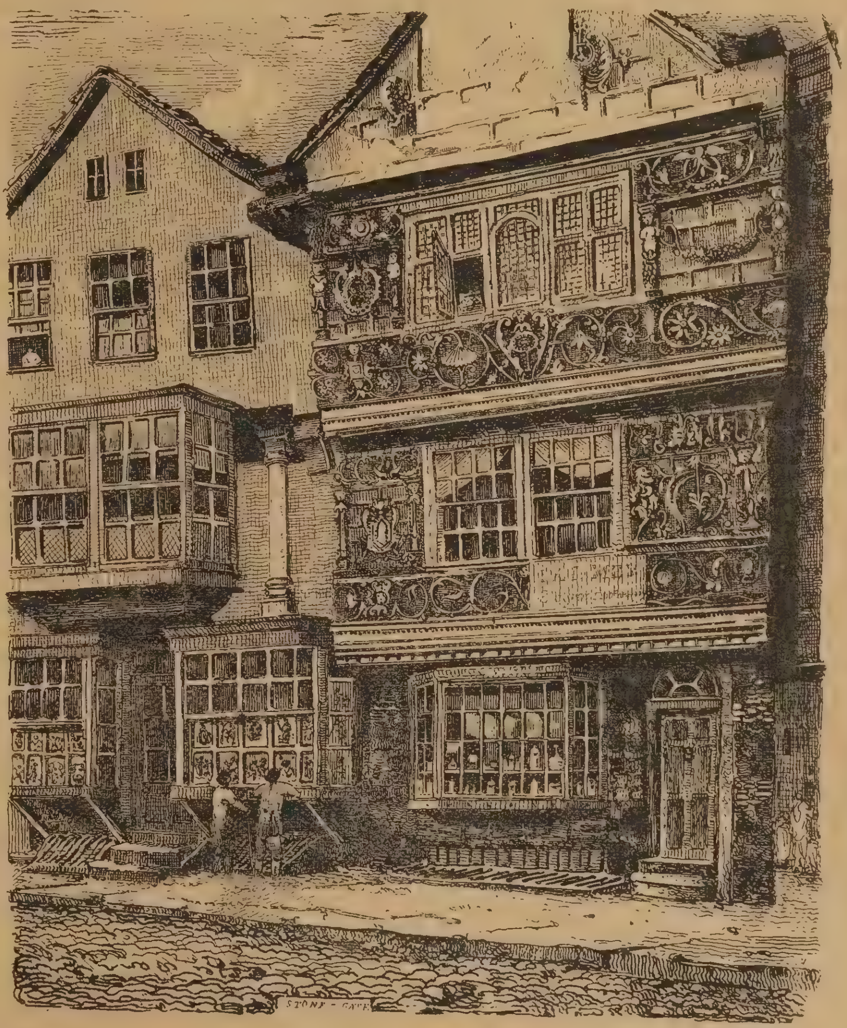
An Architectural Causerie.

Memorial Columns. The great memorial columns of the world are not very numerous. The two most celebrated ones still standing are in Rome; they are those of Trajan and Marcus Aurelius; each is of the Doric order, and stands in a comparatively confined space, gaining in apparent height and size in consequence. It is in accordance with what may be called the modern traditions of Rome that the figures of the two emperors have been replaced by those of St. Peter and St. Paul. Conspicuous in Paris is the column in the Place Vendome, built after the Roman model, Doric, and covered with spiral plaques of gunmetal representing the campaign of 1805, made from captured guns. The "Place" itself is remarkable as being one of the earliest attempts to build a number of residences in blocks, the whole resembling one or more single structures, a system destined to spread all over Europe. The column, of July commemorates the Revolution of 1830, and stands on the site of the Bastille, a black pillar with Corinthian capital, surmounted by a golden Mercury springing from a globe; it is placed so as to be visible down several streets, a conspicuous and handsome object at the end of the vista of each. London possesses one ancient and three modern columns; the oldest and finest is the monument, designed by Wren to commemorate the destruction of the capital in 1666; it is a stately pillar of beautiful outline, appropriately surmounted by a ball "enriched" with flaming copper rays. It is seen to great advantage by artificial light or moonlight; then with the Palladian building beside it, there is a certain Roman atmosphere about the picture. It stands on Fish Street Hill, and the name reminds us of the changed level of modern London, which has so altered and injured the view of this and other works of Wren. The "Hill," was then distinctly visible, and the whole of the long ridge from Tower Hill to St. Paul's upon which Old London was built; now, following the universal law, the growth of the town has been accompanied by a process of "levelling up," and a great number of buildings are less conspicuous than formerly.

In the West End the Nelson Column is graceful and dignified, with its Corinthian capital and carved abacus supporting the figure of the admiral, its pedestals with bas-reliefs and Landseer's lions. The Duke of York's column is uninteresting, but splendidly placed in an opening over a wide stone staircase with a glimpse of the park beyond. A very delicate and graceful work is the small column opposite Dean's Yard, to the memory of the Westminster scholars killed in the Crimea; it admirably breaks up and enlivens a rather arid space. J. C. P.

Sketching Old Buildings. Many of us have no doubt spent a good deal of time in sketching old buildings; but I wonder whether any have felt, as the writer does, a certain hesitation as to how these old buildings ought to be studied. Take, as an example, a town like Norwich, with its cathedral and castle, its churches and old houses. Here surely, if we know how to study them, are many works of which a knowledge should help us in our own art. Yet when you come to look at the buildings it is difficult to know where to begin. You will hardly make a perspective sketch of the whole cathedral, whether from the outside or inside, as you feel that you are not very likely to have a cathedral to build, so that the little knowledge you might gain would not be of much use to you. Neither can you measure the whole church; that would be too long a job, and would not teach you anything very much more useful. So you decide not to grapple with the building at large, but to look out for some smaller detail; you think of making a sketch of the south door (though you feel a certain repugnance at that owing to your conviction that every architect who has ever visited Norwich has done the same thing) or of the lectern; or you go out into the cloisters and decide to measure one of the windows; or you go right out into the close and begin to sketch a canon's house, dating from the reign of Anne or George; or perhaps you give up the cathedral altogether and go to St. Peter Mancroft as being more like a modern parish church. There are several smaller things to sketch, more full of detail; the roof, the tower, or the wooden bapistery. The general result would be that the sketcher would leave a town like Norwich with only a few scraps in his sketch-book, little corners, details, picturesque bits—rather a meagre harvest where mediæval builders have raised so rich a crop. Of the plan of the church and the circumstances which ruled it, of the arrangement of the monastery, of the town and the way it was fortified he will know little or nothing. It may be that in the next church he has to design he will find his drawing of the lectern or the baptistery useful, but he will not know a great deal more of mediæval buildings than before his visit. E. B. S. S.



External "Pargetry" on old house in Stone Gate, York (now pulled down).
(From an old engraving.)

Architecture in the Novel: "Zola's Vision of the New Jerusalem." It is interesting to compare the writings of novelists like Hardy or Huysman with some of Zola's. Hardy gives us as a background to his story the human rather than the religious side of the Middle Ages. In Huysman, the religion of mediæval life is the source of its architecture. He would have us feel that these stone structures of the middle centuries, are not merely the outcome of material necessities, but raised as monuments of man's thoughts about God and the universe. Each of these novelists approaches the architecture of the past in a reverent and loving fashion, but with a difference; the one in the religious and the other in the more human mood. Zola, less an artist but greater as a man, deals almost entirely with the present and the future. All the ugly aspects of modern life are unflinchingly portrayed in his books with a brutal energy that is the outcome of sincerity and a desire for truth, and the bedrock of life, at all costs. It is astonishing therefore to find that this resolute facing of life as he sees it, in all its most hideous aspects, has strengthened rather than decreased his belief that life is desirable, that we should run to meet it, to embrace it, and not sit in retirement bewailing, like the German philospher, "the vanity of existence," or, like Ecclesiastes, cry out, "Behold! all is vanity and vexation of spirit and there is no profit under the sun." Zola sweeps all this kind of thing on one side, and in some of his prophetic moments gives us a vision of what he hopes for. A vision as it were of the New Jerusalem and of the new cities to come. Here is an extract from the last page or two of his novel, "Paris:"

"Marie raised a light cry of admiration as she pointed towards the city. 'Look! Look!' she exclaimed, 'Paris is all golden, covered with a harvest of gold!' They all re-echoed her admiration, for the effect was really one of extraordinary magnificence. The declining sun was once more veiling the immensity of Paris with golden dust.

"But this was no longer the city of the sower, a chaos of roofs and edifices suggesting brown land turned up by some huge plough, whilst the sun rays streamed over it like golden seed, falling upon every side. Nor was it the city where divisions had one day seemed so plain to Pierre: Eastward, the districts of toil, misty with the grey smoke of factories; southward, the districts of study, serene and quiet; westward, the districts of wealth, bright and open; and in the centre, the districts of trade with dark and busy streets. It now seemed as if one and the same crop had sprung up on every side, imparting harmony to everything, and making the entire expanse one sole, boundless field, rich with the same fruitfulness. There was corn, corn everywhere, an infinity of corn, where golden wave rolled from one end of the horizon to the other. Yes, the declining sun steeped all Paris in equal splendour, and it was truly the crop, the harvest, after the sowing. 'Look! just look!' repeated Marie, 'there is not a nook without its sheaf wherever one may turn. It is as if there were now but one and the same soil, reconciled and fraternal. Ah! Jean, my little Jean, look! see how beautiful it is.'

"Then Marie, with a fine gesture of enthusiasm, stretched out her arms and raised her child aloft, as if offering it in gift to the huge city. 'See, Jean! see, little one,' she cried, 'It's you who'll reap it all, who'll store the whole crop in the barn!'"

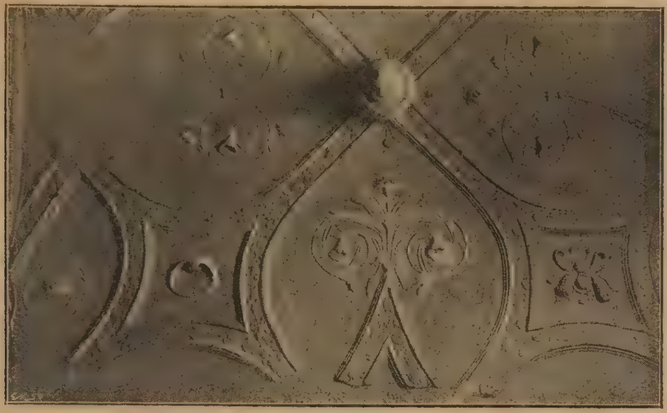
G. Ll. M.

On Reflection.

A Golden Opportunity. To anyone at all familiar with the Thames Embankment it must be glaringly apparent how little it is used by the citizens of London. This should not be so, for it has possibilities of forming a splendid promenade, one which would compare well with any of the famous boulevards of the Continent. The idea of forming the Embankment took practical form as far back as 1860, as the outcome of the widespread aversion from the offensive mud banks and unsightly buildings, though even now we possess a fine collection of the latter on the south side of the river. A Select Committee of the House of Commons deliberated on the matter, and a Royal Commission deliberated still more, and the respectable sum of £1,156,981 was incurred as the cost of the work. Altogether, about four millions of money have been spent on the Embankment, and it is surely a pity that after all this expense the efforts should be so little appreciated. In any other country than our own such a grand promenade would become a chief attraction and beauty spot; and though such a result entails certain objections, on the whole it would be a highly beneficial and satisfactory one. The river frontage is extensive, the width of the embankment is quite sufficient, and, as has already been stated, there are possibilities of effecting a great reform. The only persons who frequent the place in any numbers are the homeless and those who form part of the great criminal class of the city. With such a state of things existing, it is hardly fair to blame the public for not responding to the efforts which were made with the idea of benefiting them. It is those in authority who ought to make the initiative move. One correspondent has suggested that if artistically designed edifices, say of one or two storeys, were built, they would not interfere in any way with the existing buildings lining the Embankment, and would considerably add to the beauty of this unique site and make London the most fascinating city in the world. It has also been proposed that open-air cafés, band stands, &c., should be put up along the route, where the public could take recreation and enjoyment after the toils of the day.

Some Objections. There are, of course, certain objections to these suggestions, but in the main they sound the right note, that the old state of things should be swept away and a new and more attractive era inaugurated. At present the Embankment is badly lighted, a feature which is not usually calculated to add to the interest of a place, and this should be remedied —in fact, the idea has already been exploited, and it is to be hoped that very soon this much-needed reform will be a reality. Another objectionable feature is the roadway. This has never been satisfactory, and probably never will be, until wood blocks have been put down. At present (despite the great sums that have been spent in trying to improve it) the road gets into a puddle after heavy rains, and anyone wishing to cross has to wade through inches of mud. Then there are the unsightly riverside stations for the steamboats, and, in the centre of the Embankment, that most objectionable ventilator of the underground railway. Of all the London evils that want remedying this one of the railway ventilators should, and must claim immediate attention. The air of the city is polluted enough now and does not need additional dirt and obnoxious gases to be added to it from this source. Matters, therefore, are generally unsatisfactory, and the sooner something is done to make the Embankment more attractive than it is at present, the sooner will the public respond to the movement and be enabled to enjoy to the full the benefits which the site affords.

Japanese Craftsmen. Mr. Mortimer Menpes has made an innovation by importing a number of Japanese workmen to decorate his house in Cadogan Square—the first time, we believe, that such a thing has been done in London. Japan as an art nation holds a high place, and it is not too much to say that no nation in ancient or modern times has been richer in art *motifs* and original types than the Japanese. They have especially appreciated and adopted the system of adapting nature to requirements and conventionalising a natural object to render it better suited to their purpose. It has been asserted that the palmy days of Japanese art are past and gone, and that a period of decadence has set in; yet the spirit and motives of the old Japanese designers have not yet died out of their successors, who can still produce work of the highest quality. The Japanese artist aims at symmetry, but does so in a manner different from ourselves. He does not wish parts of his design to be matched or oppositely repeated, but rather seeks a general balance of parts not numerically even, not alike, but possessing those qualities of freedom and variety which give such a charming effect to the resultant work. British workmen, even of the very best class, are not equal to the task of dealing with Japanese designs in a thorough and efficient manner, and it would be idle therefore to blame Mr. Menpes for engaging craftsmen who can carry out his requirements. There is one matter which, however, requires consideration—that refers to the wages of the Japanese workmen employed. These have been at work for about a year, but they will return with only a few pounds in their pockets. They lived on a few pence a day, and their diet, we are told, chiefly consisted of heads and tails of fish—one which the British artificer would, naturally, consider wholly insufficient. But they appear to have thiven and to have been happy enough. It is well to state that they were imported purely on account of their being able to produce Japanese work in a more skilled and artistic manner than our own countrymen, but it is to be hoped that this cheapness of labour will not tempt some speculating "art merchant" to import some more Japanese workmen from mercenary motives, and without any real desire for art's sake. If the ordinary builder or decorator had a chance of getting hold of such talent at so low a figure he would be more than human if he refused to take advantage of it. His doing so, however, would raise some very serious problems, and, on the whole, we have no wish to see a large immigration of Japanese workmen into this country.



CEILING: TREVELYAN HOTEL, BARNSTAPLE.

BRITISH PLASTERWORK, PAST AND FUTURE.*

By GEORGE P. BANKART.

(Continued from page 149, No. CCXLIV.)

THE pendentive system was gradually adopted, and outlived the radial tracery system from which it came, although the radial basis is often seen on pendants when no corresponding ribs are visible on the ceiling proper. An excellent and most beautiful example of the pendentive ceiling without radial ribs is to be seen in the ceiling of the "Fish Room" at Audley End, and this ceiling is probably one of the most beautiful of the early school of English craftsmen. The moulded radial ribs are replaced by flat strap work, which is beautifully modelled all over with foliage in low relief. Sometimes the radial ribs were replaced by modelled foliage, giving the effect of a Gothic diaper. These simpler ceilings were dependent, to a great extent, on a scheme of colouring and gilding, the plasterer and painter becoming one and the same thing in work and in person.

The pendentive system, in its turn, was, by degress, abandoned for a geometric arrangement of ribs, but this treatment was no longer limited to straight lines. The ceilings abounded with inter-lacing quatre-foils, squares, lozenges, circles, and flame-like forms, with armorial bearings, emblems, and personal devices—filling in the spaces between the ribs. Figures were seldom introduced in these forms, unless of an armorial character.

The size of the sub-divisions gradually expanded, until it became customary to divide the area of ceiling into four quarters, whatever the size of the room, the pattern occupying a quarter-space, which was then reversed, and that again doubled over to complete the whole ceiling. This system, once adapted, led to the gradual abandonment of the geometric system, and contorted and complicated arrangements of clever design, full of new ideas, playfulness, and vigour, covered the ceiling area.

In the earlier ceilings the ribs were plainly moulded, resembling groin ribs, but as the power of execution developed, flat surfaces were introduced, which were frequently treated with an impressed decoration run off a revolving stamp (as with a book-binder's tool), and afterwards worked up by hand. Bosses of higher relief were introduced at intervals, done from a wooden stamp. These flat ribs generally have their edges moulded, with bosses at their intersection, modelled by hand.

The "pargetry" work previously referred to, ollowing the partial abandonment of the stucco-duro, was used to decorate any part of the house naturally covered with that material, such as the ceilings, walls, chimney-breasts, and the wall space above the wainscot or tapestry. Externally, if the house were built of half-timber, the panels formed by the crossing of the timber framing were frequently stamped or modelled in some simple manner. If the walls were covered entirely with plaster they would in some cases be covered with some rough and vigorous design, as on the old house at Wyvenhoe, in Suffolk; or, perhaps, panels would be modelled in the gables between the windows. (See illustration on page 173). Or, again, some simple geometric pattern would be scratched on the surface of the plaster with a fan-like arrangement of pointed sticks, known as "stick work." (For illustration see next page).

In many instances wooden templates of various patterns were applied to the surface of the wet plaster round the windows and doorways, and the walls would then be dashed over with "rough-cast" or pebbles, the whole being afterwards lime washed by way of protection against inclement weather. This being done the templates were removed, leaving a sunk pattern with a smooth surface, which was frequently picked out in bright greens, yellows and other colours. For internal work again, plaster of Paris mixed with hair was often used, either stamped or cast, but not modelled, unless mixed with other materials.

In Queen Elizabeth's time the ceilings chiefly consisted of moulded ribs in geometrical patterns, with the spaces between enriched with sprays of flowers, and medallions of ornament worked in many ways. The ribs forming the main pattern were "cast" in a reverse mould, or "run" with a reverse template, in position, the flowers and medallions in the early days being nearly always modelled by hand. Afterwards, it was customary to stamp and then to cast them in plaster of Paris, even when the remainder of the ceiling was worked in position. The stamping, probably, may have been done in the following manner:—the design would be modelled in clay, and a mould would be taken from it in plaster and varnished with shellac or some similar material to stop suction; liquid plaster would be poured into the mould, and then applied to the ceiling, being held in position by a support from the scaffolding until sufficiently set to allow the mould to be removed; it would then be touched up where required with a small metal tool by hand. (See illustration on page 177). In later times the method was confined almost exclusively to casting in plaster of Paris from clay models and plaster moulds. This method was undoubtedly productive of beautiful results, but it cannot be regarded as so proper and desirable a method as modelling by hand *in situ*, or even by stamping and pressing the moist plaster. The method of "casting" was productive of a great softness of effect, combined with a certain dulness which may be looked upon as a virtue and natural quality of the material; but it had one great disadvantage, namely, the loss of intellectual work on the part of the craftsman by constant repetition of one idea by an increased amount of mechanical labour; nor could it be done *in situ*, as the best work admittedly was.

James I.'s reign was productive of much fine work, such as examples at Audley End, 1616; Aston Hall, 1620; Crewe Hall; Bramshill House, Littlecoats; Bickling Hall; Haddon Hall; Burleigh, and numerous other places.

At this period Scotland revelled in rich stucco work. There a system was common at one period in which leaves and fruit were cast in quantities, differing in size and variety, and being brought on to the scaffold in baskets assorted for use. The workman then drew his design on the ceiling, modelled the stems and branches by hand in position, stuck up the leaves and fruit where required, making good the connection afterwards. Of this variety of work, fine examples are to be seen at Kellie Castle, Holyrood Palace, and other places. Many of the ceilings at Holyrood Palace were worked by a company of "gentlemen" modellers, who were allowed to wear the sword and frills of the period. That these ceilings were worked entirely by hand in stucco is evident from the texture of the work itself, the irregularity of the mouldings, and the intricacy of the modelling. The

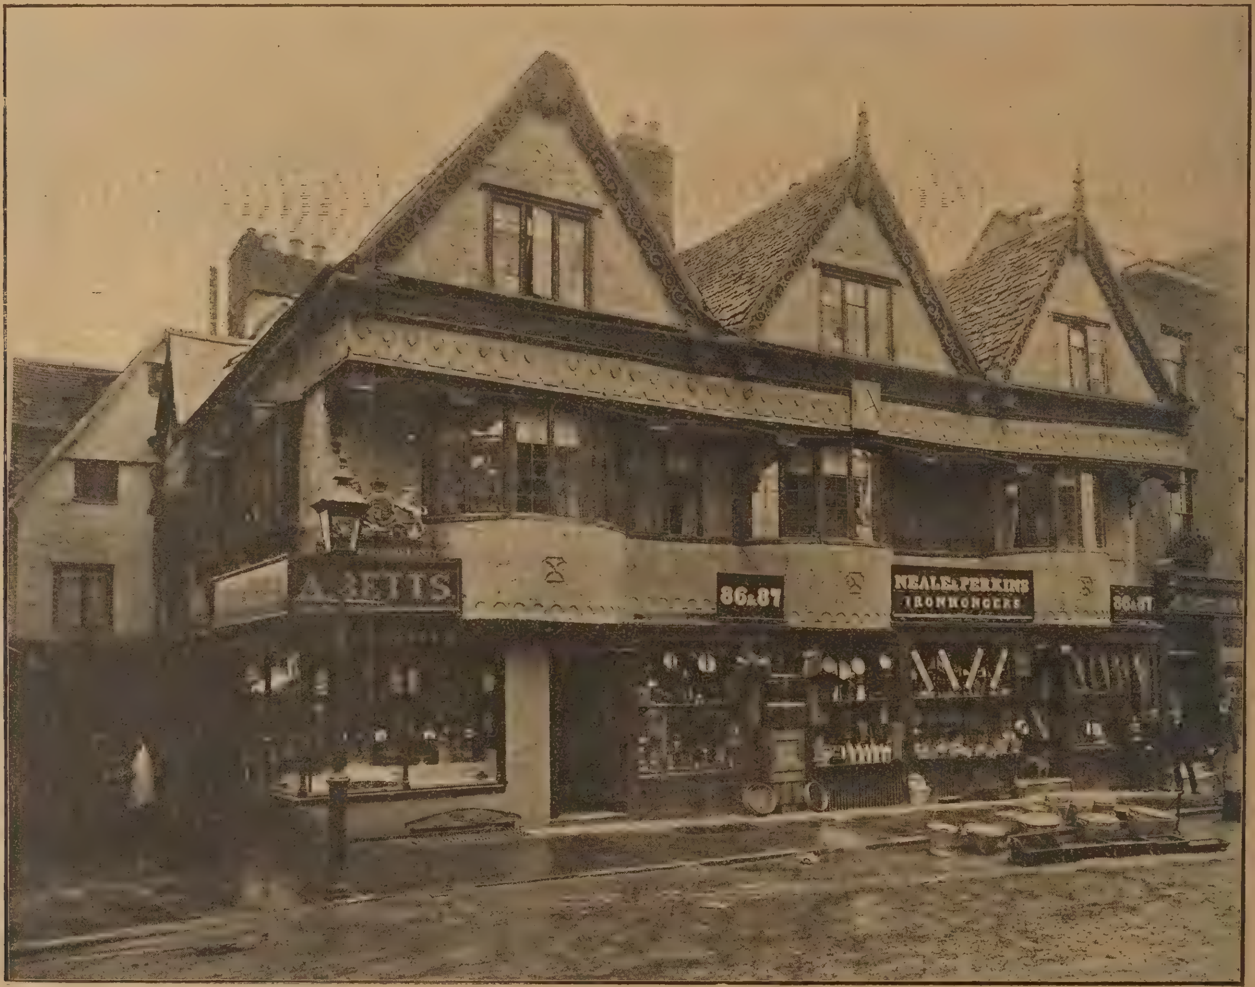
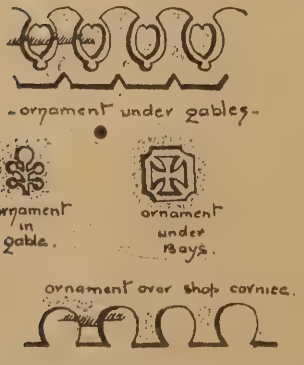
names of some of the workers are to be seen also upon close examination.

During the time of Charles I. the net-like arrangement of the ceilings became less used, greater prominence was given to the "compartment" under the influence of Inigo Jones, and the centres and smaller compartments were filled with exquisite low relief work, in which delicately modelled figures prevailed. That the stucco worker was not abolished by the troubles which followed is shown by the existence of "Sparrow House," Ipswich. Design again improved with the restoration, and the reigns of Charles II. and James II. produced work greatly influenced by the taste of Louis XIV. of France. In this work floral festoons played a large part in the decorative treatment, the modelling became wax-like in texture, too minute, but technically perfect—too perfect. Thus the general spirit of "design" as a whole became lost sight of, and attention was chiefly given to detail.



EXTERNAL "PARGETRY," BURFORD, OXFORDSHIRE.



ornament under gables.
ornament in gable.
ornament under Bays.
ornament over shop cornice.

About this period few Italian designers and stucco workers came into England, and the decorative plasterwork was chiefly done by Englishmen. Wren used his influence in refining the work, but in the French spirit.

(To be concluded.)

DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

By GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

(Continued from page 132, No. CCXLIII.)

IV.—PARTY STRUCTURES.

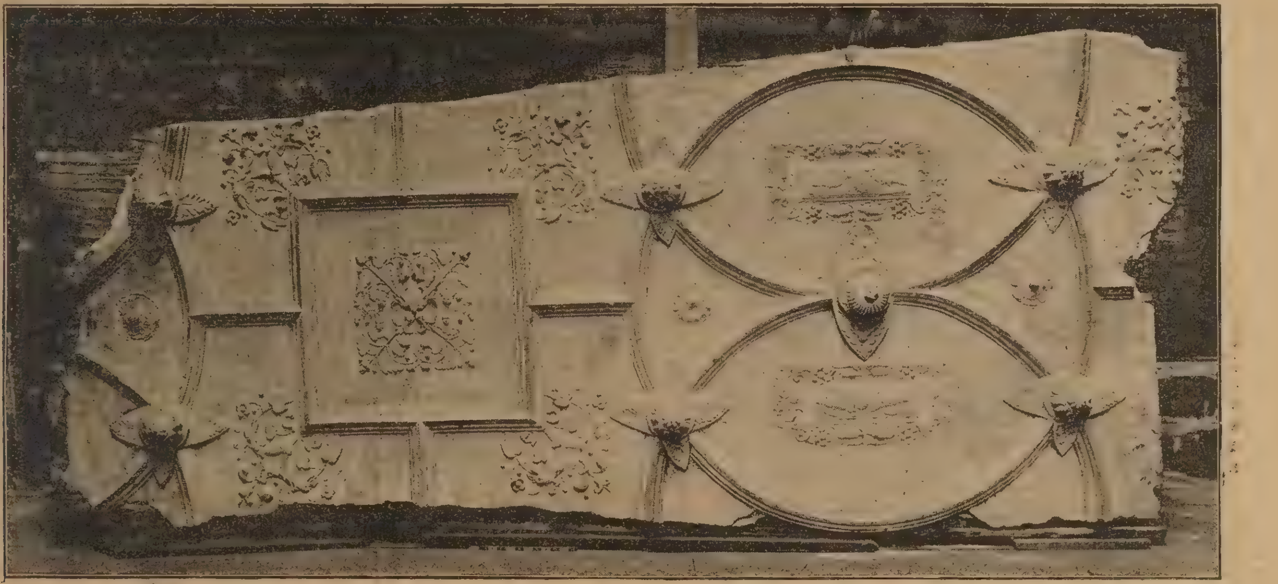
WHEN we read, under Section 74, that every building must be separated from any adjoining building "by an external wall or by a party wall or other proper party structure," we are naturally led to inquire what is a "proper party structure?" A party structure is defined, under Section 5 (20) to mean "a party wall, and also a partition, floor, or other structure, separating vertically or horizontally buildings, storeys, or rooms, approached by distinct staircases or separate entrances from without." I do not know any section in the Act that determines the nature of a party structure more particularly. Its thickness appears to be nowhere specified; and district surveyors are apparently left to use their own judgment as to whether it must be of fire-resisting materials or not. So far as my experience goes, district surveyors do not allow any vertical party division to be less than the minimum thickness of a party wall, namely 8½in., or say a 9in. wall of brick, stone, or concrete. In a case that came under my notice, a large shop was separated from the remainder of a building by brick walls and floors of iron and concrete. A 2in. wood framed partition was then erected, dividing the shop into two, which were to be let separately. The district surveyor objected to this as an irregular separation; but he withdrew his objection when a door was formed in the partition, because there was then no separation, although the door was always to be kept locked. In another case, an old building had long ago been divided by stud partitions on every floor, and each portion of the building had its separate entrance and staircase, and was separately occupied. Both occupiers agreed to let the whole of one of the upper floors to one tenant, and for this purpose they proposed to form a doorway in the stud partition on that floor. The district surveyor objected on the ground that there were two buildings in separate occupation, and they could not, under Section 77, be united. In vain was it urged that the stud partition was not a proper party structure; the surveyor insisted that it constituted a "physical separation," and that the proposed doorway was illegal.

External Walls Converted into Party Walls.

If a building owner allows his external wall to be built against by an adjoining owner, this converts it into a party wall. The adjoining owner then gains the space that would have been occupied by his own external wall, and practically acquires half the ground upon which the party wall stands. Such cases are familiar enough. But there is another way of converting an external wall into a party wall. One definition of a party wall under Section 5 (16) (*b*) is "a wall forming part of a building and standing to a greater extent than the projection of the footings on lands of different owners." In a case that came under my notice, a building owner had a 9in. external wall to an outbuilding one storey high, the footings on one side of the wall being on the adjoining owner's land. The building owner excavated to form a basement under the outbuilding, and underpinned his 9in. wall with a 14in. retaining wall. But, being desirous to economise in space, he brought the inner face of his 14in. wall flush with that of his 9in. wall, thus forming a set-off on the adjoining owner's side. The district surveyor then decided that the wall had become a party wall, because it stood at a greater extent than the projection of its footings on lands of different owners; and he required the building owner to raise his wall or lower his roof, so as to bring both into conformity with the provisions of Section 59.

A Party Wall Can Be a Separate Structure.

It appears that a party wall can be treated as a separate structure from either of the buildings which it divides. In the case of *Crow* v. *Redhouse*, a building had been burnt and taken down for more than half its cubical extent. Consequently, in re-erection, it came within the definition of a new building in Section 5 (6): "Any building which has been taken down for more than one-half of its cubical extent, and re-erected or commenced to be re-erected, wholly or partially, on the same site, &c." It was subject to all the rules of the Act applying to new buildings. The district surveyor claimed that the party wall should, like every portion of the building, be reconstructed in conformity with the provisions of the Act. On behalf of the builder, however, reference was made to Section 208: "Unless the Council otherwise allow, where a party wall or external wall not in conformity with this Act has been taken down, burnt, or destroyed, to the extent of one-half thereof (measured in superficial feet), every remaining portion of the old wall not in conformity with this Act shall either be made to conform therewith, or to be taken down before the rebuilding thereof." It was pointed out that the wall had not been destroyed to the extent of one-half, and it was contended that it need not be rebuilt in conformity with the Act. The court decided the case, on appeal, against the district surveyor, and allowed the old wall to remain. At the same time, it was admitted that the surveyor might have been within his rights if he had required only the new part of the wall to be rebuilt in conformity with the Act. The case of *Watson* v. *Macey and Sons* was somewhat similar, and confirmed the doctrine that a party wall may be treated as a separate structure, for the purpose of rebuilding.



PINDAR HOUSE.

Can a Wall be a Party Wall for only a Portion of its Height?

There is an impression among some architects that a wall between two separately occupied buildings of different heights is a party wall for only a portion of its height. I have heard it contended that such a wall is a party wall to a height of 15in. above the gutter or flat of the lower building (in buildings of the domestic class), and that above that height it can be an external wall with windows in it, provided that the owner of the lower building does not object. That this view is erroneous has been argued from Section 59 (1), which provides that every party wall shall be carried up (of thickness and height specified, according to the class of building) above the "roof, flat or gutter, of the highest building adjoining thereto." Against this plain argument, it is customary to cite the case of *Drury* v. *The Army and Navy Auxiliary Stores*, in which it is said to have been decided that a wall can be, for some part of its height, a party wall, and as to the remainder, an external wall. Let us see how far the decision in that case affects the interpretation of Section 59.

The Case of Drury v. The Army and Navy Auxiliary Stores.

This case was tried in the High Court on an appeal from a magistrate's decision. The building in question was of the warehouse class, containing some 650,000 cubic feet. Section 75 provides that (with certain exceptions which do not apply here) no building of the warehouse class shall extend to more than 250,000 cubic feet, unless divided by party walls in such manner that no division thereof extend to more than 250,000 cubic feet. The building had been divided in the manner required, and the dividing walls had been carried up as party walls to 3ft. above the roof of the first storey, in conformity with Section 59 (1). But a part of the building was more than one storey high; and here one of the dividing walls was carried up as an external wall to the upper storey, being pierced with windows above the said height of 3ft. from the lower roof. It was these windows to which the district surveyor had taken exception under Section 59; the magistrate had over-ruled his objection, and the magistrate's ruling was upheld on an appeal to the High Court.

The Decision of the Judges.

In delivering judgment Mr. Justice Wright quoted Section 75, and said:—"Obviously in that section the word 'party wall' is used, not in its technical sense, but merely as a convenient phrase for sub-dividing walls." Referring to the construction placed by the district surveyor upon Section 59, he said: "We need not absolutely decide that, because the point on which this case depends arises on Section 75. I think the real ground for our decision is that Section 75 has not the unnatural effect of making what is not a party wall into a party wall any higher than the point at which it ceases to be in point of fact a dividing wall." Mr. Justice Collins concurred in this decision, remarking that, but for Section 75, the wall in question would not be a party wall. He referred to the contention on behalf of the district surveyor, that the dividing walls of the warehouse were, by Section 75, constituted party walls, and therefore subject to all provisions relating to party walls; and he met this contention by quoting Section 5 (16) (*a*), which defines a party wall as separating adjoining buildings belonging to different owners. This, he stated, was the true definition of a party wall, and "the separation of adjoining buildings is the essential factor in one part, and the dividing of different parts of warehouses is the essential factor in the other case." He held that Section 75 did not make the wall a party wall any higher than was necessary for dividing the warehouse, and that Section 59 did not apply beyond that point.

The conclusion to be drawn is that party walls dividing buildings in separate occupation are entirely unaffected by the above-quoted case, which only relates to the subdivision of warehouse buildings in one occupation.

The Bristol Case.

The case of *Weston* v. *Arnold*, familiarly known as the "Bristol Case," has so frequently been cited in disputes about party walls, that I may perhaps be pardoned for referring to it here. This case turned upon the question whether the plaintiff's wall, which was a party wall in the ground storey, where it divided two separate buildings, must also be a party wall in the upper storey, where it was built against only on the plaintiff's side. The Court held that it was an external wall in the upper storey, and might be rebuilt as such, preserving windows in it which were ancient lights overlooking the defendant's property. The decision of the Court was founded upon the Bristol Improvements Acts, 1840 and 1847. In the former Act, Section 26 defines a party wall as being "between separate houses, buildings, or other premises;" and in the latter Act, Section 24 provides that "every wall between separate houses shall be a party wall." As one of the judges explained, it needed some special enactment to make a wall a party wall above that portion of it which serves to divide separate buildings. Such special enactment was not to be found in the Bristol Acts; but in the London Building Act such enactment is believed to subsist in Section 59, which provides that "every party wall shall be carried up above any part of any roof opposite thereto and within 4ft. therefrom."

Windows in Party Walls.

By Section 101 it is provided that nothing in the Act shall authorise any interference with easements of light or other easements relating to a party wall. Windows and ventilators are found existing in old party walls; and when buildings are erected or roofs are raised against such walls, the question arises how the provisions of Section 59 are to be applied. It appears that, if the owner of the windows or other openings does not object, the space on the adjoining side may be roofed over, without necessarily contravening any provision of the Act. When a roof is constructed against a party wall, under a window or other opening, the usual practice is to treat the sill of the window or the bottom of the opening as the top of the party wall, for the purposes of Section 59, in relation to the new roof. Of course it follows from this, that any lantern light or other erection opposite to a window in a party wall must be kept 4ft. away from it.

(*To be continued.*)

WITH GREEK BUILDERS.

BY JOHN A. MARSHALL.

(*Continued from page* 145, *No. CCXLIV.*)

VI.—CORONÆ AND EAVES TILES.

> "*The swallow builds the cornice round,*
> *Unconscious of the beauties she plasters up.*"—
> GOETHE.

REFERENCE has already been made in previous articles of this series to the corona, or main drip-stone of a Greek building; it is now proposed to consider this feature more especially in relation to the tiling, with which it was so intimately associated.

Virtually, the stones of the corona constituted the eaves of the timber roof—translated into stone; but practically they afforded a broad and even bed on the top of the frieze for the eaves tiles, and the rafters, while the overhanging portion kept the water which fell from the roof clear of the frieze and architrave. As a counterpoise to the projection in front the stones were tailed on to the frieze as far as possible, and often weighted by an additional course at the back, which received the feet of the rafters in notches cut for the purpose.

The jointing of the corona in buildings of the Doric type was regulated by the position of the mutules on the soffit; these were placed over the triglyphs and over the centre of each metope, and the corona was jointed at the side of every other mutule, to avoid cutting through the latter, and to break joint with the stones of the frieze. (See diagram from the Parthenon.) A noteworthy exception to this rule was the very early temple at Assos, where the joints were in the middle of the mutules, but, it should be noted, the mutules of the corona and the regulæ of the architrave are, in this instance, devoid of guttæ.

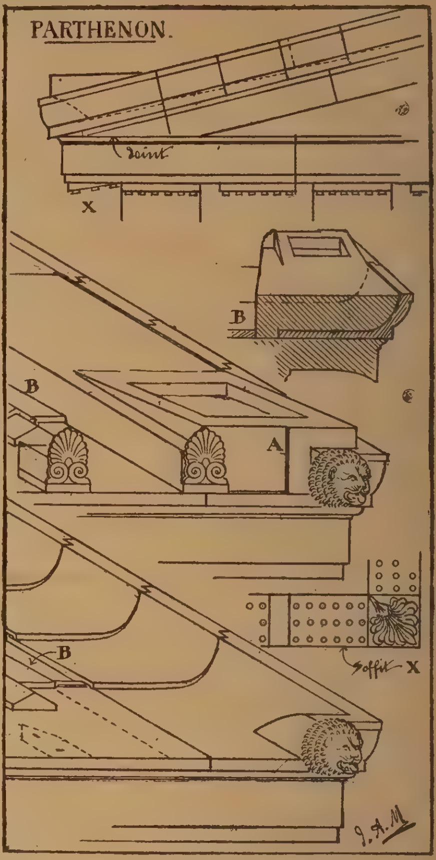
At the springing of the pediments a portion of the raking corona was sometimes worked on the same stone as the angle sima, with a level bed, resting on the angle stone of the horizontal corona, as at the Parthenon and the Propylæa. At other times we find a portion of the raking corona worked on the horizontal, so as to form a check against the pressure of the coping stones of the pediment, as at the Erectheion. The tendency of the raking stones to slip was, in all cases, further counteracted by the weight of the acroteria.

To receive heavy sculpture, the triangular cavity enclosed by the coronæ of the pediments was generally increased in depth by setting back the tympanum beyond the face of the frieze, so that the figures were not entirely supported by the overhanging portion of the corona, but were partly dependent on the frieze and architrave.

The refined under-cutting on the soffit of the raking corona—in curve like an eagle's beak—is worth noting, as obviating the depressive effect of a perfectly plain surface.

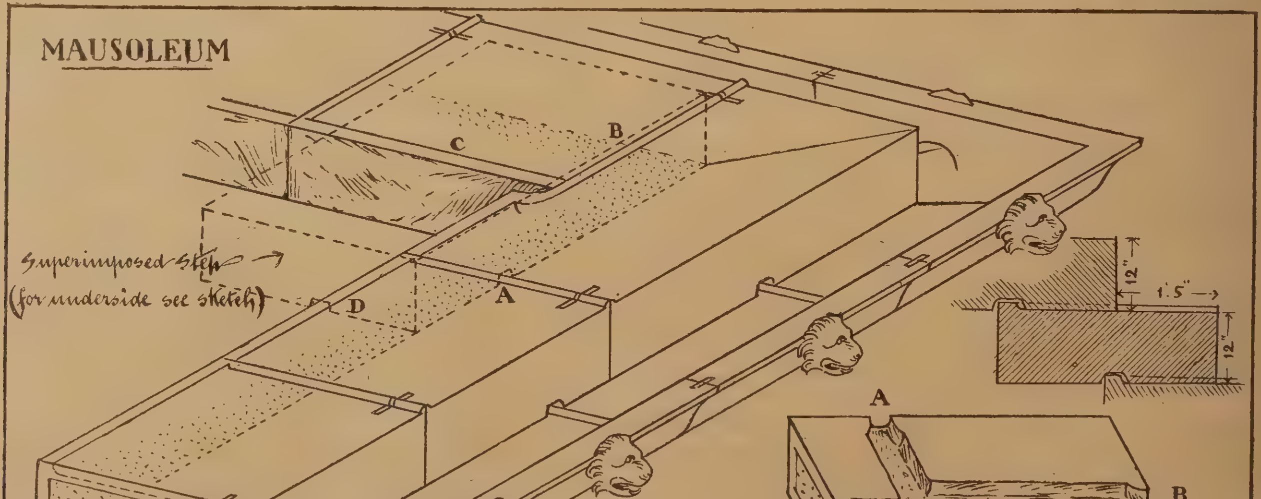
On the flanks of a building the top bed of the corona was prepared to suit the requirements of the eaves tiles, which varied considerably in different buildings, according to the size of the structure and the age in which it was erected.

In early work—prior to that of Periclean Athens—the eaves tiles were invariably of the same width and thickness as the general tiling, and to receive them the top bed of the corona was bevelled along the front to the pitch of the roof, as at Assos and Aegina; but when the temple was very large it was found more expedient to work the inclination on separate stones placed on the corona, as at Selinus (temples C and E) and the Zeus Temple at Olympia.



During this early period the shape and tenuity of the terra-cotta prototype, including the deep sima, was very often translated into marble, although the practical reason for limiting the thickness of burnt clay did not, of course, apply in the case of stone. (See restoration of eaves gutter for the archaic temple at Ephesus in the Museum).

It remained, apparently, for the Athenian architects to break away from the traditional type, by devising an arrangement for the eaves which was in every way superior to the earlier method. Instead of making the tiles uniform in width and thickness from the ridge to the eaves, and bedding the eaves tiles on



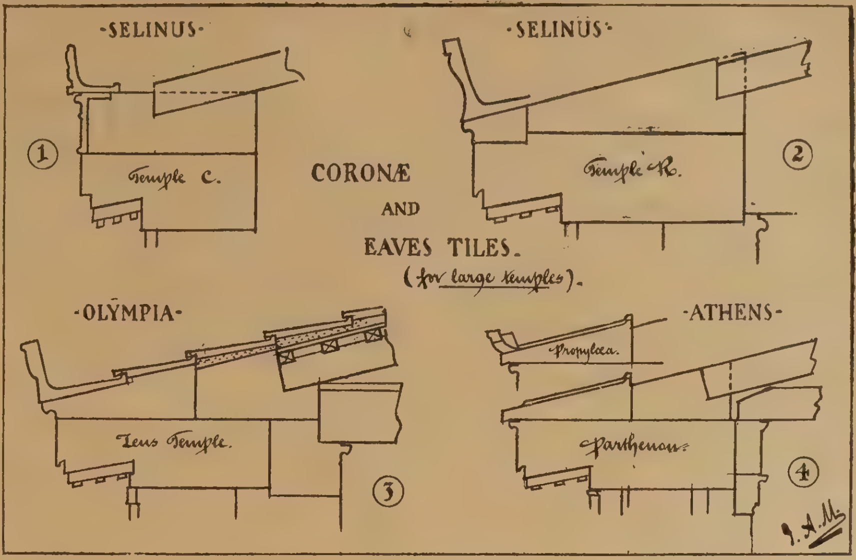
separate stones worked to the pitch of the roof, these stones are made to serve the purpose of tiles by shaping them on the top like the rest of the tiling; while to limit the number of joints, and thus ensure greater resistance to the pressure of the roof, the blocks were generally made to include in their length two or three of the ordinary tiles, as at the Parthenon and the Propylæa.

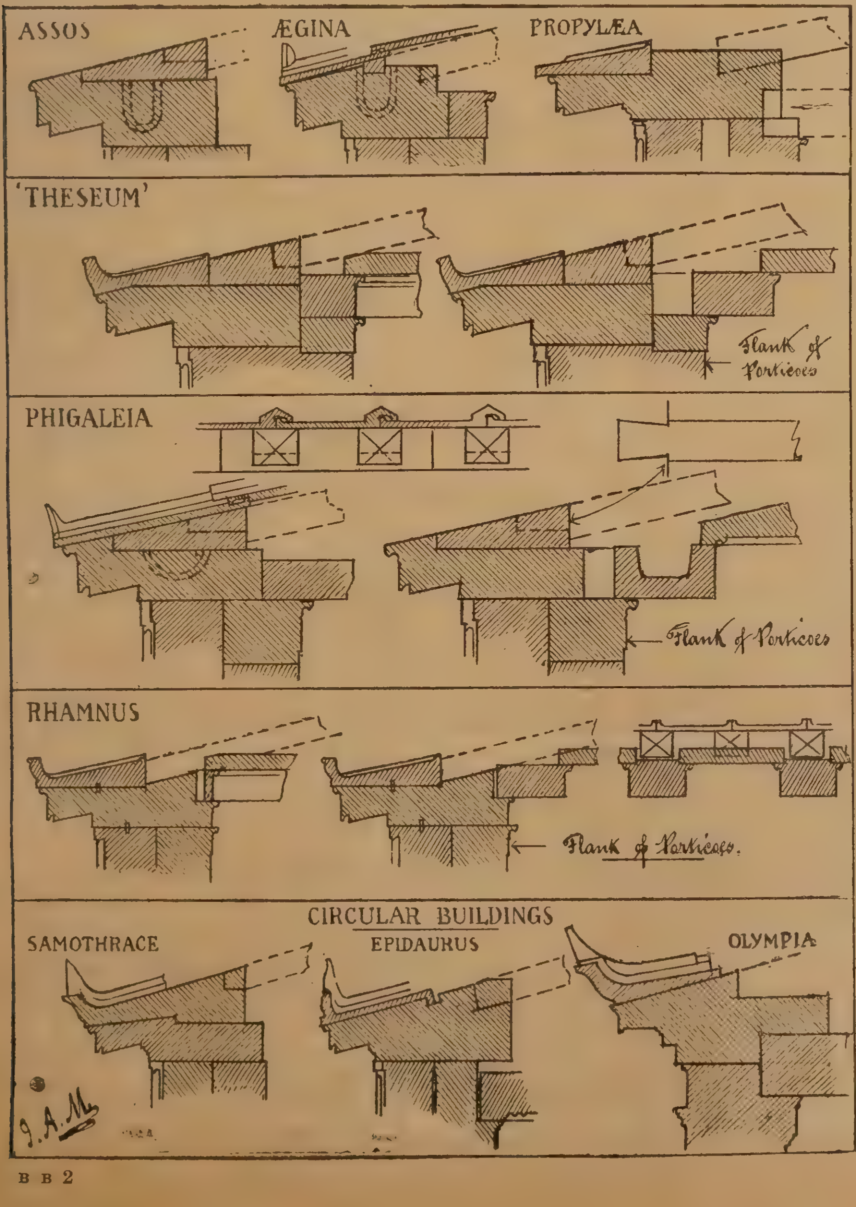
It should be mentioned that for buildings of the Doric type both the above methods were adopted, with slight variations, even down to late times; but for Ionic buildings the latter method was exclusively used, on account of the sima, which was always the crowning feature of the Ionic entablature and required as much counterpoise as possible.

As before stated, the rafters did not usually rest directly on the corona, but a separate course was placed on the back, and notched for the feet of the timbers; this extra course was worked to the pitch of the roof, in continuation of the bevel on the corona or of the slope on the eaves stones, as the case might be. For small buildings the separate stone plate was often omitted by making the corona sufficiently high at the back to catch the rafters. (See the sections from Aegina, Rhamnus, the wings of the Propylæa, the "Tholus" at Epidaurus, and the Philippeion at Olympia.)

The semi-circular grooves so often found cut into the ends of corona stones were for the purpose of inserting the loop of a rope, by which the stones were raised.

A few examples will now be given by way of further illustration; the sections given on each diagram are arranged as nearly as possible in chronological order, and are drawn to a uniform scale.





Selinus (*Temple C*). A very early and massive structure, somewhat abnormal in detail; the roof plate is a plain rectangular block the full depth of the corona; it is notched at the back for the timbers, and the front is cased with a terra-cotta facia, above which is fixed the terra-cotta sima of the eaves tiles. This, like some of the fragments found at Olympia and elsewhere, suggests the application of terra-cotta enrichments to timber construction—no doubt the prototype for the later developments in stone. (See the terra-cotta fragments in the Museum from Falerii and Lanuvium.)

Selinus (*Temple R.*).—Later than the preceding, it shows an advance, in having the inclination of the roof worked on the plate; the latter is very large but does not come to the front, as it was evidently found expedient for a building of such massive proportions to work the cymatium moulding of the corona on a separate stone.

Olympia (*Zeus Temple*).—This shows a further development, and is only a step removed from the full perfection attained at Athens. It was one of the largest temples in Greece, and, to limit the size of the corona stones, the cymatium of the corona is worked separately on large blocks—suggestive of the massive eaves tiles of the succeeding period.

For small temples the whole section of the corona was included in a single block, and if a separate blocking course was provided for the rafters it rested in a rebate, cut out of the back of the corona, and was thus kept in position against the thrust of the roof. To have worked this course on the corona would have entailed more labour than sinking the rebate. (See the sections from Assos, Aegina, and Phigaleia). We have included Aegina in the last category, but it is somewhat exceptional, for, instead of a separate plate for the rafters, the latter rest on the top of the corona, and a small block is inserted at the foot of each rafter to provide extra abutment. At Phigaleia the same object was attained by dovetailing the ends of the timbers, so that the whole depth of the rafter was made to abut against the back of the stonework. The corona, it will be seen, is after the early type, although this temple was probably built at a time a little later than the Periclean.

The examples from Athens and Rhamnus may be classed together, as exhibiting the fully developed method of the best period. The general principles underlying this method have already been described, and it only remains to point out some special peculiarities or modifications.

The Parthenon.—Perhaps the only example of so early a date where the corner stone of the sima remains *in situ*; its preservation is no doubt due to the fact that it forms part of a solid block, including, as before explained, a portion of the raking corona; it is also weighted, and kept in position by an enormous stone which supported one of the acroteria, and which is shaped on the underside to fit the curve and overlapping parts of the sima tiles on the pediment. (See an interesting diagram by Mr. Penrose, in his "Principles of Athenian Architecture.") The slight break marked A on our diagram, is, we believe, omitted by Mr. Penrose, but it certainly seems a refinement worth noting, forming, as it does, a square compartment for the lion's head, besides avoiding the unnecessary labour of sinking down the whole face of the stone in order to define the outline of the anthemion, which is worked on the same block. It will be noticed that a strip is cut out of the tiles at B to receive a corresponding strip worked on the underside of the superimposed block, so that it may catch the back of the eaves stone, but how the joint at B was made watertight is more than the writer can say.

The "Theseion," or "Hephæsteion"—to apply its latest designation—has the top bed of the corona level, with the exception of a strip along the front edge which is inclined; this was evidently done to limit the height of the cornice, and it has necessitated a corresponding bevel on the bottom bed of the eaves tiles. A similar expedient was adopted for the Temple at Sunium, but here a notch is cut along the back of the bevel as a check to keep the eaves tiles from slipping.

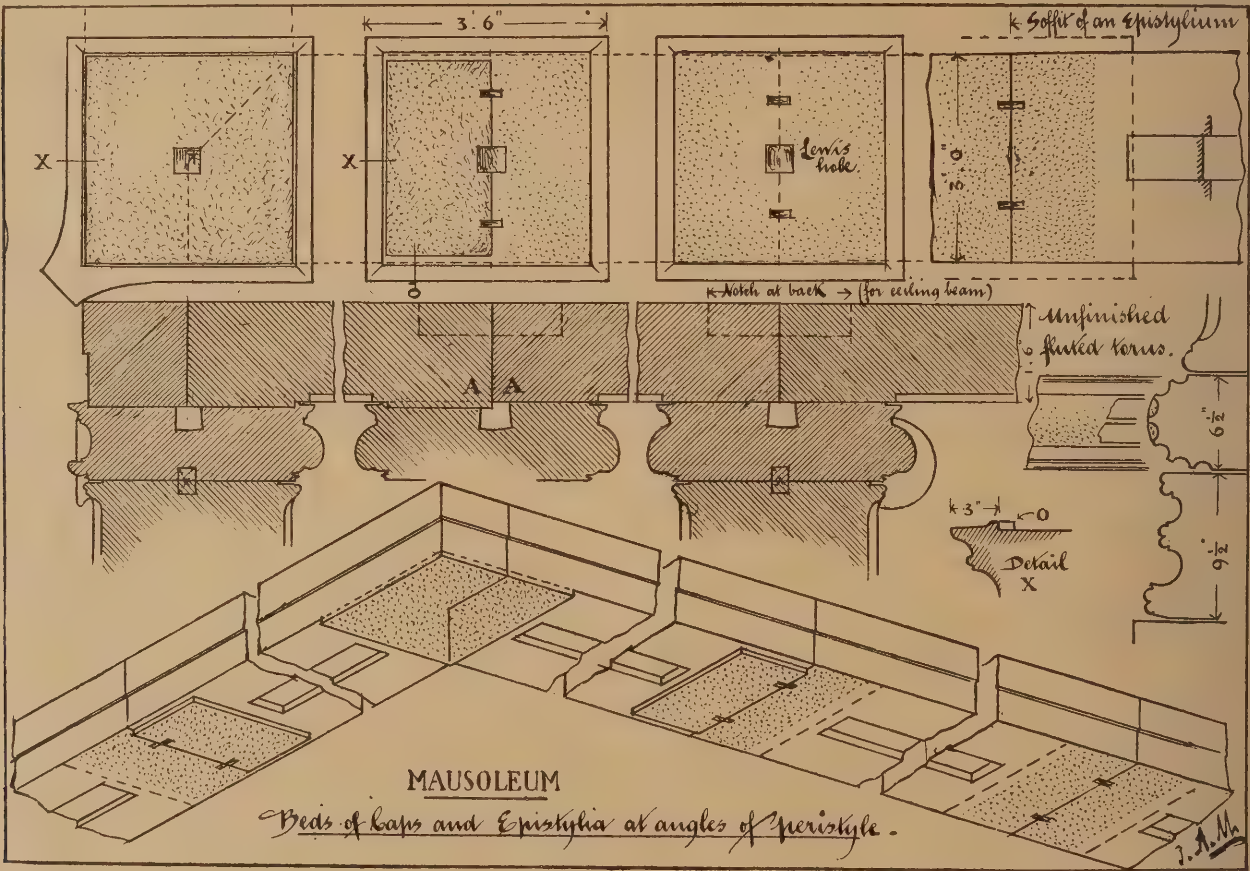
The Propylæa.—It is only necessary to note that for the wings of the Propylæa there was no separate roof plate, but the back of the corona stones was notched for the rafters, and the front rebated for the eaves tiles. The latter were always worked on separate stones, so that the joints could be adjusted to suit the ordinary tiles, otherwise in this case they might well have been worked on the corona. The reason for sinking the eaves tiles into the corona was clearly to restrict the depth of the cornice, while maintaining the necessary counterpoise.

Rhamnus.—The Temple of Nemesis was comparatively a small structure, and it was not worth while working separate plates for either the rafters or the ceiling beams, so we find them worked on the same stones as the corona.

The three examples from circular buildings of Hellenistic times are interesting as showing how the antefixa of the cover tiles were shaped to the back of the sima, so as to rest on the top edge.

The "Arsinoeion" at Samothrace, and the "Tholus" at Epidaurus were almost beyond the pale of pure Greek work, yet lavishly beautiful; while the Philippeion at Olympia—Ionic in type—possessed all the characteristics of degeneracy.

Finally, the Mausoleum may be noticed, although in the treatment of the roof and cornice this building presents but little in common with the preceding examples.



MAUSOLEUM

Beds of Caps and Epistylia at angles of Peristyle.

In the British Museum may be seen several stone steps which formed part of the pyramidal roof; there are also fragments of the eaves gutter.

The rolls, for keeping the water out of the joints, are received at the back of the stones by a raised rim, and the underside of each step is roughly channelled or grooved to fit over the projections.

Where the end of the groove shows on the riser (at A and B on the diagram) the opening is contracted and slightly undercut, or "throated," so as to fit closely over the rolls; on the top bed the stones are "weathered" and iron clamps, of late pattern, were let into the exposed top surface; the rims at the back would also serve to keep the steps from being pushed outwards.

While on this subject reference may be made to what seems to be a precaution against the displacement of the architrave by the pressure of the pyramidal roof at the angles of the building. In the Museum are three caps belonging to the columns of the peristyle; one of these is an angle cap, the top bed of which is slightly sunk, leaving only a narrow raised margin around the abacus; another cap has a similar sinking on half its bed only, while the remaining cap has no sinking whatever; it is evident, therefore, that a corresponding projection or seating was worked on the bottom bed of the angle architrave, to secure the latter to the cap.

This precaution, it may be observed, rendered the insertion of iron dowels unnecessary on the angle cap. At O the scamillus has a wider margin than at X, so that the contiguous ends of the epistylia AA were bedded in a uniform manner on the front edges.

The subject of roofing tiles as applied to Greek buildings is reserved for a final chapter.

(To be concluded.)

Reforming the Louvre.—The present unsatisfactory arrangement of the exhibits at the Louvre is to be thoroughly remedied by a scheme now receiving the attention of M. Georges Leygues, the Minister of Fine Arts.

Keystones.

Brockwell Park, London, S.E., is proposed to be extended by the acquisition of 42½ acres of wooded land. The park at present comprises 86 acres.

Improvements at King's College Hospital, Lincoln's-inn.—The electric light has been installed in this building, and the wards have been re-floored with teak blocks, at a cost of about £3,000.

Additional Workmen's Dwellings at Aberdeen are to be erected in Urquhart Road, but (owing, we understand, to some friction) Messrs. McMillan, and not the city architect, Mr. Rust, will prepare the plans.

Another Historic Estate for Sale.—White Webbs, Enfield, with about 250 acres of ground, which became notorious in connection with the Gunpowder Plot, will be put up for sale on the last day of this month.

Artisans' Dwellings at Burton-on-Trent are now being completed from designs by Mr. T. Jenkins, who has also prepared the plans for a second block. Mr. Jenkins is also the architect for the interior alterations now in progress at Stapenhill Church.

The Glasgow Institute of Architects held its annual general meeting on October 17th, the president, Mr. David Barclay, being in the chair. The report stated that the membership now amounts to seventy, exclusive of honorary members, and that the funds are in a satisfactory state.

New Baths for Manchester.—The Baths Committee of the Manchester Corporation have passed a resolution recommending the City Council to purchase 3,000yds. of land in Johnson Street, Bradford (the purchase price being 6d. per yard) for the erection of public baths.

Sale of a Grimsby Church.—St. Barnabas Church, King Edward Street, Grimsby, was sold recently. The proceeds will go towards building another church, which is to supplant the old one. The building is 84ft. by 34ft., of corrugated iron lined with matchboarding, and was built twenty-five years ago at a cost of between £500 and £600.

AN IDEAL CITY MADE PRACTICABLE.

A CHAT WITH THE AUTHOR OF THE SCHEME.

A FEW weeks ago we called attention to a scheme which has lately been given to the world, through the medium of a little book by Mr. Ebenezer Howard,* for the establishment of ideal communities, or, we should say, perhaps, of communities which approach more nearly to the ideal than any at present existent amongst us. Briefly the proposal is that a city should be built in some agricultural district in England where the most approved methods of building, engineering, and sanitation should be adopted, and where all the inhabitants should live under the healthiest conditions possible. If towns and villages can be started by single individuals or manufacturing firms—such as Pullman, Sir Titus Salt, and Lever Brothers—a body of manufacturers acting together, it was argued, could secure the same ends more easily and with the hope of establishing far more desirable conditions of existence. Such, very baldly stated, is the proposal which is set forth in great detail in the pages of "To-morrow," a book which is to be regarded by no means in the light of a speculative essay, after the manner of More's "Utopia," or Edward Bellamy's "Looking Backward," but as a practical contribution to the solution of a serious and pressing problem.

The first attitude of the average man on being confronted with a new project for the amelioration of what seems to be a firmly established state of society, is one of amused, or perhaps contemptuous, scepticism. After a while he is apt to approach the proposal in a spirit of inquiry, and with a willingness to weigh the pros and cons. of the subject. Assuming that many of our readers have now reached the questioning stage with respect to Mr. Howard's scheme and the methods by which he and his fellow-workers of the Garden City Association seek to put it into practice, we recently sought an interview with him in order to put before our readers some further information on the subject.

One cannot talk to Mr. Howard for many minutes without clearly perceiving that he is no mere visionary enthusiast. Enthusiasm indeed he has, as every reformer must have, but it is enthusiasm of the serviceable, business-like order. Mr. Howard shows no desire to get away from the actualities of things; he recognises difficulties, and meets, without trying to evade, them.

A few points only from a lengthy conversation can be touched on here. We asked Mr. Howard about the name "Garden City" with which he has designated the imaginary city he hopes one day to see actualised.

"The name," he said, "suggests one of the important features of the proposed city. Just as a well-ordered house has a garden attached to it and plants and flowers within it, so should a city have an area of open country closely surrounding it, and easily accessible to all its inhabitants, as well as ample parks and gardens within its boundaries. In the plan of a section of the city that has been prepared (and is here reproduced) it will be seen that ample provision is made for open spaces. This diagram, of course, is merely a suggestion. A circular plan, with public buildings at the centre and factories at the outer rim, seems to present several advantages, but it is by no means an essential feature of the scheme."

"What about the ownership of the land in Garden City. The idea would be to eliminate the private landlord, would it not?"

"Yes, but by purchase, not by confiscation. The landlord would be paid the full value for the land upon which the city is to be built, and we should endeavour to attract people by ensuring them the full increment of value which would necessarily spring from the growth of the city. The community would be the landlord, and would impose only such rents as would be required to pay the interest on the purchase money, provide a sinking fund, and carry on such public services as are elsewhere maintained by rates."

"There will be no private freeholders, then, in Garden City?"

"No. But we hope to convince people that a lease under the conditions offered is better than a freehold under ordinary conditions. The leases will be practically perpetual, so that there will be no reversion of the property. What is more common than for the owner of a freehold house to find that the value of his freehold is diminished by a factory being started near, or a row of shops, or by some other freeholder putting up immense hoardings to prevent the acquirement of 'ancient lights'? A leaseholder in Garden City would be free from these disabilities. The rates are thrown on his land, but they are taken off his house."

"I wish I could get the public to grasp," continued Mr. Howard, "that a raw piece of land, practically unbuilt upon, in a healthy country, not far from a railway (even this may be built), may often be made most suitable for settlement because it is like a clean sheet of paper on which you can draw."

"It is desirable, no doubt, assuming that you draw properly."

"Quite so," assented Mr. Howard, "but the possibility is there. And it is, perhaps, because of the magnitude of the possibility, because of the glamour surrounding the building of a new town from the very beginning that people are afraid it cannot be a practical idea. That there are difficulties, is admitted, but they are not difficulties inherent in the subject itself. No law of nature is violated by an experiment of this kind."

"The work of the Garden City Association, I understand, is for the present chiefly propogandist. Will you please tell me just how—when the educative process is fairly complete and a sufficiently numerous body of the public have assimilated the idea—it would be proposed to make a practical start?"

"Manufacturers now," replied Mr. Howard, "often find it convenient to migrate from London and other great cities. What then could be more natural than that a number of manufacturers should combine together and migrate in company? A number together could secure advantages, alike for themselves and for their work-people, impossible for one alone. It is by such a concerted movement of manufacturers in sympathy with the ideal of a garden city that we hope the first of these cities will be started."

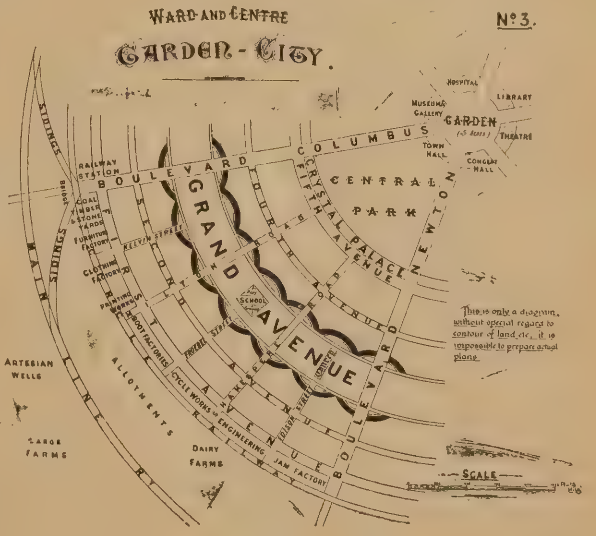
"Supposing the experiment succeeded to such an extent that people were attracted in great numbers, how would you prevent the city growing beyond the modest dimensions which you suggest as desirable?"

"Let me answer that by referring to existing conditions in London. No one would advocate building on Hyde Park or Regent's Park. Yet each of these parks might be said to be a barrier against growth: though they do, in fact, but prevent a mode of growth which, but for them, would be disastrous. But there is a far better illustration, if we go to South Adelaide. That city has adopted—though not on quite so generous a scale—the very system I advocate. The city of South Adelaide is surrounded by 'park lands,' as they are termed, of greater extent than the city itself, which, having been built up within this park enclosure, grows by leaping over its park lands and by spreading out into North Adelaide. Now I contend that the inhabitants of a whole group of towns, if they are not too remote, and if adequate facilities of transit are provided, may be more truly members of one community than are the inhabitants of, say, a western and an eastern suburb of London. Of course, the question whether the 'park lands' around Garden City should be in any measure built upon, or whether they should continue to be used mainly for agricultural purposes, would be decided by the community itself; but I think it is safe to conclude that a community, called into existence by the evils of overcrowding, is not likely to act in such a way as to cause a recurrence of the same calamity."

There is one point about this scheme which should not be lost sight of. It is not the project of a sect or clique, but appeals equally to people of all creeds and parties. This fact was curiously brought out as Mr. Howard mentioned the names of people who have already joined the association. While the membership includes some who are avowed socialists, it contains at least one member of The Liberty and Property Defence League.

"I would call my system," said Mr. Howard, "Social Individualism—individuals grouping themselves in a social manner. Of course nothing is cut and dried; a project like this leads people just as far as they desire to go in the direction of collective effort."

Mr. Howard pointed out the special attraction his scheme should have for architects and engineers, and with his remarks on this head we will conclude this *resumé* of the conversation. "Building on the lines suggested, or on the more suitable ones which discussion may evoke, or contours or natural surroundings may demand, would bring architecture up to a higher plane. Architects would no longer consider merely the small site on which they are erecting a building. They would take a larger view; they would consider the whole town, and group their buildings symmetrically and conveniently. They would be guided by the contour and natural features of the sites, and would seize upon some inequality of surface to introduce some beautiful effect. Thus there would be a congruity of design and beauty of proportion between the various buildings which is impossible under existing conditions. The establishment of garden cities would mean a renaissance of architecture. So in regard to engineering, there are great advantages in working on a blank sheet. No water engineer, so far as I know, has studied a large tract of bare land and endeavoured to consider how far it could supply the needs of a people for water, with all its varied purposes of utility and beauty—a people who have not yet come there, but whom it is intended to attract by (among other things) a well-devised system of water supply. Systems of water supply are not provided until the needs of the people have actually arisen or become urgent, and by this time there are usually numerous hindrances to anything like a truly scientific system. Greater foresight will lead to marvellous results in this and many other directions."



The work of familiarising the public with the principles of the Garden City Association is being actively proceeded with, and a number of committees have been formed with definite special objects. A public meeting in furtherance of the objects of the association is announced to be held at the Memorial Hall, Farringdon Street to-morrow, October 26th, at seven o'clock, Mr. T. H. W. Idris, L.C.C., in the chair. Meanwhile, any of our readers who may wish for further details of the scheme can obtain them from the hon. secretary of the association, Mr. F. W. Steere, 4, Stone Buildings, Lincoln's Inn, London.

* "To-morrow: A Peaceful Path to Real Reform." By E. Howard. London: Swan Sonnenschein and Co., Ltd. 2s. 6d.

ARCHITECTURAL ASSOCIATION OF IRELAND.

INAUGURAL ADDRESS.

THE opening meeting of this Association (the session for 1899-1900) was held in the Grosvenor Hotel, Dublin, on October 17th, when Mr. G. P. Sheridan, A.R.I.B.A., delivered his inaugural address, of which the following is a *resumé*:—It is unnecessary that you should be wearied with many retrospective references. We are a youthful association, being but three years in existence, but our past, short as it is, can be summed up in one word—success. We may fairly claim to have done good work, and to have aroused amongst the younger members an enthusiasm which, I think, has never previously been understood in Dublin.

But, gentlemen, my duty to-night is not so much to dwell on the past, as to consider how best to direct our conduct in providing for the near future, and encouraging an earnestness, in mutual assistance, towards that improvement, which is calculated to best help us in expressing the nobler aspirations of the age in creations of the true and beautiful, and which may be a benefit and a pleasure to our fellow men.

The success of the association as an educational body depends on the individual volition of the members. I need hardly refer to the importance of attendance at the classes. Perhaps of all the classes the sketching and measuring class is the most important. We all know sketching is inseparable from an architect's education—how it trains the eye in proportion and judgment, concentrates the attention on detail, and assists the mind in understanding and recording the effects produced in deceased architecture. I exhort you to practice it when and where you can, and it is astonishing what proficiency may be arrived at by a little persistent work. Endeavour to be accurate, take pains, and stick to it. There are perhaps many benefits to be derived from a system of architectural education—supplemental to office work—and well suited to assist in an effective training of the hand and mind. But an advantage I place above these and which these must lead up to is the development of a mental condition which seeks to investigate what architecture is, and endeavours to understand why certain forms are beautiful, and why varied emotions are excited in the contemplation of different buildings. In order that an architect might be able to create an architectural composition to give pleasure to those who shall behold his work, it is well he should have knowledge of some of the causes which influence appreciation. Architecture depends a great deal for its attribute of beauty in the manner in which it occupies space, and it is not dependent on ornamentation, and, consequently, I believe architectural beauty for the most part consists in the due proportion observable in the outline of a building and its several parts. Colour, to a certain extent, adds beauty to architectural works, but in order that it should do so it must, I think, have the character of necessity, and not of having been adopted for the sake of ornament alone. Contrast a red brick building with one that is painted brick colour. The knowledge of the nature of materials and their adaptability to the uses for which they are employed also influences ideas of beauty. The history of architecture in its archæological sense is a history of the progress of man's knowledge of the use and nature of building materials.

And the qualifications of the materials in any country to some extent explain the peculiar characteristics of its architecture. Again, I think, a building to be beautiful must give us the idea that it is able to withstand the injurious agencies of Nature, which are always tending to destroy it. It should appear stable and not top-heavy, and that material which appears the most lasting to some extent affects the mental condition forming ideas of beauty. The emotion of the sublime may be excited by the size of the building. If of great height the feeling may be that of fear of the pile falling, but this feeling might be caused by a somewhat similar condition in nature as by a high perpendicular cliff. But the emotion of sublimity, produced by buildings of architectural merit, arises when we reflectively connect their existence to the mind that conceives them, and to the mental effort of guiding the progress of the work. The difficulty with which we know an architectural work to have been accomplished, perhaps, adds still more to the emotion of the sublime. A certain amount of recurrence of the same effect in a building gives us an idea of sublimity, because it suggests the whole edifice is the effect of one single conception in the architect's mind. Beauty in effect is added to a building when it expresses the uses for which it was erected.

These are some of the ideas and forces that influence the mind when seeking for sublimity and beauty in work embodying architectural aspirations. And I may add that simplicity, when used as a means of obtaining a successful effect in architecture, always lends dignity to beauty. Similarly, truthfulness in construction, when expressed with simplicity and unobtrusiveness, is associated with beauty.

> How much more beautiful doth beauty seem
> By that sweet ornament which truth doth give.

Why should we not make the graceful couplet the banner under which our association could advance in its work of education and reform? It would influence our conduct, and, perhaps, at times, be as a protecting Aegis against the onslaughts of a dictatorial client. Ah! the client! He is the man that pays and knows what he wants! He must be pleased! And when we try and please him we probably shall fail. When we give richness he says we are vulgar, and when we endeavour to express the wants with simplicity, he insists that our work is poor. Well, perhaps he is right. He looks at things with a different eye from what we do. He influences the direction of architectural change, and may stamp the spirit of the age on the buildings rising around us. No! the architect should be the interpreter of expression, and he should reign supreme in the realm of architecture.

Each generation has not the same knowledge nor desires as the preceding one, and each age has its special good points and its special character stamping the architecture of the period with the general aspirations of the community. We are always changing, always moving onward, and the architectural judgement is likewise influenced.

In this very practical and material age, the fine arts are considered as something apart and not as an embodiment of the public mind as in epochs past. And it is difficult to say in how far the work of to-day repeats, architecturally, the aspirations and characteristics of the time we live in. In this restless age, when the spirit of keen competition creates a feverish desire for change and novelty, it is very difficult to point in what direction the tendencies of to-day appear to be drifting. But perhaps I may not be far astray in suggesting that a "studied simplicity" is apparent in the "motifs" of modern life. I think it can be traced through the different phases and conventionalities of our every-day existence. Persons assume a virtue, if they have it not, in simplicity of manner and address, and decry the extravagances of a former generation. They will reject with affected disgust the ornate and massive, and display a ready preference for the opposite though it borders on the crude. It peeps out in our social relations, and even in the fashions affected by the fair sex we see an attempt at this "studied simplicity." I have called it a "studied" simplicity because the adjective stamps it as spurious. It lacks the grace of refinement, of true and unconscious simplicity and the dignity and breadth of restraint. And modern architecture, taken *en masse*, is beginning to express in material form this spurious simplicity. I might even go farther and say that, as the result of this tendency, a cult in architecture has developed which might be described as the "cult of crudity." It is certainly untrammelled architecture, as all sorts of liberties are indulged in and departures made from what has been considered orthodox. Academic architecture is left severely alone, and the gradual development of centuries methodically ignored. And all this is to be accounted for by the effort of the everyday architect to appear in his work as a man possessed of superior knowledge, and to suggest that he could do a great deal more if he tried, or show his independence of precedent by endeavouring to gain a commanding effect—by a "studied" simplicity in composition, supplemented by a crudity in detail, almost unparalleled in the history of our art.

Great wall surfaces without any counterbalancing and contrasting features are thrust at us, or perhaps a strip of sculpture is crudely planted on which has no meaning in the unity of composition. Entablatures are distorted and the parts perhaps interchanged in a way calculated to make you reflective, if not sad. Columns are attenuated and appear without a base, or are finished with a sickly mould in lieu of a cap—or, again, are distorted with an apalling entasis associated with an ill-used bolster, and perhaps are ladened with rustications to such a pronounced effect as to present the appearance of a scarified salmon.

Instances might be multiplied if time permitted, but I must not pass on without letting you understand my references are only in a general sense. Excellent work is done now, and which may well be said embodies the true and beautiful in a way which demands our admiration, and in which departures are made from proportions which for generations had been accepted as fundamental in good design, and in which originality is not defined so much by novelty as by a modified adaptation of precedent, carrying with it respect for that which has gone before. Simplicity with the authors of these works meant repose, and unity, and restraint, and truth; they introduced ornament where ornament spoke to you most, or omitted it where truth could best be expressed without it.

These men are working up to high ideals. They make the sciences subservient to the principles of design and expression; they are not afraid to accept the advantages which science empowers them with, as they understand it is only knowledge which can be viewed and considered architectually. They consulted the past for suggestion, and understood the feelings which move the early architects who, as Smiles in his book on "Duty" says: "Put their Spirit into their work; they put religion into their work. Their architecture had life, and truth and love and joy in it. It was chiselled music."

A New Hall to Hope Street Church, Liverpool, has been built from the designs of Mr. James Rhind by Messrs. Haigh and Co. It accommodates 200 persons.

A New Chapel at Shirebrook, near Mansfield, is about to be erected from designs by Mr. J. Perkin, architect, of Shirebrook and Leeds.

Fall from the Apperley Bridge Viaduct.—A shocking accident occurred on October 18th at the extension works on the Midland Railway between Thackley and Apperley Bridge. A joiner named William Newins was engaged in some scaffolding which is almost on a level with the nine-arch viaduct spanning the river, when he overbalanced and fell to the ground below. He alighted on a heap of bricks, and was picked up in an unconscious condition.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

SPRING FLOOR FOR DANCING.

To the Editor of The Builders' Journal.

Westminster, S.W.

Sir,—I should feel obliged for any practical information on this subject, or where particulars could be obtained.—Yours truly,

QUERIST.

Information on this subject will be found in the part of an article on "Practical Carpentry and Joinery," by Mr. Geo. Ellis, appearing in The Builders' Journal and Architectural Record for January 26th, 1898.

APPOINTMENTS IN THE CIVIL SERVICE.

To the Editor of The Builders' Journal.

Lowestoft.

Sir,—Will you kindly inform me through your valuable paper, The Builders' Journal, where to apply for particulars of appointments under the Civil Service, and oblige,—Yours &c.,

E. H.

There are many books published giving particulars of how to obtain appointments in the Civil Service—the local bookseller would get one for you. We shall publish, in the course of a week or so, an article on technical appointments, which will no doubt be useful.

CLEANING BRICKS.

To the Editor of The Builders' Journal.

Belfast.

Sir,—I should be glad if you could give me a recipe for cleaning Aston Hall buff bricks that have become dirtied by mud.—Yours faithfully,

R. H.

A good brushing with a stiff bass dandy or steel wire "trimming" brush, followed by a scouring with a similar brush, may, perhaps, be sufficient to remove the discolouration of the face of the dirtied brickwork; but, if not, the application of a solution of *white* copperas in water-strength, according to tone required, should be tried. If necessary a little ochre may be added to the copperas solution, and sample coatings should be made before any general application of the solution is indulged in.

H. E.

DYE AND COLOUR MAKERS.

To the Editor of The Builders' Journal.

Blackhill.

Sir,—I shall be greatly obliged if you can furnish me with the address of a firm or agents who make aniline dyes or transparent colours (water) for decorative purposes. They will need to be of extra strength, depth, and purity in working. Ordinary water colours are too weak and not sufficiently transparent for the required purpose.—Yours faithfully,

ETRUSCAN.

The following are makers of, or agents for, aniline colours: Brooke, Simpson and Spiller, Ltd., 10, New Broad Street, London, E.C.; Henmann, Keller, and Co., 102, Fenchurch Street, E.C.; Levinstein and Sons, 24, Railway Approach, S.E.; Wilkins, Campbell and Co., 242, York Road, N.; Zerenner and Co., 53, New Broad Street, E.C.; J. D. Wilson, West End Works, Richmond Road, Bradford.

GARDEN WALL BOND.

To the Editor of The Builders' Journal.

Sevenoaks.

Sir,—I note that in the portion of the exceedingly useful Model Answers to the Society of Architect's Examination Papers appearing on page 134 of No. CCXLIII., it is stated that Garden Wall Bond consists of three courses of stretchers and one of headers alternately. But Mr. C. Mitchell, in his book on "Building Construction," says that Garden Wall Bond is "three stretchers and one header in the *same course* constantly recurring." I should be glad if you would inform me which is the correct method.—Yours truly,

I. T.

Both methods are correct, though the method which I. T. quotes is perhaps the most usual. The bonding we gave in our answers (three courses of stretchers to one of headers) is generally called English Garden Wall Bond; the other (three stretchers to one header in each course) is known as Flemish Garden Wall Bond.

MIDDLETON and CARDEN.

BOOKS ON HALF TIMBER WORK.

To the Editor of The Builders' Journal.

Leeds.

Sir,—Will you kindly supply me with particulars of some good books on half timbered construction. Please also give the numbers of The Builders' Journal containing articles on this subject.—Yours truly,

STUDENT.

No work has been published that deals comprehensively with half timber work from a constructional point of view. Some plates of details are in the third volume of the "Abbey Square Sketch Book" (£3 3s., B. T. Batsford, 94, High Holborn, W.C.). There is also a small chapter on the subject in "Mitchell's Advanced Building Construction" (4s. 6d., Batsford). Articles dealing with half timber work have appeared in Nos. 54 and 55 (February, 1896), Nos. 144 and 150 (December, 1897), No. 227 (June, 1899) and No. 236 (August, 1899) of The Builders' Journal.

RIDDING A HOUSE OF RED ANTS.

To the Editor of The Builders' Journal.

London, W.

Sir,—At the present season, many of the houses in London which are built on a sandy soil, have the basements infested with swarms of small, red ants. Everything that is brought to table is covered with them to such an extent, that a positive nuisance results. Can you suggest any method of exterminating them, or greatly reducing their numbers?—Yours faithfully,

ROWLAND PLUMBE.

The long continued drought of the past summer has been especially favourable to the propagation of insect life, and especially in the case of newly-built houses; it has been no uncommon thing for insect pests of all kinds to have established themselves indoors, or, what practically amounts to the same thing, to have made continual raids on the house in foraging expeditions. Ridding a house of ants is usually a somewhat troublesome affair if the job is to be thoroughly done, which it must be if the "ridding" is to be effectual. The presence of ants in the region of the larder is no evidence that a colony is established indoors, although it is quite possible that, if the trouble has only recently arisen, the ants may have been driven by wet weather to establish themselves under cover. Their nests are most frequently situate at a considerable distance from the place where they are found congregating on plunder bent, and it generally needs a little patient tracking to find which point of the premises serves as ingress and egress, and, this having been found, to further follow the trail to the nest. The writer, some seven years ago, was similarly plagued, and a patient tracking of the ants through half the ground-floor premises revealed the fact that the exit hole was a crack by the cemented hearth to the kitchen fireplace, within a yard or so of the larder. The expenditure of some quarter of a pint of paraffin oil in and around the crack (in default of being able to locate the nest) proved a perfect cure, once and for all. When the nest can be located, it and its contents may be destroyed by the application of boiling water. When the nests are inaccessible, or when from any cause the trail cannot be followed, anything that will render the road travelled unsavoury will act as a deterrent, and chloride of lime, sulphur, carbolic powder, Keating's insect powder, paraffin-moistened sand, and even dry slaked lime, freely scattered about where ants abound, will ofttimes cause them to stampede in a tremendous hurry. But it may not always be convenient to employ these means, in which case traps or poison may be resorted to. Bones with a little meat left thereon, or a sponge moistened with honey (preferable) or treacle, will serve as baits, and these can be dipped into boiling water as often as they are found infested. Honey, or treacle, in a saucer, to which some Paris green (arsenical) has been added; finely granulated or caster sugar damped with arsenious acid; similar sugar mixed with calomel, two to one; and phosphor paste spread on white paper and dredged with sugar, are poisonous preparations which will destroy ants.

H. E.

CONSTRUCTING DELICATE PISTONS.

To the Editor of The Builders' Journal.

Kendall.

Sir,—Will you kindly reply to the following query:—A. on the enclosed sketch (not reproduced) is a cistern nearly filled with water. B. is a centre barrel or cylinder 4in. in diameter, open at each end. C. is a plunger or bucket. The barrel is fixed in the cylinder so that it does not touch the bottom. Is it possible to get a plunger or bucket that will work easily up and down in the barrel, and yet prevent water getting above it? I want the plunger to fall down by its own weight, and yet be as light as possible. If this can be done, would you kindly state of what materials the barrel and plunger should be made, and what weight and size the plunger should be. The great object is to have a light watertight plunger (or one practically so) which will fall by its own weight. The cistern is not filled or covered, so that water can rise without resistance. I think your paper is a most interesting and instructive one.—Yours faithfully,

IGNORANT.

The barrel and plunger should be made of copper or brass. For a simple surface guage or indicator, a hollow metal float, working loosely within the barrel, would suffice. If the circumstances necessitate the provision of a packing box or ring to the floating plunger or piston, a specially made cupped leather, properly secured near the underside of the plunger, might meet the case. Another alternative would be to insert a light and flexible ∩-shaped packing ring within a suitable groove arranged round the external diameter of the hollow and buoyant piston. Any upward pressure of the water beneath the plunger would then force the outer edge of the cupped leather or packing ring against the side of the barrel. The details for a sensitive fitting of this description must necessarily depend upon the purpose for which it is intended. A first-class firm of engineers and mechanics would probably undertake to construct a barrel and plunger adapted to your particular requirements.

T. E. C.

The Architects and Civil Engineers of Italy number 3,487, and have a united income of £181,922; this gives an average income of about £52 15s. One reports his income as varying from £600 to £800, three declare theirs to be between £400 and £600, 1,634 have incomes between £40 and £400, while the remainder—1,849—are earning less than £40 a year.

Glasgow Institute of Architects.—The newly-elected council of this institute held their first meeting on Saturday, when the following office-bearers were elected, viz.: President, Mr. David Barclay; vice-president, M. Alex. Petrie; auditor, Mr. W. Forrest Salmon; secretary and treasurer, Mr. C. J. MacLean, 115, St. Vincent Street. The various committees for the year were appointed including committees on architectural education, public architecture, and building regulations.

Bricks and Mortar.

Aphorism for the Week.

"One may make the house a palace of sham or he can make it a home—a refuge."—Mark Twain.

St. Paul's as it might have been. Archdeacon Sinclair has lately been lamenting that Wren's scheme for having a spacious churchyard around the Cathedral, surrounded by a colonade, was frustrated. This is what he says: "Wren never meant the Cathedral to be hemmed in by warehouses, but the people who held the land began rebuilding after the Fire before Sir Christopher could carry out his scheme. He wanted to have a magnificent, wide street leading direct from the West Front of St. Paul's to Westminster, or at least to Charing Cross. The view of the Cathedral is spoilt by the narrowness of Ludgate Hill. Still, it is better than it was before the widening of Fleet Street. I don't think that if St. Paul's Cathedral were in any other European city the people would allow it to be hemmed in by warehouses and shops."

Excavations at Ephesus. By many travellers in the Levant, Ephesus is regarded as an uninteresting place, but the Austrian excavators there have altered matters, and features of the greatest interest have been brought to light. Mr. F. R. C. Hutton, writing from Ayasoloak, says that the great theatre has been excavated. The whole of the columns of the proscenium and the passage and ante-rooms with mosaic pavements have been opened up, and the work is going on still in the upper portions of the theatre. In front is the street with the marks of the chariot wheels all along the pavements. There are also the whole series of buildings behind and underneath the gymnasium, including some lovely marble water-troughs, with oxen and oak wreaths and some fine marble doorways, all *in situ*. But perhaps the most interesting thing is that which is now being excavated—the lovely semicircular marble portico with its steps, which occupied the whole east side of the harbour. What there is now is most beautiful and interesting, and each week discloses something new. Perhaps to Christians there is the most interesting thought that St. Paul landed at these steps. Mr. Hutton's information is exceedingly interesting, as art, in entirety, must benefit by the unearthing of buildings erected by the great architects of the most remarkable period in the world's history.

A Boon to Craftsmen. As those who have tried will testify, it is often a most troublesome task to find a technical book in a general catalogue, and the reform inaugurated by the chief librarian to the Corporation of Liverpool, Mr. Peter Cowell, is therefore highly commendable. He has, to a certain extent, got out special catalogues for art students and craftsmen, and has so planned them that one can see at a glance the amount of information that the Liverpool reference library has to offer on architecture, the decorative arts, building construction, and similar subjects. The full library catalogue is too bulky to be used anywhere but in the building by those who consult it for such educational purposes, so that these new sectional catalogues will greatly add to the utility of the library, and be of great help to searchers. The Liverpool collection has a specially good lot of books on architecture, and this new departure seems to have been suggested by the needs of the new architectural school.

The Limits of Technique. Mr. Brownell says in "Scribner's" that current art is certainly concentrated upon physical character rather than upon beauty, and current appreciation of it is in harmonious accord with its realistic effort and aim. One may refine speculation to the point of asserting that there is no opposition, essentially considered, between the two; that Rembrandt is as distinguished for his beauty as Raphael, and that, on the other hand, there is as much character in "The School of Athens" as in the "Lesson in Anatomy." But in matters of this kind terms are approximate only, and the fact that definition is a difficult matter does not obscure the plain truth that a marked difference exists between the work of a painter in whose mind an agreeable conception of an object mirrors itself, and that of one mainly anxious to be exact. Technique has spread prodigiously (quite as much, perhaps, as it has developed) in the present epoch, and has become rather arrogant in its aggrandisement. Criticism, too, in becoming largely technical, has assisted the tendency, so far as it exerts an influence on practice. It has grown tired, no doubt, of its own common places and generalities, its easy habit of estimating aims rather than accomplishment, its routine insensitiveness to aspect and perfunctory absorption in significance. But in assuming the painter's point of view—not a very esoteric one, certainly—it has not been quite self-respectfully discriminating enough to avoid the purely professional attitude. And it is perhaps time for the pendulum to swing back again a little, so that both in estimating and in enjoying the painter's art we may once more think of its intellectual rather than so wholly of its mechanical side, which latter we may also be sure, nowadays, will be quite carefully, and in many cases competently, attended to by the painters themselves. Mr. Brownell's remarks deserve the attention of all those who, following the course of modern methods and opinions, have a tendency to become too prosaic and mechanical.

More Fire Tests. Since the foundation of the British Fire Prevention Committee, after the Cripplegate fire of November, 1897, a great many interesting and useful tests have been carried out at the Committee's premises at the side of the Regent's Park canal. A private view was given last Wednesday on the occasion of the opening of the winter session, when tests were made with a 5in. floor built of steel girders and breeze concrete (as recently classified by the L.C.C. as fire-resisting), an iron safe containing papers, and two wooden doors. The floor test was to have been of two hours and a half duration, but the floor collapsed in about an hour and a half, the maximum temperature reached being 1740deg. The safe bulged badly, and could not be opened at the close of the test to examine its contents. The most interesting tests was with the doors, one of which was of 2in. deal, and the other of 2in. pitch pine; both were solid. The fire began to break through after about fifteen minutes, and, though at the commencement it looked as if the deal door would go first, this proved otherwise, for it stood slightly longer than the pitch pine door, which collapsed after fifty minutes. The highest temperature recorded in this test was 1680deg. Mr. Edwin O. Sachs (chairman of the Executive) received the visitors, and there were also present Messrs. H. H. Collins, F.R.I.B.A., Frederick Farrow, F.R.I.B.A., and Mr. Emile Schweich. The tests were conducted by Messrs. Max Clarke, A.R.I.B.A., Charles E. Goad, C.E., F. Hammond, F.R.I.B.A., and Ellis Marsland.

St. Paul's Again. The much-harried dispute about the decoration of St. Paul's Cathedral was again brought up last Thursday, by a letter from the Dean being read before the meeting of the Court of Common Council at the Guildhall. A new reredos, he said, had been placed in the choir, and the east end adorned with three stained glass windows and two mosaics. The sides of the choir had been decorated with mosaics and the windows with stained glass. The four corners of the dome had been supplied with mosaics, a window in the south transept had been filled with stained glass, and another would be filled in the Spring. Mosaics had been placed in the roof of the north aisle of the choir. A peal of bells and a clock had also been recently added, and eight vacant niches in the dome had been filled with statues. The committee had raised and expended £150,000. Work which had been commenced should be completed. The statement that "this external work greatly added to the spiritual influence of the building" evoked cries of "Oh, oh." £50,000 more was needed to complete the work at St. Paul's, and the Dean said he would be very thankful if the Court would repeat their liberal gift. Mr. A. A. Wood said he viewed with great regret the form of the decoration adopted, and that the work was in the hands of persons who were so completely out of sympathy with the aim and object of Sir Christopher Wren. Much of the decoration had met with adverse criticism in art circles, and it was generally condemned by the public. That criticism had met with little, if any, attention on the part of those responsible for the work. Eventually, on an appeal by the Lord Mayor, the letter was referred to the Finance Committee. Many think that it would have been much better for the cathedral if the £200,000 to be spent in decorating it was devoted to some other purpose.

Rural Building Bye-Laws. A few weeks ago there appeared in our columns some particulars of the agitation created at Dartford, Eynsford, and Sutton-at-Hone about the restrictions imposed by the Local Government Board with regard to cottages, these being considered excessive and unfair. Shortly afterwards the Dartford Rural District Council held a meeting, when the question was thoroughly discussed, and on the proposition of the chairman the Council agreed that their opinion should be expressed to the Board on similar lines to that done by the authorities at Bromley, namely, that the cubic capacity should be increased to 9,000ft., the area to 900ft., and the minimum interspace reduced to 50ft.—it will be remembered that it was required that the cottages should be erected 200ft. apart. The Board have conceded to waive the stipulation that party walls should be carried up to the roof. As we have already pointed out, the existing bye-laws for rural districts need revision, in order that builders may afford to erect cottages for tenants who pay very little rent, and we hope that the present agitation will spread until the desired reforms have been effected.

The Lord Mayor's Mistake. At present thoughts of war occupy the mind to the almost total exclusion of all other thoughts—at least, this seems to be the case with the Lord Mayor of London. R.A. means Royal Academician, and it also stands for Royal Artillery. At the presentation to the Corporation of Mr. A. C. Gow's large picture of the Thanksgiving Service at St. Paul's, on the occasion of the Diamond Jubilee, the Lord Mayor, in reading the inscription on the picture, announced that the artist was Mr. A. C. Gow, "Royal Artillery." The mistake was greeted with bursts of laughter, which were renewed when the Lord Mayor went on to explain that the mistake was due to the events of the day and the meeting at the Guildhall on the previous Monday. Any excuse is better than none at all.

Mild Steel. The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held their opening meeting on Friday, the 13th inst., when Professor Gourlay presided. Professor Sexton gave an interesting lecture on the subject of "Mild Steel." He first sketched the evolution of man's habitations which had led to the necessity for, and the consequent invention of, mild steel. He showed how malleable iron was first used, then cast-iron, and after that steel, giving descriptions of their various good points and defects. He considered that Bessemer's invention of mild steel was one which would eventually revolutionise the structural industries, as it had done the engineering ones. He also described and contrasted Bessemer's, Siemens', and Bacic processes of production, giving the reasons for the adoption in certain places of one particular process. He considered the chief point in favour of the Siemens process lay in the fact that the amount of carbon could at any time be ascertained without delaying the process, and so allow for the specification on that point being exactly carried out. In conclusion, he referred to the evil of faulty specifications for mild steel work, and recommended that a certain percentage of carbon should be asked for, and tests made to see that it had been got.

An Example for the Restorer. The Society for the Protection of Ancient Buildings has just restored the dilapidated tower of Clare Church, Suffolk, and it is a good example of what restoration, in capable hands, is capable of. The inside rubble and flints were removed bit by bit and replaced by the best Portland cement and the same flints; while now and again bonds of the hardest Staffordshire blue bricks and tiles were inserted, leaving the outside wall just as it was 700 years ago. Viewing the renovated structure from the outside at the present moment, few would believe that the restoration had been completed, and that the tower had been practically rebuilt from the inside. It is a matter of satisfaction that a new strong tower—yet the old one with all its historic memories—will be handed down to posterity in all its ancient beauty.

Our Centre Plates. The construction of the City and South London Railway Co.'s new station in Lombard Street necessitated the underpinning of St. Mary, Woolnoth Church, and is an engineering feat of very great interest and skill. The church is at the angle of King William Street and Lombard Street, and faces the open space in front of the Mansion House. The building is in Portland stone, with granite base. A new screen wall, with entrance gates to the church, is carried along to the front of the west wall to hide the roofs of the entrances to the booking hall, which is under the roadway and the front entrance of the church, the waiting rooms and lifts being under the church itself. The lift shaft is 73ft. 6in. by 24ft., and has lifts each capable of holding 350 passengers. The lines are 100ft. below the street. The work of supporting the church has been done without the slighest damage to the structure, and no person would know from the inside of the church that any alterations had taken place. The carvings in the gables at the sides of the pediment represent electricity and commerce. The iron railings and gates in front of the church have been specially designed by the architect to suit the character and period of the church. The fittings inside the church will be replaced as they formerly existed, and the whole interior redecorated and lighted with electric light. Messrs. J. Mowlem and Co. were the contractors and Mr. Sidney R. J. Smith, F.R.I.B.A., is the architect.—The church of St. Michael, Bournemouth, was built some years ago from the designs of Mr. Norman Shaw, R.A. A tower was not then contemplated, but the need of one has been long felt, and Mr. J. Oldrid Scott was asked to prepare a design last year. The work was begun in due course, and the tower is now making good progress, and promises to be a conspicuous feature in the Poole Road, where the church is situated. The full height will be about 120ft., and the cost approaches £5,000. The design has received Mr. Shaw's full approval. The work is being admirably carried out by the contractors, Messrs. Bowman and Sons, of Stamford.—The Royal Assembly Hall Buildings, South Shields, are situated near the railway station, and comprise two hotels, range of shops, with offices over, and a large assembly hall that has seating accommodation for 2000 persons. The architect is Mr. J. H. Morton, F.R.I.B.A., of South Shields.—The houses on Lenton Boulevard, Nottingham, were built with red sand bricks, the roof is covered with red tiles, the windows are glazed with lead lights, and the exterior paint generally is white. The interior is fitted up in the general design of the period, which is indicated by the exterior work.

Correspondence.

MODEL ANSWERS TO EXAM. QUESTIONS.

To the Editor of The Builders' Journal.

Kirkcaldy.

Sir,—Referring to my letter in last week's issue and to your editorial note, my point is: that *model* answers to exam. questions should not only be unmistakably clear and concise, but complete; and should impress the examiner that the student has grasped the exact nature of the question set before him, *and should answer no more than is asked.*

I am aware that the authors suggest inverted arches, but why not stop there, instead of "beating about the bush" with all these doubtful apprehensions and indirect answers, when—at least to my mind—as I said before, the question seems sufficiently clear to judge the remedy hinted at?

D. FORBES SMITH, A.R.I.B.A.

[Unfortunately, examination questions are not always models of clearness, and we are still unable to see that our contributors could have dealt more usefully with the question set.—Ed.]

THE USES AND LIMITS OF PERSPECTIVE.

To the Editor of The Builders' Journal.

London, W.C.

Dear Sir,—There appeared on page 128 of No. CCXLIII of your journal an interesting article under the above heading, signed G.A.T.M., in which the writer comments rather slightingly on perspectives. "The note to be sounded in regard to perspectives is one of caution and distrust," he says. I don't think this is altogether warranted. Perspectives have been improving now for a number of years, and the "utterly false" type mentioned is fast disappearing before the efforts of such men as Mr. L. W. English, Raffles Davidson, and similar workers. Looking back at the class of perspective representations of, say, fifty years ago, one is soon convinced of this fact. The improvement also in the various processes of reproduction has increased the value of drawings, and it can now be expected that a delicate sky will receive satisfactory treatment. As to the uses of perspective, it is scarcely possible to dispense with the rough perspective sketch of first ideas for a proposed building. In preliminary sketches, a perspective view taken from the plan, and a rough sketch made by the architect, accompanied by a plan, would be preferable to plan and elevations, because geometrical drawings do not give so good or so correct a general idea of a design as a perspective drawing (which shows two elevations at the same time). Projections are lost in elevation even when shading is used.

Another and recognised use occurs when geometric drawings have been submitted for the first time to a client who is undecided whether to proceed with the work, abandon the idea, or defer the matter. A perspective sketch often brings things to a satisfactory climax, and the work proceeds. The sketch need not be expensive, as it will serve its purpose if only in pencil. Then there are competition perspectives. If the first two designs in a competition are of equal merit, but one has a perspective and the other has not, the former will invariably win; in fact, it is not safe to send in for competition without a perspective. Committees usually expect to see one, and such a view is generally included in the list of drawings to be sent in. I remember one competition committee recently required four perspectives, two interiors, two exteriors, and no elevations. This is a large and costly order, and one which considerably reduces the number of competitors. Perspectives are also used for exhibition purposes. Here the Royal Academy takes the lead. The fact that this institution exhibits a large number of perspectives every year shows that their "artistic merit" claims some attention. Perspectives, in fact, may be designs just as much as pictures with landscape or figure subjects. Exhibitions of this sort show the prevailing tendency in architectural style, but it is difficult to separate this class of drawings from the advertisement class.

Another important use is "in showing the designer where improvements could be effected." There are few who will not recognise demerits in a correctly set out perspective which would pass unobserved in a geometrical drawing. I have known architects of repute alter features and make additions to important buildings, in which case a good perspective has been desirable.

With regard to "wholly fanciful drawing of surrounding scenery," the better artists take very great pains to show the surroundings as correct as possible, which never fails to localise a drawing, and often makes it much more interesting. "Impossible points of view" are not very common, and generally occur where the streets are narrow. Intervening objects have often to be ignored in order to completely show the building. I admit that "cooked" perspectives are in every way despicable.—Yours truly,

C. HENZELL-ASCROFT.

New Patents.

The following abridged description is specially drawn up for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

6577. Roofing Tiles.—Patentee: S. Buck, of Osborne House, High Road, Loughton, Essex. In order to prevent the sagging of ridge tiles, they are formed with rabetted side edges, or a tongue of one tile enters a groove of the adjacent tile. The lower edges of the ridge tiles are grooved or recessed to engage with ribs or tongues at the upper edges of the tiles below.

6711. Stoves and Fireplaces.—Patentee: E. Taylor, of Blakey Moor, Blackburn. In the bottom of an open fire-grate is placed a block consisting of a number of slotted and perforated discs bolted together. The block serves as a fuel economiser, and allows air to circulate and ashes to pass through to the ash-pan.

593. Moulding Bricks.—Patentees: Blackman Ventilating Co., W. W. Wardle, and W. Tattersall, all of Fore Street, London, E.C. The cut bricks from the cutting-table of an extrusion machine are received by a number of boards connected by slotted links, so that the bricks are separated when the boards are pulled apart. The boards are mounted on V-shaped guide-rails that are slid transversely by a foot lever and toggle links in order to move the bricks clear of the cutting frame. The bricks are pushed by a board off the sections or boards on to a carrying-off board, and are carried to suitable drying chambers.

25,862. Doors, Shutters, &c.—Patentee: D. H. Ferguson, Board of Trade Building, Montreal, Canada. Asbestos fibre is mixed with silicate of soda into a pulp, which is moulded into halves of doors, with panels and rails. These sides or halves are dried and immersed in calcium chloride, or the like, to decompose the silicate of soda and cause it to set. After drying, the sides are cemented together. A modification for an outside door is illustrated in the drawings accompanying the specification. Distance pieces and strips are interposed between the sides, and the space between is filled in with asbestos fibres or other incombustible material. The locks and fittings are secured to solid filling pieces. Doors, wainscotting, &c., may be constructed of strips and sheets of asbestos millboard, treated with silicate of soda and calcium chloride.

Professional Practice.

Bristol.—A new stone reredos has been erected in Bristol Cathedral at a cost of £2,500, from designs by Mr. J. L. Pearson. It is about 17ft. wide and 27ft. high. The lower part behind and above the altar is plain, with a tall centre panel to enclose the altar cross, and on each side of the upper half of this panel is an enriched arcade of five divisions. The centre portion is corbelled boldly forward, and to the right and left there are enrichments from the floor upwards of traceried panelling, surmounted by niches with figures of Biblical saints. Above the level of the top of the corbelling the reredos contains niches, the central one having the Crucifixion, with Saint Mary and Saint John, well sculptured. The lower part of the back or eastern side of the reredos is richly panelled to a height of 14ft., and above this it is divided up by buttresses with niches. A panelled and traceried screen separates the eastern bay of the choir from its eastern chapel, flanking the reredos on either side. In front of the reredos stands an elaborate altar table of carved oak, surmounted by a marble slab, and approached by three steps.

Cambridge.—The new Presbyterian Theological College at Cambridge that was opened with enthusiasm on October 17th has been designed by Mr. Henry Hare, and has cost about £42,000. The site is at the junction of Queen's Road and Madingley Road, and the college, with the professors' houses and surrounding gardens, occupies about three acres of ground. Over the entrance gates are the dates 1844 and 1899, commemorating respectively the foundation of the college in London and its removal to Cambridge. The building consists of a central dome-capped block flanked by two wings. The central building contains the library, with space for 20,000 volumes, the lecture-rooms, offices, &c. In the west wing is the principal's lodge; in the east are rooms for twenty-five students and a resident tutor. In addition, two houses for professors are being erected to the north-west of the lodge. The foundation-stone of the new building was laid in May, 1897, and it has thus taken considerably over two years to erect. Like Mansfield, Westminster College will be one exclusively for theological students; but, unlike the Oxford foundation, it will be also a residential college.

Douglas.—The new town hall that has been erected from designs by Mr. Arthur Ardron, F.R.I.B.A., will have cost, when quite completed, about £12,500, but this amount does not include the furnishing. The contract for the building work was let to Messrs. W. Gradwell and Co., of Barrow-in-Furness, for £10,358. Local stone has been used for the outer walls, with Bath stone for dressings. The building is divided into three parts—the municipal offices, a free library, and a fire station—each part being complete in itself, but communicating internally to facilitate intercourse between the different departments. The main entrance to the municipal buildings in John Street is surmounted by a massive piece of ornamental work in Bath stone. The vestibule is guarded by a pair of wrought iron gates, designed and made by Jones and Willis, of London, and decorated in an effective manner in black and gold, each gate having a scroll bearing the three Legs of Man in gilt. The usual accommodation for the municipal offices is provided in this part of the building. The council chamber is 42ft. by 32ft., with a barrel ceiling panelled in fibrous plaster. All the woodwork is of Stettin oak. The library is heated throughout by low pressure hot-water pipes, fitted by Mr. W. F. Spencer, of Oldham, and ventilation is provided by Pickup's patent system with inlets in the lower walls for the fresh air, and outlets in the ceilings for the vitiated atmosphere. On the ground floor of the Fire Brigade section accommodation is provided for the fire appliances, above there is a large assembly room, and on the third storey are situated the caretaker's rooms.

Howth, Co. Dublin.—The new Roman Catholic Church of the Assumption, which was recently dedicated, is in the Romanesque style, and comprises nave, tower, two transepts with entrance porches, sanctuary, two side chapels, and sacristies. The nave is 85ft. long, and 32ft. 6in. wide; and each of the transepts is 18ft. in length, by 29ft. in width. The transepts on each side of the nave are divided from it by an arcade of deeply moulded arches, supported on columns of polished red Aberdeen granite, with carved caps and moulded bases. The nave is lighted by lancet windows on each side, and has a handsome circular window in the gable. The ceilings of the nave, transepts, and sanctuary are of Norfolk pine, and are divided into panels by moulded horizontal and vertical ribs. Four trusses support the apse roof. As to the exterior, the tower and spire when complete, will reach a height of 142ft., and will be surmounted by a cross. The sides are divided into bays by pilasters between the windows; and the porches have entrance doors with moulded arches, jambs, and labels over. The cut stone work is of Aughrim and Kilquiggan chiselled granite; and the walls have been executed in local stone, lined inside with Portmarnock brickwork. The stonework has been carried out by Mr. Wm. Lacy, of Howth. The materials for the roofing and other woodwork were supplied by Messrs. T. and C. Martin, Dublin. The plastering was done by Mr. W. J. Burke, Dublin, and the windows, with one exception, were supplied by Messrs. Martin and Sons, Stephen's Green. Mr. William B. Byrne, F.R.I.A.I., was the architect.

Leeds.—Among the many building improvements which are claiming attention in Leeds at the present time, the new Victoria Arcade in the centre of the city constitutes an important and attractive feature. It is arranged in the shape of a letter L, with entrances in Upperhead Row and Land's Lane, and provides for twenty-six shops, each with a show room overhead. A somewhat striking appearance is given to the buildings by a dome over the angle, where the arcade is at its widest. The footway is laid with Venetian Mosaic, and beneath is a subway containing the sewers, water-pipes, and electric lighting and gas mains. Four incandescent electric lights, each of 1,000 candle power, will serve to illuminate the arcade. The work has been performed by several contractors to the design of Messrs. Thomas Ambler and Son.

Thetford.—On October 18th the Reconstruction Committee of the Thetford Town Council met to finally consider the modified plans of Mr. Green, the architect, for the alterations to the Town Hall. After lengthy consideration they were passed, and it was decided to proceed with the work forthwith. The necessity of taking the old walls down has led to certain modifications being introduced, which will add considerably to the utility and appearance of the building. The floor of the large court will be raised 2ft., the approach from the market place will be by a flight of stone steps, with a porch at the top, supported upon stone columns, and the part of the basement which formerly consisted of a a number of small cells, will now be converted into a room 42ft. by 27ft. The last named can be used as a drill hall for the local volunteers. The Fire Brigade will have their quarters, as previously, in the west end of the building, and the mayor's parlour and the mechanics' institute will be preserved intact. In the large court, the floor space of which will be increased, the decoration will be improved by a handsomely carved ceiling. The council chamber will be above the Fire Brigade depôt, and there will be a passage from the large court under the gallery to the chamber. New magistrates' rooms, and improved kitchens and scullery, complete the list of the principal changes. The county court will be on the site of its predecessor, and will be surmounted at the centre by a clock tower with illuminated dials. The whole of the buildings will be carried out in white brick, with stone dressings.

Warwick.—Guy's Cliffe, near Warwick, the seat of the Right Hon. Lord Algernon Percy is situated a mile and a half along the celebrated high-road from Warwick to Kenilworth Castle. The mansion stands on the banks of the river Avon, and is surrounded by some of the most picturesque and beautiful scenery in the Midlands. It is of much historic and legendary interest. In the sixth century St. Dubritius built an oratory here, and the mythical exploits of Guy, Earl of Warwick, are interwoven with the history of the place. In later times Henry V. visited Guy's Cliffe and determined to establish a chantry, which was subsequently done by Richard Beauchamp, Earl of Warwick. An interesting theatrical romance is associated with Guy's Cliffe in connection with Sarah Kemble, afterwards known as Mrs. Siddons, the great tragedienne. A charming avenue of silver firs fronts the house, and the old Saxon mill, so much admired by artists (including Mr. Ruskin), is close by. The interior of the house contains a very good collection of pictures, many of them by celebrated painters. A new wing and extensive alterations have just been completed at the mansion, from designs by Messrs. Mark H. Judge and Sons, of 7, Pall Mall, London, W. The addition which has been made in the courtyard is built of Warwickshire stone, with Hollington stone dressings. On the ground floor a new entrance hall has been provided, with a unique fireplace carved out of the natural rock. Parquetry flooring in the various rooms has been laid by Messrs. Damman and Washer and Co., of Brussels; hot-water services have been fixed by Messrs. W. Boulting and Co., of London; passenger and luggage lifts by Messrs. R. Waygood and Co., of London; sanitary specialities by Messrs. J. Bolding and Sons, of London; and gas standards, pendants, &c., in hammered art metal, by Messrs. A. R. Dean, Ltd., of Birmingham. The clerk of works was Mr. Guy Wilfrid Hayler, and the contractors were Messrs. G. F. Smith and Sons, of Royal Leamington Spa.

Keystones.

The first Woman to secure the Royal Academy Gold Medal was Louisa Starr, now Madame Canziani.

The Works of James Maris form the chief feature at the exhibition now open at the Goupil Gallery, in Regent Street, W.

New Partnership.—A partnership has been arranged between Mr. Percy T. Remton, architect, of Hull, and Mr. W. S. Barry, architect, of Scarborough, which will be carried on under the style of Remton and Barry, at Hull and Scarborough.

A New Presbyterian Church at Limerick, the foundation stone of which was recently laid, is being erected from designs by Mr. G. C. Ashlin, of Dublin, at an estimated cost of £6,000. Messrs. J. Ryan and Sons, Limerick, are the builders.

Durham College of Science.—From the second annual report that has been sent to us we learn that Mr. M. Walton Brown has been re-elected president of the Durham College of Science Old Student's Union, and that there is a balance in hand of £14 13s. 10d.

The Smoke Nuisance in Paris.—A writer to a contemporary states that as so much coal is now consumed in Paris, not only statuary but public buildings are fast approaching the dinginess of those in London. This is especially noticeable at the Louvre.

The Roman Pavement at Dorchester.—At a meeting of the committee appointed to take steps for acquiring the splendid specimen of Roman pavement recently discovered at Dorchester, two schemes were brought forward—one for purchasing the pavement and adjoining houses at a cost of £1,500, the pavement to remain *in situ*, and the other to take up the pavement and relay it in the County Museum, at a total cost of £700. The latter received most favour, and it was decided to make an appeal to the county for the necessary funds.

A New Library at Hornsey, N., was opened on Saturday.

New Premises for the Blackpool Liberal Club have been built in Victoria Street at a cost of £8,500.

Mr. Arthur Evershed has been elected hon. treasurer, and Mr. Cloudesly Brereton secretary, of the Royal Society of Painter-Etchers and Engravers.

A Lady Sanitary Inspector is about to be appointed at Poplar, E. The Local Government Board have at last given their sanction to the proposal.

Mr. H. G. Watkins has taken over the honorary secretaryship of the Nottingham Architectural Society, in place of Mr. R. Evans, jun., the late hon. secretary.

Additions to the Royal Technical Institute, Salford.—Two additional rooms, for spinning and weaving, have been added to this institute and were opened on October 20th.

Church Bells have recently been the subject of several letters to the "Times," and the chief opinion expressed was that the only right way is to build the frames of iron fast into the walls.

Cost of the Paris Exhibition.—The French Government are spending four millions of money on the Exhibition, and foreign nations two millions. It is estimated that in all there will be about 150 million visitors.

A Generous Decision.—The City Corporation have decided to erect, at a cost of £10,669, a shelter in Golden Lane for the reception of families whose houses are being disinfected after outbreak of disease.

The Nelson Column in Trafalgar Square was attractively decorated last Saturday with floral wreaths and incandescent lamps. Messrs. J. W. Gray and Co., the steeplejacks, carried out the work of preparation.

A new chimney at Falkirk that has just been completed for the Falkirk Brewery Company is 200ft. high, and has a diameter of 17ft. for the first 70ft., and from that part tapers to 10ft. 6in. at the top.

Death of a Great Organ Builder.—The greatest of French organ builders, and one of the most distinguished members of his craft in the world, has recently died, at the age of eighty-eight. Aristide Cavaille-Coll built the organs at St. Denis, at Notre Dame, at the Madeleine, where Saint-Saens so long was organist; at the Trinite, at Notre Dame de Lorette, at the Trocadero, at Versailles, and at the Cathedrals of Nancy, Nimes, Saint-Omer, Porpignan, and Ghent. He also built organs at Sheffield (the Albert Hall organ), and other English towns, including the fine instrument which a year or two ago was destroyed by fire at the Colston Hall, Bristol.

The N. A. P. Window Company (Limited).—Under the compulsory winding up of this company the adjourned meetings of creditors and shareholders were held last Friday at the Carey-street offices of the Board of Trade, Mr. H. Brougham, Official Receiver, presiding. The statement of affairs showed liabilities £13,986, of which £8,957 were expected to rank for dividend, and assets £3,992, after deducting £4,931 for claims of debenture-holders. The chairman reported that the meeting stood adjourned on two previous occasions to enable an offer to be submitted. Since the last meeting, Mr. Tilley, the receiver for debenture-holders, had received from the Express Contract Company an offer for the assets. It was proposed to allot to the creditors of the old company fully-paid shares in the new N. A. P. Window Company of the face value of their proved claims. As regarded the debenture-holders, the Express Contract Company were prepared to pay in respect of each £5 debenture £2 in cash and £3 by the allotment of fully paid "B" cumulative preference shares of £1 each in the Express Contract Company. The debenture-holders had already assented to the arrangement, subject to the approval of the Court. Resolutions were passed accepting the offer and appointing Mr. A. A. Yeatman, chartered accountant, as liquidator to carry out the sale.

Norwich Grand Theatre and Opera House.—The contract for this building, which is to be erected on the old Norfolk Hotel site, has been let to Messrs. J. Youngs and Sons, of Norwich. It is estimated that the total cost will amount to about £40,000.

The Technical High School of Berlin celebrated its hundredth anniversary on October 19th, when the Emperor, in the course of his speech, laid stress on the equality of rank in which technical high schools stood towards the universities.

The Sinking Town of Northwich.—In the course of a Local Government Board inquiry on October 19th into the application to borrow £30,000 for sewerage purposes, it was stated that during the past twenty-two years the town of Northwich proper had sunk 7ft. 2in. on account of the brine pumping.

More Modern Church Building.—St. Andrew's Church, Chew Stoke, Somerset, is badly in need of repair, and the diocesan architect, Mr. Buckle, reports that the foundations were insufficient, causing a settlement of the building. The church is only about fifty years old.

The West Ham Technical Institute, which was opened about a year ago, and cost £70,000, was burned out last Monday morning. Messrs. Gibson and Russell were the architects, having won the first premium in the well-known competition. The damage is fully covered by insurance.

A Big Error.—The original estimate for the new lunatic asylum now being built at Warlingham was £140,482. The amended estimate now presented amounts to £199,125—a difference of £58,643! Application will have to be made to the Local Government Board for sanction to borrow this amount.

The Edinburgh Architectural Society opened the session on Wednesday, the 11th inst., with the annual business meeting. The following officials were elected: President, Mr. Alfred Sveig; vice-president, Mr. Percy E. Nobbs, M.A.; librarian, Mr. John F. Matthews; treasurer, Mr. A. Hay Lamont; joint hon. secretaries, Mr. Andrew Muir and Mr. Colin Cownie.

The Annual Conversazione of the Architectural Association was held at the Holborn Restaurant, on Friday evening, when the guests were received by the president, Mr. G. H. Fellowes Prynne, and Mrs. Prynne. The exhibitions of the students' prize drawings in the water-colour and colour decoration classes, and of some remarkable photographs and designs, were a source of much interest. The Association was founded in 1847, and now numbers over 1,300 members, the architectural instruction that it provides being the most complete that is to be obtained in the United Kingdom.

Ceramic Panels for Exterior Decoration.—At St. Margaret's Mission Church, South Coburg Street, Glasgow, Messrs. Doulton and Co. have sought to carry out on a stoneware basis the method of decoration known as majolica painting. The hard stoneware body is covered with an enamel that can be fired at the same heat as the body and in the same kiln. It is anticipated that paintings fused at such an intense heat will be able to permanently withstand the deleterious acids found in city atmospheres. Ordinary tile paintings have been found to be not always satisfactory as regards permanence.

Faringdon House, Faringdon, Berkshire, a house much associated with Oliver Cromwell, is now being extensively altered, and will shortly be completed. The house is soon to be the residence of Mr. Thomas Kingscote and the Hon. Mrs. Kingscote, of St. James' Palace. A new system of water supply, together with a new scheme of sanitary arrangements, have been carried out, and considerable structural alterations have been made to the house itself. Messrs. Mark H. Judge and Sons, of 7, Pall Mall, are the architects and engineers, and Mr. Guy Wilfrid Hayler is the clerk of works. Messrs. Cadel Bros., of Faringdon, are the contractors.

New Companies.

Rennie's Lead Syndicate, Limited.

This company was registered in Scotland the week before last with a capital of £3,000 in £1 shares, to adopt an agreement with W. G. Rennie, engineer, 6, Gillespie Street, Edinburgh, and to carry on the manufacture of lead traps and piping.

Edgar Vaughan and Co., Limited.

This company was registered on October 11th by Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £4,000 in £1 shares, to carry on business as manufacturers of and dealers in rust preventers, varnishes, lacquers, paints, colours, dyes, oils, cements, pigments, chemical compounds, brushes, tinware, &c. The directors are to be elected by the signatories. Qualification, £50. Remuneration to be fixed by the company.

House and Garden Estate Company, Limited.

This company was registered on October 13th by Messrs. Hudson and Kearns, 83, Southwark Street, E.C., with a capital of £15,000 in £10 shares, to acquire and turn to account any lands or estates by planting, farming, or building thereon; as market gardeners, miners and smelters, builders and contractors, dealers in stone, sand, slate, lime, bricks, timber, &c.; as coal and salt merchants, advertising agents, jobmasters, licensed victuallers, carriers by land and water, ironmongers, printers, &c.; to construct and maintain gas and electric works, shops, stores, &c.

Dove Holes Brick Company, Limited.

This company was registered on October 16th, by P. G. Robinson, Temple, with a capital of £8,000 in £10 shares, to adopt and carry into effect agreements made by this company with J. S. Marchington and J. Marchington; to acquire certain land at or near Dove Holes, in the county of Derby, and to carry on business as brick, tile, and terra-cotta manufacturers, artificial stone makers, miners and smelters, metallurgists, &c; as general carriers, builders, merchants, coal merchants, &c.; and to acquire and turn to account any patents, patent rights, &c.

W. H. C. Walker, Limited.

This company was registered on October 6th by G. N. T. Haslam, with a capital of £5,000 in £1 shares, to carry on the general business of a builder and contractor, brick, tile, and terra-cotta manufacturer, as now and hitherto carried on by W. H. C. Walker at Brickkiln Street, and Heath Town, Wolverhampton; to develop and extend the said business, and with a view to the above objects or any of them; to adopt and carry into effect an agreement expressed to be made by W. H. C. Walker of the one part, and this company of the other part; to lay out land for building purposes; to undertake and carry on all kinds of agency business; to acquire and turn to account any patents, patent rights and inventions, machinery, &c.

Suburban District Investments, Limited.

This company was registered on October 11th by W. H. M. Dyson, 19, Tubbs Road, Harlesden, N.W., with a capital of £10,000 in £1 shares, to acquire and turn to account, in such manner as the company shall see fit, any lands, buildings, flats, and hereditaments of any tenure or description in the counties of London or Middlesex; as builders and contractors, decorators, merchants, and dealers in building materials; as stock and share dealers, estate managers, &c.; and, with a view to the above objects, or any of them, to adopt an agreement made by this company with F. J Loveday and W. H. M. Dyson. The directors are E. Bishop, W. H. M. Dyson, and F. E. Fellows. Qualification, £100. Remuneration, a percentage of the profit.

COMING EVENTS.

Wednesday, October 25.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstration at East London Soap Works, Bow, E. 3 p.m. H. D. Searles Wood, F.R.I.B.A., on "Building Materials." 8 p.m.

Thursday, October 26.

Worshipful Company of Carpenters.—(Lectures on Sanitary Building Construction).—Mr. Thomas Blashill on "Sanitary Construction." 7.30 p.m.

Friday, October 27.

Architectural Association.—Mr. Lawrence Harvey on "The Construction of Circular Stairs and Spiral Vaults." 7.30 p.m.

Sanitary Institute.—(Lectures for Sanitary Officers.)—Mr. Percival Gordon Smith, F.R.I.B.A., on "Sanitary Building Construction." 8 p.m.

Institution of Mechanical Engineers.—Ordinary general meeting. (1) Mr. William Ingham on "The Incrustation of Pipes at Torquay Water Works. (2, if time allows) Professor William Ripper on "A Continuous Mean-Pressure Indicator for Steam-Engines." 8 p.m.

Glasgow and West of Scotland Technical College Architectural Craftsman's Society.—Mr. Alex. Wagstaff on "My Impressions of Glasgow Cathedral." 8 p.m.

Saturday, October 28.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at the Richmond Main Drainage Works, Mortlake, at 3 p.m., conducted by Mr. William Fairley, A.M.I.C.E.

Monday, October 30.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers).—Mr. George Reid, M.D., D.P.H., on "Sanitary Appliances." 8 p.m.

Tuesday, October 31.

Royal Society of Antiquaries of Ireland.—Meeting at Dublin. 8.15 p.m. (1) Mr. Henry F. Berry, M.A., on "Ancient records of the Dublin Guild of Merchants, 1438-1671." (2) Mr. F. Elrington Ball, M.R.I.A., on "Monkstown Castle, near Dublin, and its History." (3) Mr. F. J. Bigger, M.R.I.A., on "The Antiquities of Inchcleraun in Lough Ree, co. Longford."

Wednesday, November 1.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration in the parish of St. George, Hanover-square, at 2 p.m., conducted by Mr. Albert Taylor, chief sanitary inspector. J. Wright Clarke on "Details of Plumbers' Work." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of members. 8 p.m.

British Archæological Association. — Opening meeting of session at 8 p.m.

Thursday, November 2.

Worshipful Company of Carpenters.—(Lectures on Sanitary Building Construction.)—Mr. Keith D. Young, F.R.I.B.A., on "Principles of Ventilating and Warming Buildings." 7.30 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BIRMINGHAM.—For the erection of new depôt, public offices, etc., Stratford-road, Sparkhill, for the Yardley Rural District Council. Mr. Arthur Harrison, architect, Queen Chambers, Colmore-row, Birmingham. Quantities by Mr. Anthony Rowse, 3, Newhall-street, Birmingham:

Harley and Son ...	£11,545	Whitehouse and Sons	£10,986
Moffat and Sons ...	11,380	Whittall and Son ..	10,860
R. Fenwick	11,095	F. Davis...	10,782
F. J. Briley	11,085	W. Bishop, King's Heath (accepted) ...	10,687
Bowen and Sons ..	11,065		
H. Gibbs	11,029		

BRIGHTON.—For the erection and completion of a pair of semi-detached villas in the Tivoli-crescent, Dyke-road, Brighton, for Mr. F. J. Foulger. Mr. H. M. Nye, architect, 47, Hova-villas, Hove:—

H. J. Penfold	£1,817	S. C. Smale	£1,384
W. Humphrey	1,600		

BURTON-ON-TRENT.—Accepted for the erection o No. 2 block of artisans' dwellings, for the Burton-on-Trent Artisans' Dwellings Company, Limited. Mr. Thomas Jenkins, architect, 35, High-street, Burton-on-Trent. Quantities by the architect:—

Henry Edwards	£3,937 10

GREAT YARMOUTH.—For the erection of a mariners' chapel, institute, and house, for the British and Foreign Sailors' Society. Messrs. Bottle and Olley, architects, Great Yarmouth:—

For the Whole of the Works, Exclusive of Plumber, Painter, Gas, Heating, &c.

HIGHLY GLAZED SANITARY STONEWARE PIPES, TRAPS, GULLIES.

J. C. EDWARDS RUABON. TERRA-COTTA WORKS

STABLE BRICKS and CHANNELS, CATTLE BOOZIES and MANGERS.

THE HATHERN STATION BRICK COMPANY'S

TERRA-COTTA AND BLUE BRICKS.

Colours: DEEP RED, TERRA-COTTA, BISCUIT, TAWNY, and GOLDEN BUFF.

THESE **Terra-cottas** are manufactured from the finest of Clays, specially blended and prepared by the Company's process, and are **fired at such intense heats** as to produce the hardest imperishable material. The Blocks are true to line and dimensions, and the Architect's ideas are faithfully carried out. Every Block is of exactly the same material throughout, the face is the natural clay itself, and absolutely no facing preparations are used. All details furnished are re-drawn to full size to the proper shrinkage scale for each material, and large scale plans are supplied for fixing free of charge.

References will be furnished to many fine buildings designed by Architects of eminence, for Public Purposes, Railway Companies, and Private Owners; and samples of the material and estimates will be forwarded on application.

The BLUE BRICK WORKS are at CLIFF, near TAMWORTH, STAFFORDSHIRE.
The TERRA-COTTA WORKS and OFFICES are at HATHERN STATION, on the Midland main line, near LOUGHBOROUGH, LEICESTERSHIRE.

FIREPROOF CONSTRUCTION IN AMERICA.—II.

BY J. RAWSON GARDNER, of Montreal.

(*Concluded from p. lxvii., No. CCXLIII.*)

IN the first portion of this article several forms of fireproofing by means of concrete construction were illustrated and described. In this portion hollow tile construction will be dealt with. The use of hollow tiles for fireproofing purposes was coincident with the introduction of rolled I-beams—the first beams being rolled in America, at the Trenton works, in 1854, and the first patent for hollow tiles for fireproofing being issued in 1855 to F. A. Peterson, an American (see Fig. 1). Following this, in 1858, an Englishman, Joseph Bunnett, was granted a patent for both a side and an end construction arch. In this system, angle irons were set in the walls, tied at the upper end with tie rods, the arch springing segmentally from wall to wall. The form of voussoir used is shown at Fig. 2.

Fig 1

Fig 2

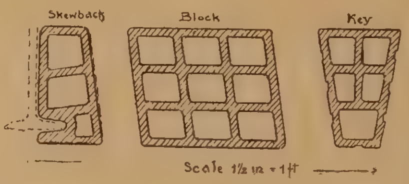

Fig 6

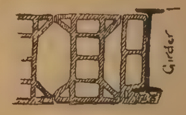

Fig. 11.

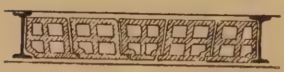

Fig. 3.

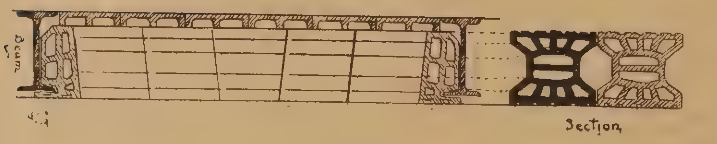

Fig 4

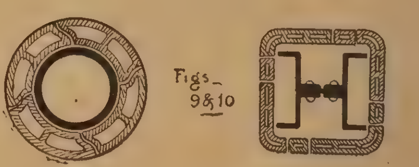

Figs 9&10

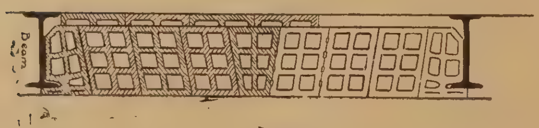

Fig 5

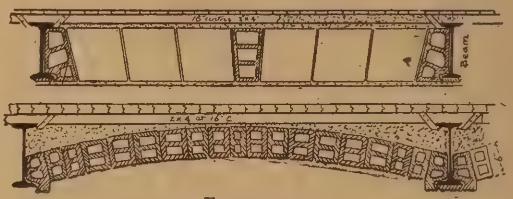

Figs. 7&8.

The next important change was made in 1867 by a Frenchman, Vincent Garcin, who took out a patent for what is considered the first flat hollow tile arch with voussoirs, similar in most respects to those in use at the present time. It should be noticed, however, that there is no covering to the lower flange of the beam, plastering being the only protection. This arch is illustrated at Fig. 3. Since then several systems have been placed on the market with more or less changes in minor details and with varying success, and some of these which are in use at the time of writing will be illustrated further on in this article. When studying the question of the most desirable form of hollow tile construction, one has to consider the question of "end pressure" *versus* "side pressure," besides the respective merits of hard, semi-porous, and porous material for the arch. In reference to cost, it would be well to bear in mind also that economy of floor construction is not merely in the material, but also in the disposition of the beams. As a general rule it may be taken that a close arrangement of columns is the most economical, but even with the same spacing of columns the possibility of variation in designing the framework of girders and beams is far greater than is commonly imagined.

It should be remembered that fireproofing a building is somewhat the same as building a fence—it is almost useless unless complete. One column left unprotected is like a fence with the gate left open. There are far too many buildings only partly fireproofed that are designated as fireproof buildings, which, when put to a severe test, collapse. These buildings have given the general public the impression that the extra cost of fireproofing may be doubtful gain, and it is hard, in the face of facts during the past, to blame them. Architects should be careful of their own reputation and not allow a building to be called a fireproof structure unless entirely so in every detail. The public, however, on their part should remember that the contents of a building are almost always inflammable, and when stored in a warehouse or departmental store where a large area of open floor space is exposed to the flames, the loss to the contents is sometimes larger in a fireproof building than in one that is not fireproof. In the latter case, the floors fall in and the contents are thrown into the cellar and covered over with bricks, mortar, and other *débris*, and in this manner are oftentimes protected. In the fireproof building the contents may burn out, as each floor, if not partitioned off in any way, acts as a large oven; the contents burn themselves out, but the building is not, or ought not to be, seriously damaged.

One weak point which seems to be so much neglected is that of the large plate glass windows almost universally used in large stores. These break when subjected to high temperatures from a conflagration in adjoining or opposite buildings, and the contents immediately ignite, starting what oftentimes becomes a large fire. If these windows were carefully protected by means of asbestic (or other fireproof material) curtains, many serious fires would be prevented.

In considering the different systems of fireproofing by means of hollow tile construction, let us take the forms of floor arches, &c., used by the following firms:—

1. Henry Maurer and Son, of New York.
2. The Central Fireproofing Co., of New York.
3. The Illinois Terra-Cotta Lumber Co.
4. The Pioneer Fireproofing Co., of Chicago.
5. The Fawcett Fireproof Co., of Philadelphia.

1. The form of "end pressure" arch as erected under the Maurer system is shown at Fig. 4, while the "side pressure" arch is shown at Fig. 5.

The following table gives the relative weights of the two different forms for floors of various spaces. By this table it will be seen that the end pressure construction is both lighter and stronger:—

"END PRESSURE."

Width between Beams.	Depth of Arch.	Weight pe square foot.
5ft. to 6ft.	8in.	27lbs.
6ft. to 7ft.	9in.	29lbs.
7ft. to 8ft.	10in.	33lbs.
8ft. to 9ft.	12in.	38lbs.

"SIDE PRESSURE."

4ft. 6in. to 5ft. 6in...	8in.	32lbs.
5ft. 6in. to 6ft. ...	9in.	36lbs.
6ft. to 6ft. 6in. ...	10in.	39lbs.
6ft. 6in. to 7ft. ...	12in.	44lbs.

An 8in. arch "end pressure" system of 8ft. span and 5ft. in length—that is 40 square feet of surface—carried, at a test made by the firm, 50,000lbs. equally distributed, and showed no deflection. This is equal to 1,250lbs. to the square foot. In reference to this subject of strength, Mr. Wight, an American fireproofing expert, in an article in the "Brickbuilder," of Boston, says:—"The actual tests of 'side pressure' arches of the best make have thus far shown that they break at from 500lbs. to 1,000lbs. per super foot, while those for 'end pressure' arches run up to about 1,700lbs.;" and again, "the end pressure system has not entirely supplanted the older side pressure system. It has its advantages when the ultimate weight to be carried on the floors is greater than 400lbs. per super. foot. As long as the rates of effective height to length of span is maintained within one to eight it is only a question of economy which to use." The advantages claimed for the older side pressure system is the greater ease of erecting and the courses break joint, which is not the case, so far, in the end pressure system.

2. The Central Fireproofing Company, of New York, use a side pressure system, illustrated at Fig. 6. This firm has recently issued a table of diagrams giving the allowable loads for semi-porous arches with $\frac{5}{8}$in. webs and shells (side pressure system), worked out on the formula—calculated by them—

$$\frac{280\,AD}{S^2} = W$$

Where A = least cross sectional area of arch 1ft. wide (in square inches).
D = total depth of terra-cotta arch (in feet).
S = span of arch (in feet).
W = safe load per square foot (in lbs.).

3. The Illinois Terra-Cotta Lumber Company make an end pressure arch with *both* skew-

backs and key set longitudinally with the beams, and in this detail it differs from the other forms illustrated. This system is shown at Fig. 7, and a segmental arch at Fig. 8. The tiles for encasing columns, used by this firm, are shown at Fig. 9 and 10, cast-iron and built steel columns respectively. It should be borne in mind that these blocks should be tied to the iron columns by iron ties, as this is a very important detail and one oftentimes omitted by the contractor.

4. The Pioneer Fireproofing Company, of Chicago, use an end construction arch similar to that shown at Fig. 4, but with voussoirs formed as shown at Fig. 11.

5. The Fawcett Fireproofing Company, of Philadelphia, system was illustrated and described fully in No. 226, dated June 7th, 1899, and as it is in use quite extensively in Great Britain, it will be unnecessary to make any further comments, except adding the following two tables, which will show some further details concerning this system. The construction of this floor with tile lintels and concrete filling, which forms a series of small concrete arches, is somewhat similar to the Homan's floor. Special note should, however, be taken of the method employed in this system to obtain an air passage:—

Table showing the Weight of Materials used in Constructing the Fawcett Ventilated Fireproofing System.

Materials used in Floor.	Wt. of floor material per sq. ft. of surface, for various size beams. Depth in Inches.								Materials used in Floor.
	4in.	5in.	6in.	7in.	8in.	9in.	10in.	12in.	
Steel Beams	3.7lb.	5.1lb.	6·9lb.	8.9lb.	10.5lb.	12.2lb.	15.5lb.	19.1lb.	Steel Beams
Lintels	15.0 „	15.0 „	15.0 „	15.0 „	15.0 „	15.0 „	15 0 „	15.0 „	Lintels
Concrete	26.0 „	32.5 „	39.0 „	45.5 „	52.0 „	58.5 „	65.0 „	78.0 „	Concrete
Wood Floor	3.5 „	3.5 „	3.5 „	3.5 „	3 5 „	3.5 „	3.5 „	3.5 „	Wood Floor

Note.—The above sizes of beams are for the finishing floor, including concrete 2 inches above top of beams, yellow pine flooring, and plastered ceiling.

Although the foregoing remarks do not by any means cover the field of fireproof construction in America, it is hoped that by them the reader will gain some idea of the methods usually employed in constructing a fireproof building—one that can withstand a severe fire and water test.

Improving the London Drainage.—A conference of representatives of London local authorities north of the Thames will be held at Paddington Vestry Hall next Friday, at 3 p.m., to urge upon the London County Council the necessity of immediately improving the main drainage system so as to prevent the flooding, during storms, of the low lying districts north of the river.

Masters and Men.

Carpenters' Wages. — The trade-union joiners and carpenters of Chester-le-Street, Northampton, and Dunfermline have just secured an advance of ½d. per hour in their wages; while at Hexham an increase of 1d. has been granted. These advances affect nearly 300 men.

Danish Lock-out Fund.—In answer to the appeal of the London Trades' Council for funds for the unemployed in Denmark during the recent lock-out, the Amalgamated Society of Carpenters and Joiners have made a levy on its members, which has realised £1,200. A cheque for the amount has been forwarded.

Bristol Plasterers' Strike Ended.—With reference to the strike of plasterers, the Bristol Master Builders' Association addressed a letter to the National Association of Operative Plasterers, and were informed by Mr. Dellar, the secretary, that all communications with reference to the strike would have to be made through the medium of the National Association of Master Builders. Accordingly, a representation was made to that body, and a meeting of representatives from Bristol, Liverpool, and London met at Birmingham. The position of matters was fully considered, and six representatives of the plasterers' society met six members of the Master Builders' Association. After the conference a settlement of the strike was signed on Saturday. The masters have practically conceded what the men required, and work is to be resumed to-day.

A Strange Proposal.—The strike of miners in the Spring Valley, Illinois, is naturally attracting considerable attention in the United States. Trans-Atlantic employers are tolerably familiar with the pretensions of the modern trades unionist, but they are staggered by the latest demand put forward on behalf of the Illinois pitmen. That demand, to enforce which some thousands of coal miners have struck, is that the employers should deduct the men's contributions to the labour organisations from their wages, and hand the cash over to the officials of such bodies. This the employers decline to do. It is not surprising that they should refuse to play the part of collectors for the funds of societies which are avowedly hostile to their interests.

A Coke Famine in Western Pennsylvania, U.S.A., is now prevailing, and unless relief is soon found the iron furnaces will have to bank their fires. The available supply of pig-iron, which has been continually diminishing lately, has now almost reached the low-water mark, and this fact is adding to the troubles of the furnacemen. The price of iron is now so high as to be in many cases almost prohibitive. The Carnegie-Rockfeller fight for the traffic of the Great Lakes has become a fight also to secure iron ore mines on the lake shores. This has caused the mine-owners to raise their prices, with the result of further increasing prices all along the line.

The Hull Building Trade Dispute.—The report that Mr. W. G. Bray, president of the Masters' Association, was amongst the members who had dissociated themselves from the policy of the majority of the members of the Association, and had called his men back, is untrue; in fact, the Association seems likely to win the fight. At a meeting last week a unanimous vote was passed condemning the action of the disloyal members, to the effect that they should each be fined the full penalty, viz., £10, and suspended from all office and voting at meetings until the termination of the strike. Over 100 voting papers were sent out to the masters employing non-unionist workmen; the returns showed that 951 men were now being employed by the sixty-seven masters who returned their papers. This shows a very satisfactory state of affairs for the masters, as only 1,500 men were employed at the beginning of the dispute.

British Workmen for the Paris Exhibition.—The Board of Trade has received through the Foreign Office copies of communications from the offices in London and Paris of the Royal Commission for the Paris Exhibition of 1900, respecting applications from British workmen for employment in connection with the Exhibition buildings. It appears that there has lately been some influx of British workmen into Paris with the object of obtaining work on the buildings, and, in view of the number of applications made at the Paris offices of the Royal Commission, it is thought desirable to point out that the French contractors are unlikely to employ foreign labour of any description, while foreign contractors charged with the erection of various foreign buildings import their workmen, as a rule, from their respective countries. Very few British contractors are connected with the construction of the exhibition buildings. British mechanics — carpenters, plasterers, painters, decorators, and others—would therefore be well advised before undertaking the risk and expense of a journey to Paris to make sure that suitable work will be obtained by them on their arrival.

Work and Wages in Germany.—Apropos of the Socialist Congress at Hanover, and by way of refuting the theory of the comrades that under the existing social system the poor are becoming poorer and the rich richer, the "Cologne Gazette" publishes an interesting column showing the improvement effected in the condition of the German workman during the past few years. Everywhere wages have risen, and the German workman's day's pay is now fairly respectable. More than two-thirds of the men employed by Krupp, who has an army of about 42,000 hands, earn on the average 4s. a day. Miners' wages have also been advanced considerably—by about 20 per cent. as compared with 1894. At the same time, the workman is insured against accident, ill-health, and old age. He is consuming 123.1 litres of beer as against 87.4 in 1878; 1.8 kilogrammes of tobacco, against 1.3; 11.8 kilogrammes of sugar, against 7.4; 6.30 kilogrammes of cotton goods, against 4.19; and 2.8 kilogrammes of coffee, against 2.3. These figures do not appear to indicate a declining prosperity. They have not, however, checked the growth of the Social Democratic party.

The Midland Counties Trades Federation held a meeting last week at Dudley, Mr. W. Millerchip presiding.—Mr. Webb referred to the dispute in the Birmingham iron-plate trade. Through the unwise action of one of the society's officials, he said, they were forced into a strike; but he was glad that the dispute was practically settled. With the exception of one they had all found employment in other factories. The strike, however, would no doubt be the means of teaching employers that they could not treat the workers as they thought fit.—Mr. J. Smith reported a dispute in the anchor trade, the men complaining that they were not receiving the proper price for a particular kind of work. He, however, wished the matter to be left in the hands of the officials of the Federation.—This was agreed to.—The chairman said the Walsall chainmakers had asked for an advance equal to 15 per cent., and a list was being discussed which would give a substantial increase.—The female chainmakers contended they were entitled to an advance. At present they were working 20 per cent. below the men, and about 400 were affected.—It was decided that the officials shall meet the workers.

Threatened Strike of Carters in Scotland.—Mr. Sampson, general secretary of the Scottish Carters' Association, has sent out a circular to all carting employers in the east and west of Scotland, calling attention to the fact that they had not yet complied with the request contained in the circulars issued on August 11th and September 27th, in which he, on behalf of the members of the association, demanded payment for stable duty at the rate of 6d. for each horse attended on Sundays, and 2s. extra on the existing rates of wages. As the patience of the members is now exhausted, it has been determined to deal with the matter in another way. The demands now are: (1) Two shillings per week advance on rates existing on September 27th. (2) Fifty hours week, and all time occupied beyond that period to be paid at the rate of 6d. per hour. (3) Stable duty on Sundays to be paid at the rate of 6d. for each horse attended on Sunday. Carters to arrange with employers how many horses one man will attend on Sunday. If these demands are not conceded on the 28th inst., a stoppage of work will take place.

A Strike in France of some magnitude has begun at the works of the Alsatian Company of Mechanical Constructions, one of the most important among the French metallurgical establishments. Nearly all of the 3,000 men employed have quitted the workshops because a workman named Linder, president of the labour union, had been discharged for threatening a comrade. Having ceased work the men, through the committee of their union, intimated that their resumption of work was conditional on the granting of the following demands: The re-engagement of Linder, the reduction of the hours of from ten and a half to ten, an increase of 25 per cent. in wages in lieu of bonuses, an increase of the wages of apprentices, the management by the workmen of the relief fund, the presentation by the company of the accounts for the past six years, the recognition of the labour union, the suppression of fines and piece-work, and a formal stipulation that no dismissal should be made for acts in connection with the strike. These demands were submitted to the company by a committee of the labour union, but thus far the only concessions admitted by the company are the return to work of Linder, and the management of the relief fund by the workmen. The men have resolved to continue the strike.

The National Association of Master Plasterers held their half-yearly conference at Birmingham last week, when an important proposal to affiliate the Scottish Association was considered. Upwards of eighty delegates attended from all parts of England, and a delegation attended from the Scottish Association, consisting of Messrs. M'Gilvray (president), Cook (secretary), Baird (Edinburgh), Stephen (Aberdeen), and Laburn (Dundee). The chair was taken by Mr. Sugden (Bradford), president of the English Association. The proposal, as sketched, was to arrive at an understanding that no member of the federated bodies would employ men engaged in a dispute with the associated masters of either country. The chairman spoke of the advantages of such a combination in dealing with disputes in any part of Great Britain. United action was more than ever necessary in the interests of the trade.—Mr. M'Gilvray expressed thorough agreement with the broad principles of the federation scheme, and promised to report favourably to the Scottish Association. Although the deputation were not in a position to pledge the associations they represented, he had no doubt of its acceptance, and he trusted a closer union would result between the associations.—Mr. Baird (Edinburgh) and the other Scotch delegates expressed concurrence. It was understood that details of the scheme would be formulated by the various secretaries and committees appointed for the purpose. It was resolved to double the membership subscription. The following resolution was adopted, and the secretary was instructed to forward a copy to the Master Builders' Association: "That this association is desirous of affiliating itself with the National Association of Master Builders, and would be glad to hear if that association would be willing to agree to such affiliation, and on what terms."

Demarcation of Joiners' Work.—A conference was recently arranged between representatives of the six principal trade unions in the joinery and cabinet making branches of the building trade to devise, if possible, means for the prevention of the constant disputes in regard to the apportionment of the details of employment between these branches.—The Conference, after discussion, adopted the two following resolutions: (1) "That this joint Conference of the representatives of the Cabinet Makers' and Carpenters' and Joiners' Trade Societies, after a prolonged discussion on the question of the constantly recurring friction between the members of the respective societies on the various classes of work upon which they may be engaged, consider that the attempt to define what work should be done by the members of the respective societies is impossible. But, in order to put an end to these deplorable disputes, the only solution of the difficulty, in our opinion, is that in all cases where joinery or cabinet and house furnishing firms tender for and obtain such work as ship, bar, bank, office, hotel, and the interior fittings of houses, that the members of the respective societies working for such firms should on no account accept other than the highest rate of wages, and conform to the conditions and privileges that may be established by the unions engaged in the wood-working trades in that particular district." (2) "In the event of any dispute arising between the members of the Carpenters' and Joiners' and Cabinet Makers' Trade Societies who may be working together, if not settled locally, the matter in dispute shall be laid before the respective Executive Committees, the men to remain at work until investigation is made into the cause of the dispute. Further, the Executive Committees of the above societies pledge themselves to deal with such cases within seven days from the time notice of such has been brought to their attention. Investigations into the causes of complaint to be made on the spot if necessary." It was decided by the Conference that a vote should be taken of the members of the six trade unions represented in the Conference on the question whether the two resolutions, as drawn, should be finally accepted. The votes were as follow: Amalgamated Society of Carpenters and Joiners, for the first resolution, 5,352, against 7,648; for the second resolution, 6,103, against 6,471. General Union of Carpenters and Joiners, for the first resolution, 1,319, against 706; for the second resolution, 1,377, against 605. Alliance Cabinet Makers' Association, for the first resolution, 1,566, against 77; for the second resolution, 1,605, against 39. Amalgamated Union of Cabinet Makers, for the first resolution, 691, against 106; for the second resolution, 743, against 61. Scottish Cabinet Makers' Union, for the first resolution, 446, against 1; for the second resolution, 434, against 11. The scheme cannot therefore be put into operation, but it is hoped that further discussion may lead to the adoption of some similar method by means of which disputes may in the future be avoided.

Builders' Notes.

Where the Jerry Builder is Unopposed.—At Hong Kong, says a writer in "Indian Engineering," houses are collapsing from sheer inability to stand up unpropped! It is said that houses are now being built of the worst possible refuse ever designated as bricks; the walls are constructed without mortar, merely dried blue bricks piled upon each other; and these walls are propped up with bamboo poles until the joists and roofs are put on to give them some semblance of "binding." This is a strong indictment and there is unfortunately much truth in it.

London County Council.—At the weekly meeting of the Council held on October 17th the recommendation of the Highways Committee was adopted that Mr. A. B. W. Kennedy should be appointed engineer-in-charge of the construction and re-construction works of the tramways and light railways for electric traction. Sanction was given to make application to construct four light railways in the suburbs:—(1) Holloway; (2) Clapham to Kingston; (3) Deptford to Shooters Hill and Woolwich; and (4) New Cross to Eltham. The total estimated cost of construction is £635,100, and that of the acquisition of property for the necessary street widenings, £130,900. It was decided to provide a home for inebriates at Charlwood at a cost of £14,250.

Public Works Without Contractors.—Major-General H. D. Crozier, R.E., recently held an inquiry at East Ham into an application for sanction to borrow £41,499 for electric lighting and for consent to the appropriation of certain land as a site for the works, and to borrow £3,600 for purposes of street improvement. The inspector, being informed that the Council had decided to do the work without contractors as far as possible, said that in that case they would have to employ separate workmen for it. They could not employ any man on their permanent staff under the Public Health Act to do this work on borrowed money. The surveyor said he had done it for years, and wanted to know whether the inspector considered it illegal. The Inspector: You are not to employ men in the permanent employ of the Council to do this extra work on borrowed money. That is the law.

Lead Poisoning Prosecutions.—A case of considerable importance to lead manufacturers was heard at Derby on October 18th.—Messrs. Cox Brothers, lead manufacturers, were summoned for not reporting two cases of lead poisoning, and also for storing red lead in a room where it was being manufactured.—Mr. C. H. Taylor, an appointed surgeon under the White Lead Rules, was summoned for failing to report a case of blood poisoning which took place. Though a number of cases of poisoning had taken place at the works, neither the employers nor the doctor, whose duty it was to make periodical visits, reported the occurrences to either the inspector or the Home Office. — The defendants admitted technical offences. Messrs. Cox Brothers were fined 10s. and costs in one case and 20s. and costs in the other.—The doctor was fined 1s. and costs.

A Dispute about a Patent for Preventing Slipping.—William Stevenson Dougall, an engineer of Radcliffe-on-Trent, recently sued Messrs. Watkin Bros., Limited, timber merchants, of Northampton and Leighton Buzzard, at the Bingham County Court for £10 in connection with a patent of his for covering pulleys. The case was heard on October 17th. The plaintiff said that he called on the defendants and they gave him an order to cover two pulleys at the agreed price of £10. He never guaranteed anything with regard to single "drivers," and said his patent would stop slipping if applied to all the pulleys about the machinery, but not otherwise.—The managing director of the defending firm stated that plaintiff had guaranteed to stop the slipping. This his patent did for two or three days, but ultimately proved useless. — His Honour, in causing judgment to be entered for the plaintiff, with costs, said the burden of proving that there was a guarantee was upon the defendants, and they had failed to satisfy him that there was one. He should have thought a limited company would have taken a guarantee in writing.

Surveying and Sanitary Notes.

The New Science and Art Schools at Newark, are being warmed and ventilated by means of Shorland's patent Manchester Grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Street Improvements at Derby. — A Local Government Board inquiry was recently held into the application of the Derby Town Council to borrow £9,598 chiefly for improvements in Larges Street, Pear Tree Road, and other thoroughfares.

Gnoll Road Congregational Church, Neath, has been warmed and ventilated by Messrs. John King, Ltd., engineers, Liverpool, who have installed their latest improved "Small Tube" hot-water heating apparatus, special economical coil-heater, and patent tubular exhaust ventilators.

Ventilation.—In Mr. G. S. Nicols' new workshop and show rooms, Bath Street, Glasgow (built from designs by Mr. L. B. Buick, Glasgow), Cousland's Improved Climax Patent "Natural Exhaust" Ventilators have been fitted by The Climax Ventilating and Heating Co., Ltd., of Glasgow.

At the New Sewage Works at Hampton, which was briefly referred to on page lxxxiii. of the supplement to last week's issue, the sewage is rendered innocuous by means of microbes. It is forced to the station by means of what are called Shone's injectors, and flows over beds formed of clinker and earth. Here it is left standing, so as to allow minute organisms, which cover every particle of the clinker, to attack the organic matter contained in the sewage, and after passing over two similiar beds (the clinker of which is of a finer character) the effluent flows out pure and sparkling. One of the most remarkable features of the system—which, by the way, owes its origin to Dr. Dibdin, formerly chemist to the London County Council—is that no chemicals whatever are employed in the process, and no sludge remains after the sewage is purified. The work of constructing the beds and laying the mrains was carried out by the Council by means of direct labour, and entailed an expenditure of £61,000. The system has been in operation now for ten months, and the chairman of the Thames Conservancy says it is a complete success.

For Street Improvements at Newcastle, estimated to cost £2,011, a Local Government Board inquiry was held on October 17th.

For Private Street Improvements at West Bridgford, estimated to cost £1,500, a Local Government Board inquiry was held on October 20th.

The Royal Commission on Sewege Disposal inspected the Birmingham Tame and Rea Drainage Board's farm on October 19th. Among those present were Sir R. Thorne, Sir Michael Foster, Professor Ramsay, Dr. J. B. Russell, Colonel Harding (Lord Mayor of Leeds), T. W. Killick, C. P. Cotton, F. J. Willis (secretary to the Commission), the Lord Mayor of Birmingham and several prominent local officials.

Improvements at Birmingham.—Colonel Marsh held a Local Government Board inquiry on October 17th at Birmingham into the application of the City Council for sanction to borrow £4,715 for works of sewage and surface-water drainage, £3,100 for the extension of the Corporation wharves at Harborne and Shadwell Street, £3,650 for improving the River Rea, and £3,000 for the improvement of the Hockley Brook. No opposition was made.

Laying out the Barry Parks.—The Barry District Council recently offered prizes of £100, £50, and £25 for plans for laying out the new Romilly Park and the Victoria Park. The competition was restricted to three landscapes gardeners, with the result that the first prize was awarded to Mr. Ralph Crossling, Penarth; the second prize to Mr. W. L. Skinner, Wakefield; and the third to Mr. A. Pettigrew, Cardiff. To the designs prepared by Mr. Crossling, the cost is £6,865 for Romilly Park and £3,590 for Victoria Park.

Engineering Notes.

Chester Tramways.—The Chester Town Council has decided to take over the undertaking of the Chester Tramways Company, Ltd.

Edinburgh and Leith New Gasworks.—The foundation stone of the new works at Granton of the Edinburgh and Leith Gas Commissioners was laid on October 16th.

The West of Scotland Iron and Steel Institute held the opening meeting of the present session on October 20th at Glasgow. Mr. James Riley, the chairman, introduced the newly-elected president, Mr. George Beard, of the Gartcosh Ironworks.

For Stealing Gas at Mansfield Matthias Baker was recently fined £2. It appears that he had made a connection with the gas pipe near the meter, and by means of an indiarubber tube took the gas to his rooms, without it passing through the meter.

An Electric Railway from London to Brighton is a scheme for which, it is stated, a Bill is to be deposited during the coming Parliamentary session. The railway will be an extension of the City and South London Railway, and it is reported that fares will be cheap and speeds high.

An Experiment in Lighting Country Railway Stations.—Up to the present the lighting of country stations by means of gas has been regarded as almost an impossibility, in consequence of the great expenditure and large plant required to work it successfully. The Great Central Railway Company are, however, making an experiment at Brocklesby Station, about ten miles from Grimsby. This company is the first railway company in Great Britain to adopt the system of lighting their country stations with Aerogene gas, although it has been in use for some time in Switzerland. If the experiment proves successful the gas will, no doubt, be introduced on all the company's country stations.

Glasgow Corporation Tramways.—The Glasgow Corporation Tramways Committee opened tenders on October 18th for the underground cables required for the extension of the trolley system, and resolved to recommend that the offer of the National Conduit and Cable Company, London, be accepted. The amount of the contract is £150,000.

An Electric Explosion took place at one of the most crowded points in Market Street, the principal thoroughfare of Manchester, on October 18th. The explosion occurred in a manhole under the pavement, and the force was sufficient to uplift three large flagstones, one of which, together with the covering of the manhole, was blown to pieces.

Hampshire Light Railways.—On October 19th the Light Railways Commissioners sitting at Whitchurch, Hampshire, sanctioned a scheme for the construction of a light railway in the Bourne Valley, connecting with the South-Western Railway system at Hurstbourne and with the Great Western by a junction with the Didcot, Newbury and Southampton line. The Earl of Portsmouth, who is the largest landowner in the district, opposed the scheme.

Sea Defence Work at Southwold.—The important sea defence work now being constructed in front of Southwold is proceeding very quickly. Rows of stout timbers are already in position, on top of which will be the Cliff Promenade, leading from Centre Cliff to Gun Hill, which path, since the memorable gale of 1897, has been destroyed. The tramway for taking material from the Salt Works' Creek is laid, and the work will shortly be ready for filling in.

The Institution of Civil Engineers.—The Council of the Institution of Civil Engineers have, in addition to the medals and prizes given for communications discussed at the meetings of the Institution during the last session, made the following awards in respect of other papers dealt with in 1898-99:—Telford medals and premium to L. Franzius (Bremen) and G. H. Thierry (Bremen) a George Stephenson medal and a Telford premium to G. Watson (Leeds); and Telford premiums to D. F. Vernon-Harcourt (London), F. Osmond (Paris), Max am Ende (London), T. E. Stanton (Liverpool), W. Hibbins (Bristol), James Strachan, C.I.E. (London), T. Donaldson (London), and T. W. Barber (London). For students' papers the awards were:—The James Forrest medal and a Miller prize to H. Lapworth (Birmingham); Miller prizes to F. C. Grimley (Colchester), W. Middleton (Chelmsford), F. T. Wolseley-Lewis (Manchester), A. H. Tyack (Manchester), R. A. E. Murray (Glasgow), C. R. Rutherglen (Glasgow), and W. D. S. Brown (Newcastle).

A New Method of Cooling Air.—According to the "Chicago Record" a machine has been built on novel principles for cooling the air of houses and apartments. It differs from the refrigerating machines now in use, which convert mechanical energy into heat, abstracted through the medium of liquefied gases, in that it depends on utilising the great latent heat of the evaporization of water. It is not intended for heavy refrigerative work, but for cooling at maximum efficiency over the range of 10deg. to 25deg. F., required to keep a room at comfortable temperature on a hot summer day. To furnish the forced blast which provides both the air circulation and the chilling effect, all that is required is a little electric blower. This evaporates the water, which is distributed in a capillary film so effectively that 10,000 cubic feet of air can be cooled to about 68deg. F. There is an automatic adjustment which keeps the temperature at any desired degree of humidity. The water can be taken from any local supply and current from the nearest available source. The apparatus requires no more attention than a common fan motor, and can be set up in sick rooms or hospitals, where such an appliance is often invaluable.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDINGS—		
Oct. 27	Alnmouth—Marine Residence		M. T. Wilson, Architect, Alnwick.
,, 27	Keith, Scotland—Addition to House	W. Gordon	F. D. Robertson, 92, Midd-street, Keith.
,, 27	Letterkenny—Alterations, &c., to Creeve House	D. Leitch	J. McIntyre, Architect, Letterkenny.
,, 27	Penygroes, Wales—Alterations, &c., to Chapel		Rev. W. E. Williams, Bryn Myfyr, Penrygroes, R.S.O.
,, 27	Weston-super-Mare—Photographic Studio		H. F. Price, Architect, Weston-super-Mare.
,, 27	London, S.W.—Retaining Walls and Foundations to New War Office	H.M. Commissioners of Works and Public Buildings	Sir J. Taylor, H.M. Office of Works, Storey's-gate, S.W.
,, 28	Warblington—Public Offices, &c.	Urban District Council	F. Swinburne, West-street, Emsworth.
,, 28	Kennethmont, Scotland—Workmens' Houses	Ardmore Distillery	C. C. Doig, Architect, Elgin.
,, 28	Canterbury—Six Cottages	Town Council	City Surveyor, Tudor-chambers, Canterbury.
,, 28	Harrow, near London—Manufacturing Premises		O. P. Parsons, 14, Temple-street, Birmingham.
,, 30	Halifax—Iron and Brass Foundries		Jackson and Fox, Architects, Rawson-street, Halifax.
,, 31	Barry, Glamorgan—Alterations, &c., to School	County Council	T. M. Franklen, County Offices, Westgate-street, Cardiff.
,, 31	Fletton—Schools	School Board	W. Boyer, 10A, Cowgate, Peterborough.
,, 31	Sandown, Isle of Wight—Higher Grade School	Brading School Board	J. Newman, Architect, Thornton, Sandown.
Nov. 1	Myton-on-Swale, Yorks.—School		W. Ward, Myton Hall, Helperby.
,, 1	Bargoed, Wales—Retaining Walls and Drainage		D. J. Longher, Architect, Bank-chambers, Pontypool.
,, 1	Gayton, Kings' Lynn—Alterations to Workhouse	Freebridge Lynn Union Guardians	H. T. Tilson, Architect, Railway-road, King's Lynn.
,, 1	Mallow—Repairs to Cottages, Sinking Wells, &c.	Rural District Council	M. Regan, Clerk, Mallow.
,, 2	Brecon—Intermediate Schools		J. H. Phillips, Architect, St. John's-chambers, Cardiff.
,, 2	London, N.—Chimney Shaft, &c.	St. Mary's Guardians, Islington	W. Smith, 65, Chancery-lane, W.C.
,, 2	Halifax—Chapel and Sunday School		M. Hall, 29, Northgate, Halifax.
,, 2	Alresford—Additions, &c., to Workhouse	Union Guardians	Board Room, Union Workhouse, Alresford.
,, 2	Deal—Underground Lavatory	Corporation	T. C. Golder, 23, Queen-street, Deal.
,, 3	Padstow, Cornwall—Coastguard Buildings	Admiralty	Director of Works Dept., 21, Northumberland-avenue, W.C.
,, 3	Banff, N.B.—Coastguard Buildings	Admiralty	Director of Works Dept., 21, Northumberland-avenue, W.C.
,, 4	Sheffield—Fireclay Goods (Retort Bricks, &c.)	United Gaslight Company	J. W. Morrison, Co.'s Engineer, Commercial-st., Sheffield.
,, 4	Rushall, near Walsall—Alterations, &c., to School	School Board	Hickton and Farmer, Architects, Bridge-street, Walsall.
,, 6	Bermondsey, S.E.—Painting and Decorating Town Hall	Vestry	Surveyor, Town Hall, Bermondsey, S.E.
,, 7	Douglas, Isle of Man—Enlarging Post Office	Commissioners of H.M. Works	J. Flew, 11, Popplewell-chambers, Market-street, Bradford.
,, 7	Walthamstow—School Buildings	School Board	W. A. Longmore, Bridge-chambers, Hoe-st., Walthamstow.
,, 7	Enfield—Girls' Department and Assembly Hall	School Board	G. E. T. Laurence, 181, Queen Victoria street, E.C.
,, 7	London, W.—Female Staff Home, &c., &c., at Infirmary	St. George's Union Guardians	E. T. Hall, 57, Moorgate-street, E.C.
,, 8	Victoria, Mon.—Forty Houses	J. Light	Shalwell and Creighton, Architects, Steam Packet-chmbrs., Dock-street, Newport, Mon.
,, 8	Hastings—Laying Fireproof Floor	Union Guardians	Jeffery and Hillier, 5, Havelock-road, Hastings.
,, 13	Leicester—Wholesale Market	Corporation	W. Brand, 16, Bishop-street, Leicester.
,, 13	Westbury-on-Severn—Tramp Wards, &c.	Union Guardians	W. F. Jones, 21, George-street, Gloucester.
,, 14	Woolwich—Public Library	Local Board of Health	Church, Quick & Whinsop, Architects, William st., Woolwich.
,, 15	Rhyl, Wales—School Buildings	Governors of Intermediate Schools	F. H. Shaylor, Architect, Belvoir House, Shrewsbury.
,, 20	Southampton—Workhouse Infirmary	Guardians	W. H. Mitchell, Son and Gutteridge, 9, Portland-street Southampton.
,, 22	Cricklade, Wilts.—Police Station	Standing Joint Committee	C. S. Adye, County Surveyor, County Offices, Trowbridge.
	ENGINEERING—		
Oct. 27	Cwm Brombil, Port Talbot, Wales—Laying Water Main		J. Taylor, Sons and S. Crimp, 27, Great George-st., S.W.
,, 27	Wivenhoe, Essex—Sinking Borehole	Urban District Council	Sands and Walker, Engineers, Angel-row, Nottingham.
,, 27	Darwen, Lancs.—Tramway	Corporation	Borough Engineer, Town Hall, Darwen.
,, 30	Birkenhead—Cooking Apparatus	Workhouse Guardians	E. Kirby, 5, Cook-street, Liverpool.
,, 30	Stonehaven—Harbour Extension	Harbour Trustees	J. Barron, 1, Bon Accord-street, Aberdeen.
,, 31	Chipping Campden—Waterworks	Rural District Council	N. Lailey, 16, Great George-street, Westminster.
,, 31	Aylesbury—Machinery at Sewage Disposal Works	Urban District Council	J. H. Bradford, 2, Rickford's-hill, Aylesbury.
Nov. 2	London, N.—Boiler and Building Flues, &c.	St. Mary's Guardians, Islington	W. Smith, 65, Chancery-lane, W.C.
,, 3	Sydney, New South Wales, Australia—Refuse Destructors	Municipal Council	J. R. Palmer, Town Clerk, Sydney.
,, 4	Bahia, Brazil—Lighting Town		British Consulate, 6, Great Winchester-street, E.C.
,, 4	Faversham—Sinking Well	Water Company, Ltd.	B. Latham, 13, Victoria-street, Westminster.
,, 8	Wrexham—Electrical Plant	Town Council	W. H. Trentham, 39, Victoria-street, Westminster, S.W.
,, 11	Latheronwheel, Caithness—Breakwater	County Council	J. Brims, County Clerk, Thurso.
,, 11	Warrington—Covered Concrete Service Reservoir	Corporation	J. Deas, Engineer, Bank House, Warrington.
,, 14	Birkenhead—Electric Motor-cars for Tramways	Corporation	C. Brownridge, Borough Engineer, Town Hall, Birkenhead.
,, 14	Glasgow—Engines	Corporation	J. Young, 88, Renfield-street, Glasgow.
,, 15	Blackburn—Destructor		W. Stubbs, Borough Engineer, Blackburn.
,, 15	Hoylake, Cheshire—Electric Lighting	Urban District Council	T. L. Miller, 7, Tower-buildings N., Water-st., Liverpool.
,, 30	Port Elizabeth—Railway		General Manager of Railways, Capetown.
Dec. 30	Panama—Aqueduct	Authorities	Commercial Department, Foreign Office, Whitehall, S.W.
,, 31	Porto Alegre—Electric	Municipality	Commercial Department, Foreign Office, Whitehall, S.W.

Property and Land Sales.

In the City of London.

Most important BUILDING SITE, situate on the east side of Finsbury-pavement, nearly opposite Moorgate-street Station and the Station now being erected on the City and South London Electric Railway. The site is covered with the houses numbered 42, 44, 46, 48, 50, and 52, Finsbury-pavement, and 1A and 2, South-place.

The site has a frontage of 166ft. to Finsbury-pavement, another frontage to South-place of 109ft., and it is bounded in the rear or east side by a paved yard, to which it has frontage and cart access. The superficial area is 16,750ft., and the entire site can be utilised, as it is exceptionally free from rights of light appertaining to adjacent properties, and it is admirably suited either for shops with offices over, or for banks, insurance offices, or public companies.

The above will be LET by AUCTION by

DANIEL WATNEY and SONS, by direction of the Fishmongers' Company, Governors of Holt School, and with the approval of the Charity Commissioners, at the Mart, Tokenhouse-yard, E.C., on THURSDAY, NOVEMBER 2nd, 1899, at TWO o'clock precisely.

Particulars, with plan and conditions of letting, may be had either of Mr. J. WRENCH TOWSE, Fishmongers' Hall, London Bridge; Mr. C. O. HUMPHREYS, Giltspur-chambers, Holborn-viaduct; Mr. HOWARD CHATFEILD CLARKE, the Company's Surveyor, 63, Bishopsgate-street-within; and of the Auctioneers, Messrs. DANIEL WATNEY and SONS, 33, Poultry, E.C. 1

SALE DAYS for the Year 1899.
Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Oct. 26
Thursday, Nov. 16
Thursday, Nov. 23
Thursday, Dec. 7
Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By EDWIN FOX and BOUSFIELD.

At the Auction Mart,

On WEDNESDAY, NOVEMBER 8th, at TWO o'clock, in Two Lots.

(By Order of the Trustee of the Rev. L. A. Sharpe, deceased.)

ST. GEORGE'S-IN-THE-EAST.—A Capital, Compact, FREEHOLD ESTATE, for investment or development, well situate just off the Commercial-road, and close to the London Docks, covering one acre, or thereabouts, with extensive frontages to James, Samuel, William, and Langdale streets, and is available for the erection of blocks of warehouses or dwellings. The site is at present occupied by sixty-four houses, workshops, and beerhouse, let on leases expiring Christmas, 1899, and Lady-day, 1901, at ground-rents amounting to £147 5s. per annum, with reversion at the expiration thereof, in less than two years, to the rack-rents estimated at about £1,600 per annum.

Particulars at the Mart; of Messrs. MORRELL and SON, Solicitors, Oxford; and Messrs. PAINES, BLYTH, and HUXTABLE, Solicitors, No. 14, St. Helen's-place, E.C.; and at Messrs. EDWIN FOX and BOUSFIELD'S Office, 99, Gresham-street, Bank, E.C.

Very Valuable Building Site, having the large area of 2,285ft. super, now occupied by No. 64, Leadenhall-street, in the CITY of LONDON, on the south side of the thoroughfare, and a few doors only from the important junction of Leadenhall with Fenchurch-street and Aldgate; highly suitable for the erection of block of offices, for which there is a demand in the locality, situate as the property is near to the shipping markets and the new centre now being formed by Lloyd's-avenue.

MESSRS. JONES, LANG, and CO. have been instructed to LET by AUCTION the above very valuable BUILDING SITE on FRIDAY, NOVEMBER 3rd, 1899, at TWO o'clock, at the AUCTION MART, Tokenhouse-yard, E.C.

Particulars, with condition of letting and plans, can be had of HENRY I. COBURN, Esq., Solicitor, 54, Leadenhall-street, E.C.; or of the AUCTIONEERS, 3, King-street, Cheapside, E.C., or at their Branch Office, 95, Leadenhall-street, E.C. Telegraphic Address, "Wonderment," London.

FREEHOLD CORNER BUILDING SITE, BERMONDSEY.

MESSRS. FIELD and SONS will SELL by AUCTION, at the MART, Tokenhouse-yard, E.C., on TUESDAY, OCTOBER 31st, 1899, at One for Two o'clock, a FREEHOLD BUILDING SITE, at the corner of Grange-walk and Fendall-street, together with the DWELLING-HOUSES thereon, now let to weekly tenants, and being Nos. 62, 63, 64, 65, and 66, Grange-walk, containing a superficial area of 7,350ft. with a frontage of 80ft. to Grange-walk, and of 108ft. 6in. to Fendall-street. The property offers a very fine site for warehouses or factories, as it is within a few minutes' walk of the Tower Bridge, the opening of which has caused an increased demand for such in this district, now brought within a very short distance of the centre of the City of London.

Particulars of Messrs. WYNNE-BAXTER and KEEBLE, Solicitors, 9, Laurence Pountney-hill, E.C.; at the Mart; and of the AUCTIONEERS, 54, Borough High-street, S.E., and 52, Chancery-lane, W.C.

Contractor to War Office, Admiralty, and Board of Works, writes:

"Our City Engineer having shown me a copy of 'Specification,' I would be glad to have one for my office, and herewith enclose Postal Order."

Cork, 10th October, 1899.

PRESS OPINIONS.

"The Surveyor" says of No. 4:

"We have already had occasion to bring to the notice of our readers the advantages of the remarkable and unique work of reference issued under the title of SPECIFICATION, from Effingham House, Arundel Street, London, by the proprietors of 'The Builders' Journal' and 'The Architectural Review.' When we say that a work of reference is exhaustive, accurate, and arranged on admirable lines, we have said all that really requires to be said, and detailed notice is therefore scarcely called for as each new issue appears, except, of course, as regards the introduction of new features. In that respect a good deal can be said in praise of the new issue. . . . . There is another matter to which we may fitly draw attention in these columns, inasmuch as it is one which will be peculiarly acceptable to many of our readers. We refer to the fact that a special division has been arranged for under the heading of 'Municipal Engineer.' . . . . It is really impossible to give an adequate idea of the book by means of a notice. It is a professional library in one volume, and its scope and value can only be properly appreciated by an actual examination. We are safe in saying that to see it is to feel a strong desire to possess it. There is a strong list of contributors, and the numerous illustrations form one of the strongest features of an excellent compilation, the production of which must have involved no small labour. There are over 700 pages, and the price is only 5s. nett."

Special Offer.

TO THOSE who have not yet purchased this colossal work we make this offer. Anyone purchasing from this office a copy of "SPECIFICATION" No. 4 who is dissatisfied with it can return same within 3 days from date of purchase, and the money will be refunded, provided that the copy is in the same condition as when purchased.

* * *

The Publisher will send copies of "Specification" No. 4 to any address in the United Kingdom for 5/6, carriage paid.

THE FINEST COMPILATION OF BUILDERS' PRICES.

REDUCED *FAC-SIMILE* PAGE OF SPECIFICATION CLAUSES.

Continuation of **Specification.** *Concretor.*

WORKMANSHIP.

GENERALLY.

24. **Proportions.** Proper boxes or measures must be provided for accurately measuring the proportions of the various materials for the concrete. Such proportions to be ascertained by actual measurement at each mixing.

25. **Mixing.** The materials for the concrete are to be mixed by first filling a cubic yard or other suitable measure with the aggregate, then adding the cement (which must be separately measured). The whole to be twice turned over dry, then shovelled into a third heap, at the same time adding from the rose of a watering-pot sufficient water only to make the ingredients cling together. The materials to be again turned over in a wet condition before being removed and deposited in position. All necessary precautions must be taken to prevent the cement being blown away during the mixing.

26. **Porous materials to be wetted.** The whole of the coke breeze, broken brick, stone, or other porous aggregate to be well wetted with water before mixing, turned over, and allowed to drain, so that the surfaces may be damp, but not wet, when required for use.

27. **Concrete to be freshly made.** The concrete is to be mixed in convenient quantities to suit the requirements of the work. The chopping up and use of concrete or cement which has begun to set will not be permitted.

28. **Levelling.** All concrete when deposited in position is to be carefully levelled or laid to falls as may be required, and brought to an even and finished state.

29. **Setting.** Every care must be taken not to disturb the concrete whilst setting. In all cases where it is found absolutely necessary to pass over newly formed concrete, planks are to be carefully laid down.

30. **Work prohibited during frosty weather.** No concrete work shall be executed during frosty weather, nor even if there shall be any probability of a frost occurring before the concrete has had sufficient time to set.

FOUNDATIONS.

31. **Concrete in Trenches.** The concrete to be lowered into the trenches and not thrown in. After the concrete has been deposited in position it is to be well worked against the sides of the trenches by means of a spade or trowel, lightly rammed with wooden beaters, properly levelled, and brought to an even surface.

32. **Building on Concrete.** An interval of seven days (or such other period as may be directed) is to elapse between the completion of the concrete foundations and the commencement of any building upon them.

UNDER BOARDED FLOORS.

33. **Laying.** The concrete to be 6in. in thickness, lightly rammed with wooden beaters until the moisture rises to the surface, floated to a smooth and even face and finished to proper falls or levels.

UNDER TILE OR OTHER PAVEMENTS.

See Clause 33.

PAVING.

34. **Laying.** The concrete paving to be 6in. in thickness, finished with a granite surface, and smoothly floated to proper falls or levels.

35. **Granite Surface.** The surface of the concrete paving to be formed with a layer of granite concrete 1in. in thickness, lightly rammed with wooden beaters and floated to a perfectly smooth and even face. The entire thickness of the paving to be laid and finished in one operation.

36. **Expansion Boards.** Provide and fix expansion boards or slips at intervals of every 12ft., including removing same at completion, filling up the cavity with concrete and making good the surface.

37. **Watering Surfaces.** The finished surface of the concrete to be kept damp for at least seven days (or fourteen days) after being laid, by covering with wet sand or sawdust. The sand or sawdust to be kept moist during the period named by frequently sprinkling it with water from the rose of a watering-pot.

38. **Protection.** The concrete surfaces to be properly protected from any injury that might be caused by passing traffic, falling materials, etc.

39. **Freedom from Discolouration.** The surface of the concrete paving to be of uniform colour throughout, and free from any stain, discolouration, or other defect.

40. **Surface Channels.** Surface channels, having a shallow curved section, to be formed in the concrete paving where shown on the drawings. To be laid to proper falls, and neatly dished round the top of each gully.

UPPER FLOORS.

41. **Laying.** The concrete to be hoisted to the required height, and carefully filled in between the rolled steel (or iron) joists to a depth of 9in. (or other specified thickness), lightly rammed with wooden beaters, and levelled and floated to an even surface. Each concrete floor is to be laid and completed at one operation, the necessary arrangements being previously made for carrying on the work without cessation.

42. **Watering Surfaces.** *See* Clause 37.

43. **Sheeting.** Provide and fix proper deal rough (or wrought) flat sheeting, with flush joints, including all necessary supports and strutting that may be required, and remove at completion.

43a. **Alternative Clause.** Provide and fix proper deal rough (or wrought) sheeting on proper centres or turning pieces, and of the curvature shown on the drawings. To include all necessary supports and strutting that may be required, and remove at completion.

44. **Removal of Sheeting.** The sheeting, &c., is not to be disturbed for a period of at least fourteen days after the concrete has been laid (or such other period as may be considered necessary), and it shall not be removed without first obtaining the sanction of the architect (or engineer) in writing.

45. **Sheeting to be Wetted.** The upper surface of the sheeting to be well wetted from the rose of a watering-pot before depositing the concrete upon it.

WALLS, PARTITIONS, STANCHIONS, Etc.

40. **Depositing.** The concrete to be carefully deposited in position, and lightly rammed between the casing and around the iron or other cores as shown on the detail drawings.

47. **Girders and Stanchions.** All projecting girders and stanchions to be similarly encased with concrete where required.

48. **Casings.** Provide and fix proper deal casings with flush points, including all necessary timbering and strutting, and remove at completion.

48a. **Moulds.** Provide and fix proper moulds to all bull-nosed angles, reveals for door frames, chases, and recesses where shown on detail drawings, and remove at completion.

49. **Removal of casings.** The casings and moulds shall not be removed until the concrete has thoroughly set.

LINTELS.

50. **Moulded Work.** The concrete for lintels to be filled into properly constructed moulds or boxes and well worked around the iron or other cores as shown on the detail drawings. The lintels to be made 18in. longer than the opening over which they are to be fixed, so that they may rest 9in. on the wall at each end. To be 9in. in depth for all spans not exceeding 4ft., and 12in. in depth for all spans exceeding 4ft. and not exceeding 6ft.

51. **Cores to be Embedded.** All lintels having a bed or width not exceeding 9in. to have a core consisting of a 3in. × 3in. rolled steel (or iron) joist weighing 10lb. per foot run properly embedded in the same. An additional joist to be added for every additional 9in. in width or bed of lintel.

52. **Seasoning.** The concrete lintels to be left in the moulds until properly set, and to be made at least six weeks before being required for building into position.

53. **Moulds.** Provide all necessary moulds, casings, and patterns that may be required for the proper construction of the concrete lintels as shown on the detail drawings.

BRICKS.

54. **Fixing Blocks.** Breeze bricks to be built into the walls where shown on drawings or otherwise directed for the proper fixing of joinery, etc. The concrete to be filled into suitable moulds and allowed sufficient time to set and harden before being used.

SEA AND RETAINING WALLS.

55. **Concrete to be carried up uniformly.** The concrete to be carried up uniformly over the whole area embraced in each section under construction, no part to be more than 3ft. higher than another. To be laid in horizontal courses not exceeding 18in. deep.

REASONS

Why you should purchase the 4th Number of Specification.

1.—It is the only book that covers the wide field of Modern Constructional Work.

2.—It contains 3,000 Specification Clauses, Builders' Prices, Building Act Regulations, a Directory, Articles on Planning and Designing, over 20,000 Experience Notes, with an Index to the whole.

3.—It is always ready for reference. If you wish to decide the best way to design a piece of work, the notes in Forty-four Sections are ready to assist you. In writing your Specification, Model Clauses are provided to save you time and thought. In the Building Act Clauses you will find all the regulations affecting your design, and with the help of the Prices you can easily get out your estimate.

4.—It is not the work of one man. Over 120 Skilled and Expert Contributors have assisted in its Compilation, contributing to those Trade Sections in which their expert knowledge is admitted. Accuracy and authoritativeness are thus gained, and the risk of errors of judgment or prejudice, which might be possible in one man's work, are avoided.

5.—In addition to its comprehensiveness, authority, and accuracy, it has the additional advantage of being the most inexpensive work of reference offered to the public. At the published price of **5/-** it is "A Marvel of Cheapness."

6.—It will save you hundreds of hours in your professional or business capacity.

Why you should not purchase the 4th Number of Specification.

An Architectural Causerie.

The Passing of the Suburban Inn.

The builder is so active in the suburbs of London, and the brewers and licensed victuallers so greedy of huge profits, that the last days of the semi-rural picturesque roadside inn are come. There has always been such an outcry against the destruction of these old-world places for the sake of building towering modern gin-palaces that the ordinary man might well think the best business policy to be that which preserved the buildings that made such pictures, and were surrounded with so much affection and romance. But this is one of those things "which no fellow can understand," as Lord Dundreary remarks in the play. We all acknowledge that the picturesque inn is worth preserving and that it should be retained, yet we pull all the best examples down, and vulgarise the sites of them, painting the moral and picturing the shame of it by decorating the halls of the gin-palaces that take their place with painted tile-pictures of what has disappeared to make room for all this plate-glass and glitter. There would in many instances really seem to be no reason why this destruction should take place. When the old "Cock" at Sutton was pulled down a year ago, there disappeared as fine and substantial a house as one could wish to see, and one connected with the old coaching days and the Prince Regent, who halted here in his carriage on the way to and from "Brighthelmstone," as Brighton was then called. Was there any valid reason for demolishing the place? The answer must be in the negative, for in this instance the new building of the "Cock" occupies a somewhat different site, and the old site is still a desolate heap of bricks.

The latest suburban inn to disappear is the "Bell," at Hounslow. Just where the highway divides in two, at the west end of that town, the old "Bell" stood, quaintly edged in by polled elms, and with a gallows-like sign hanging over the footpath bearing a great blue and gilded bell. Local legends say that the Knights of the Road who haunted Hounslow Heath in the old coaching days were in league with local inn-keepers, and particularly with mine host of the "Bell," who had a kind of "information bureau" on their behalf of likely travellers passing the turnpike gate that formerly stood just here. Hounslow Heath disappeared many years ago, converted from a flat, dreary, and dangerous waste to a wide stretch of market gardens. When railways came in, and the great highway to the West of England that ran through Hounslow became deserted, that town, which had been one of the busiest coaching centres in the kingdom was utterly ruined, and the many old coaching inns were either pulled down or converted into shops or private houses. The "Bell" was practically the last relic of those old days, and now it has gone Hounslow is nothing but an ordinary, and a very unpleasing, London suburb. Many another old-fashioned inn demolished within the last two or three years might be named, the "Brockley Jack," and the "Red Cow," at Hammersmith, among them: but the task of enumerating what we have lost would be both painful and unprofitable. Only let us put them on record as they go, to show to future generations how superficial our sentiment and how ingrained our commercialism at the close of the nineteenth century.

THE BELL
SICH'S ENTIRE & THE CHISWICK ALES
CGHARPER

THE BELL, HOUNSLOW. DRAWN BY C. G. HARPER.

The Cathedral of Pan.

Long, green, endless aisles, all moist and glistening with the dank air, running eastward and westward! The eastern end is so far that it is lost in a multitude of shadows, thrown by the innumerable columnal beeches and sturdy oaks on either side. There is no sound in all the woods around, scarcely a movement in the tracery of boughs overhead, while the shadows are hazy and diffused, very different to the clear-cut reliefs and sharp, crisp lines and masses of shade that belong to summer. This is the vast Cathedral of Nature; yonder at the end of the great natural nave is the altar, and from all around comes the breathless, silent worship of the drenched woods, hanging perfectly still in the quiet, evening air. Few lovers of forest scenery will find the mental transition hard, from the long, green aisles and avenues of trees to the arched nave of Gothic splendour. It is without doubt Gothic, this vast church of the woods. The severe beauty of its form, the almost awful purity of its conception! Endless rows of columns rising beyond each other, whence spring clustered lines of interwoven vaulting, where every line is a varied form of excellence, and every composite excellence is conducive toward a marvellous whole. Is there a cathedral built with men's hands that has such a west window as this, when the sun is hanging low in the heavens, and the sky is all aglow with its overflowing crimson? Where is the artist who could conceive that wide grandeur of proportion, or gain the secret of its colour? Yet it is the same but once; every evening sees a new design, a new scheme of decoration, and the only thing that is unchanging is its pervading beauty. Standing in the centre, and under the high arched roof of the forest nave, interlaced with intricate vaulting of dark wet boughs, and confined by pillars of green mossed trunks clustered irregularly in a strange weird scheme, there is but one name by which to define it—"Frozen Music!" No other phrase will express the vast gloomy aisles, the profusion of beautiful shapes, the wide springing roof showing black as the evening shadows descend, with that cold pallid blue filling up every space between the interlacing lines of bare wet boughs—"Frozen Music!" It was thus that Ruskin defined the higher forms of architecture, that Gothic which he loved so well. It is a description which relieves the mind of an overpowering oppression, for the highest forms of excellence—indefinable, without name—do oppress us with the mystery of their charm. There is sometimes a despairing lethargy born of the contemplation of great things, and if we understand this, the story of the legendary Italian painter who, conjuring up the spirit of the beautiful, wept at the awful aspect of his vision, is full of meaning to us. Thus our great cathedral window in the west is almost too humanly impossible to be without its melancholy. The eye is led to it by lines of arched vaulting rising each beyond each in an endless succession of new design; column beyond column superbly lead in the same direction. The chequered floor of changing mossy green and rich dull brown mingles in the long perspective with the overhead fretwork of boughs and dwindling pillars of gnarled beeches, whence they spring; making of the whole a hazy blur of shadow, but for the deep light and rich flaming colour shining behind.

Low in the heavens, almost level with the floor of the long aisle, which shows in places like some brilliant Byzantine mosaic, the great sun hangs. Its crimson edges are clearly defined against the evening mist, while, in front, the innumerable distant boughs show like the finest lace-work tracery against the broad red circle. This is the centre of our window, a low circular light with the long perpendicular shadows tonguing into the woods below it. Above radiate streamers of intense crimson, throwing into still stronger relief the confusion of higher branches before them. A weird intersection of lines stem the brilliance of the declining rays; yet there is a dimly felt scheme of wide design behind their confusion. Beyond them the streamers of light still shoot outward and upward, while the shadows grow longer, creeping in and thickening among the trees. The whole of the western heaven is included in our window now, with the masses of fleecy cloud burning with the red and golden beams. From the great round itself, fast sinking beneath the forest verge, through the press of branches to the open sky beyond, the light radiates with endless change. Outward from intense crimson it tones to a blushing gold, until the chill winter blue of the sky is warmed into a frail light primrose green, passing again into blue. I have often wondered why the woodland and forest should be left desolate throughout the winter. That it is so is undoubted; few visit the glades and slopes after October's mists have once descended and May's flowers not yet begun. Many avoid them because they hang wet and glistening all through the days, full of slowly shifting mist and deep shadow, and they deem them in these days but a dismal degeneration from summer glory. It is surprising how widely spread and deeply set this idea of the woods in winter has become. Few realise the uncloaked magnificence which is free from the glorious profusion of summer leafage. It was Goethe who said that "in winter we see the hand of God; in summer, his glove;" and there is striking truth in the saying. Winter shows the clear concise beauty unrobed—the nude of the world. It gives clearly the structural formation of summer magnificence. All is explained, yet still remains unintelligible. The stillness which is about the woods is full of latent force, the silence significant of latent tumult; and when this is manifested in one of winter's storms, there is nothing so grand or impressive as the giant oaks and beeches braving the wind with full front and waving arms, while the smallest spray springing from last year's fall of beech nuts is able to escape without harm. There is much that even the prosaic apostle of construction could learn here. Could he devine the secret of the strength of that small spray, or the law that makes the beeches and the oaks triumphant for a hundred winters over the storms, he would have little else to learn. But for the artist, the art worker, there are endless chances for acquiring inspiration and knowledge. Let him carry away one shape, one form of beauty, one perfect line, and reproduce it in his work, and he will have proved himself a real artist, and as such his work must show itself superior to the mass of artistic mediocrity around him. It has been ever the cry of the leaders of artistic thought, "Go to nature for your inspiration and material," but in the main it has been disregarded. Yet before we attain that supremacy in art which so many are striving for, this must be accomplished. Meanwhile, the fields and bare brown hedges lie waiting, and the woods are only retrieved from the reproach of solitude by a few wayfarers and the robins upon their outskirts, while the deer, the fox, and the badger hunt in the thickets and beneath the fern unmolested. F. B.

On Reflection.

London's New Street. The great new thoroughfare which is to be constructed between Holborn and the Strand is arousing a considerable degree of interest even in circles where questions of building and street making are not usually regarded as matters of vital concern. The boldness and magnitude of the scheme seem to have impressed the popular imagination, and many suggestions have been made with regard to various details. One matter which, judging by the correspondence columns of some of our daily contemporaries, is exercising the ingenuity of a good many people is the best name for the new street. The street names of London are a constant source of interest to the historian and the antiquarian, recalling persons, events, and conditions of life that have long since passed away; such names as "Ludgate," "Charing Cross," "Holborn," and "Paternoster Row" are concentrated chapters of history, and it is desirable that the name of the new street should have some historic value as a memorial of our own time. Many of the suggestions that have been made are not without a certain appropriateness, though we have not seen one which has the quality of inevitableness which belongs, for instance, to such a name as "Rhodesia." But some are vitiated by the fact that they will be almost meaningless to a future generation, being obvious references to persons or political events that happen for the moment to bulk largely in the public eye; while others are too fantastic to appeal to a sober-minded and matter-of-fact people. But, after all, it is not the name that chiefly matters; the great thing to which all efforts should be directed is that the new street shall be as beautiful, as dignified, and as serviceable as the highest engineering and architectural skill, backed by a generous and public-spirited municipality, can make it. A narrow thoroughfare, flanked by mean buildings, would not be rendered respectable by being called "Imperial Avenue," nor would a road after the model of the Thames Embankment, with a rotten substratum and an undulating surface, be any the less a disgrace to the metropolis if named, as one correspondent suggests, "Millenium Causeway."

The Pedestrian's Complaint. It has often been remarked that the outsider sometimes sees a defect or hindrance quicker than the specialist, as his position is a free one, and he is not hampered by any trade or professional prejudice. For years past the man in the street has been protesting against the current methods of carrying on building and repairing operations. Take, for instance, the case of a house being built at the side of the pavement. It is very usual to put up a rough hoarding about 10ft. high, with one opening left through which materials can be passed. The result is that, in the case of bricks, there is one man near the opening receiving the bricks from a man in the cart alongside the pavement, and while this process is going on the pedestrian has either to wait for a stoppage or to make a circuit round the cart in the street. In provincial towns this is objectionable enough, but in cities where the traffic is considerable and congested, the nuisance is increased tenfold. The many narrow thoroughfares of London offer good examples of this nuisance, which is nowhere more noticeable than in the Strand and Fleet Street. Both these thoroughfares have carriageways and footways of insufficient width, and it has often been a matter of great surprise to foreigners that the most important thoroughfare in the "City of the Empire" should possess such defects. During business hours the overcrowding becomes so dense that progress is retarded to a most aggravating extent, and it is therefore not desirable that a further obstacle should be introduced by men throwing bricks from a cart. Of course, houses must be built and the bricks must be taken in somehow; therefore, says the builder, what is the use of making a fuss about it. Workmen, and British workmen especially, are very suspicious of any changes in the time-honoured practices which they have been taught are infallible, and this perhaps is the reason why antiquated and inconvenient practices survive so long. For years past several alternative methods to the one now current for taking materials into buildings have been at the disposal of contractors, but opposition has been made on the ground that mechanical appliances would take the place of hand labour and would therefore diminish the numbers of workers, though the experience of the past tells strongly against such a supposition. A suggestion we might make in connection with the handling of bricks in streets is that a framework, say about 8ft. high and 6ft. wide, should be erected over the pavement at one point, to carry a platform on which a man could stand and receive the bricks from the man in the cart. This would cost but little and would only mean throwing the bricks up instead of down, while the pedestrian would not be put to the inconvenience which he experiences under the present system.

Street Excavations. While dealing with this question it might be well to refer to the altogether unnecessary frequence with which excavations and digging operations are carried on in the streets, for the purpose of laying or examining mains or pipes of one kind or another. It appears to be considered proper that on the slightest occasion the surface of the road shall be torn up and a heap of earth thrown on the side, with the result that the vehicular traffic is stopped altogether or diverted, and the pavements become covered with soil. If all mains were carried in subterranean tunnels or subways there would be no necessity for disturbing the road surface; the expense of such subways would, however, preclude their adoption in the majority of places. At the same time this wholesale street repairing, which is complained about all over the kingdom, should be stopped and a certain stricture enforced. A very absurd case occurred a short time ago in the provinces. One company was carefully laying a new street and making crossings with well-squared setts, while fifty yards or so behind were the gas men tearing up the surface to put in their pipes. This is, of course, an extreme example, but it tends to emphasise the purport of these remarks that when streets are excavated for the purpose of repairing or laying pipes every effort should be made to see that the job is thoroughly done and that provisions are made to avoid the necessity of returning to the work within a short time. Unfortunately, such prospective considerations do not at present receive much attention.

"'SPECIFICATION' is a revelation."

BRITISH PLASTERWORK, PAST AND FUTURE.*

By GEORGE P. BANKART.

(Continued from page 175, No. CCXLVI.)

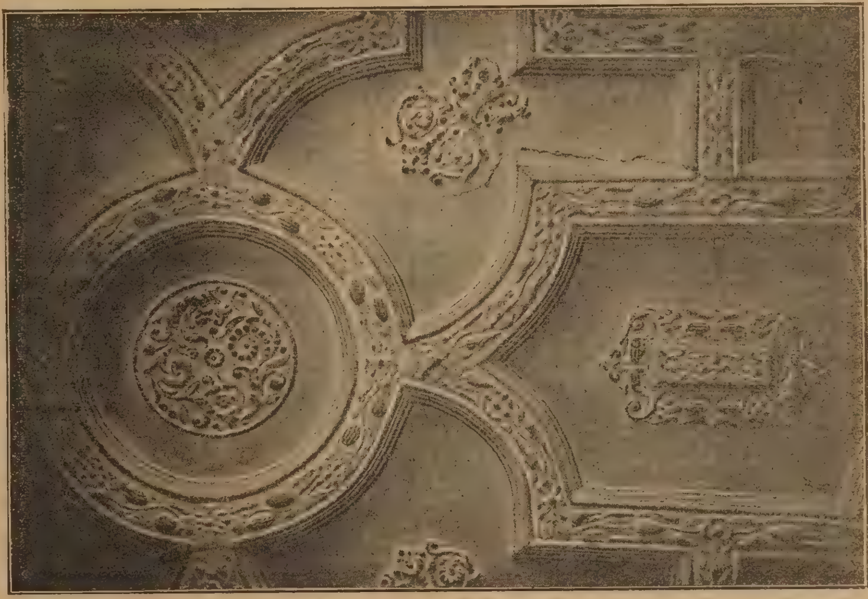
WILLIAM III. and the more settled state of affairs again revived the art, and the Italian influence flickered for a time; but, eventually, the character of the work became that of Louis XIV. and XV. of France, in which style the English workmen became proficient. Gibbs (Wren's pupil) patronised the art by encouraging the Italians, Artari and Bagutti, whose work is to be seen in the churches of St. Martin's-in-the-fields, and St. Mary-le-Strand, and also at Cambridge and elsewhere. In the meanwhile the English craftsmen were working in the French style, consisting of twisted and tangled lines of various kinds, which pleased the light glance of the French spirit, but proved offensive to the English nature. Chamber's influence helped the art again, the character becoming once more severe. Then came Joseph Wilton, Thomas and Charles Clarke (1783), whose best work is to be found in Ireland, where many good eighteenth century ceilings exist. The brothers Clarke also worked at Somerset House. Joseph Rose and his pupil, John Papworth, and Thomas Papworth, about the last survivor of the line of designers, died in 1814. Then followed the compo work of the brothers Adam, which replaced the old work in an insignificant manner, and then the nineteenth century period with centre flowers and other stuff, with which we are all too familiar.

The work of the sixteenth and seventeenth century had a charm apart from the design, which "told" in the success of the whole. The plain surfaces are not hard and die level, but full of slight undulations. The plaster itself was widely different from that we are accustomed to use now. Examine a piece of old plaster from one of these ceilings, and you will find it coarse and rough, often full of little bits of gravel and other substances which our modern "specification-architect" would probably condemn. This very roughness and coarseness give the texture to the plain work we so much envy, and it is this quality we altogether miss in our modern work. The ribs and strapwork of the old days lack that mechanical rigidity and exactitude which turns our modern men into "compasses" rather than human beings; and, again, the old work is devoid of that strain and limit of mind, born of the T-square and drawing-board, that makes everything fit with the exactitude of machinery for a working-purpose (see illustration on this page). The design will be curtailed and altered in places where circumstances would otherwise make certain forms awkward. Figures near enough for circles were turned into horse-shoes, a rhomboid would turn into a pentagon by the intersection of a wall line, and things twisted and turned to meet emergency in a manner that could not be foreseen or realised on a drawing-board or anywhere but in the place itself.

All was done, then, more by eye and hand judgment than by measured exactitude. The workmen had his tools, his models, his traditions, and was content to do his day's work at a very much lower wage than our plasterers demand now. Probably he may have had some rough plan for guidance, which was all that a good workman needed for setting out his main lines. That they had models and moulds is proved by the fact that one may not only find the same pattern in different rooms of the one house, but in different houses about the country. Bands of ornaments used in a ceiling will be found combined with another ornament in a freize somewhere else, or even filling the spandril on a wall between cornice and roof, as at Merton College, Oxford, at Hatfield. Squares, bosses, heraldic bearings, and other enrichments filling the spaces between the ribs of a ceiling, will be found combined in an overmantel or wall treatment in another room, as at Plas Mawr, Conway (see illustration). Some portions will be modelled with metal or wooden tools, some parts with the fingers, and this is evidence enough to show that the lime was then of a very different character before being worked to that with which we now cover our walls and ceilings, or no man's fingers could have worked it. The lime must have been very old and thoroughly deadened by slaking. In countless other ways the work was different to ours. Some ceilings were rendered on lathing, some on rough withies, some on reeds and rushes. The country is full of fine examples of old work, but every year some are hastened away to make room for modern material.

Present Day Plastering.

At the present day the materials readily attainable and commonly used that can be used for modelling, are, for *in situ* work, lime and ox-hair, Parian cement, selenic cement, and Keen's cement for the interior of buildings, and Portland cement and ordinary lime, sand, and ox-hair for external work. Plaster of Paris and lime putty is cheap and handy for casting and fixing purposes. None of these materials will prove so durable as the Italian "stucco-duro," nor are they capable of such fine treatment or effect, nor possess such fine modelling qualities. The stucco-duro is, however, out of the reach of ordinary persons on account of the difficulty and expense in procuring the marble dust. Nevertheless, much can be done with these common materials when worked with metal tools, or with plaster of Paris, cast in a simple way. The wall or ceiling should be treated in much the same manner for any of these materials, being first of all coated with a coarse but sharp plaster, which should be well scratched and "scoured" to receive the second and finer backing before the former is quite dry. This second coat should be of the same material as the modelling to be afterwards applied to its surface. When the second coat is set, the design is drawn in chalk on its surface, and the portion to be covered with the modelling cut away or roughened with a sharp instrument. This done, and the surface well damped with water, the modelling material is applied at will and discretion. This brings us to the most important part of our subject.



CEILING IN HOUSE AT BROMLEY-BY-BOW (1606).

It is of no little interest to note how the study of Nature influenced the art when it was first introduced into England. At that time craftsmen took their inspiration from Nature, possibly because the craft was new and held no traditions which could be followed. Whatever the cause might be, the effect on their art was the reverse of the fate of the other crafts, whose traditions were paralysed at the time of the great upheaval. The plasterers' craft was inspired with a new life and freedom, strongly akin at times to the wonderful work at Venice, and to the early Gothic work. Simplicity is the root of success in nearly all the best work of the past, as it must be of the future. In this work there are no tricks of the modern workman; all is quiet, honest, simple modelling, without any of that strain and consciousness of law and principle we are sometimes taught to obey in schools of design. There are no sharp curves, no undercuttings, or sparkle of effect that might be the natural and desirable quality of another material. On the other hand one has gentle curvature, little variety of relief, and a dullness that is the charm of a soft material, coming far short of realism, as admittedly it must and should. In old work grapes were just sufficiently like grapes to be recognisable and little more—the rest was impossible, undesirable, unnecessary, beyond the limits of material, and convention, once honourably admitted, was maintained with a vigour and spirit only possible to an honest purpose. Although the work was lacking in realism it was yet inspired from Nature so far as it went, for it at any rate expressed that freshness and vigour of growth which is the vital quality in Nature. With such limited means at hand, the plasterer contented himself (rightly) with this mere "suggestion" of nature in his work, and compromised matters between his material and the suitability of his design to the material.

So it must be with the modern craftsmen. Design will only come by designing, and by no other means, and if we can only get a certain amount of rhythm and harmony into our work, it is at least bound to be interesting, though perhaps mistaken, no matter how primitive, awkward or dull modelling may be. Dullness is, in fact, a right quality for a material such as plaster, and no more than honestly reveals the process of workmanship, by such means as pressing and adding soft material to a prepared background of a similar nature. In a material so susceptible to the slightest touch, this feeling is particularly desirable in the treatment of large surfaces.

The carver attains his result by subtraction, so the modeller should attain his by addition, economy of labour with the best possible result being an object with both, according to circumstances.

We are sometimes accused of having no "*style*" characteristic of the nineteenth century. This may be true, according to the nature of the statement, but on the other

"SPECIFICATION' has the world for its field."

hand we appear rather to have a style very far from being at all creditable to either our institutions of learning or to the public, whom these institutions are supposed to safeguard. One may perhaps feel justified in thinking that there may be a change in the future. Let us hope it will be for the better, and that we may have a national decoration founded on something else besides the Acanthus leaf, beautiful as it is. If we have no style, let it be remembered that we have a few men of sterling worth and ability who are producing work of great interest and beauty, men who may, with that help and encouragement which is their due, indirectly establish and train up a school of craftsmanship and thought that may not be despised by future generations, as ours threatens to be.

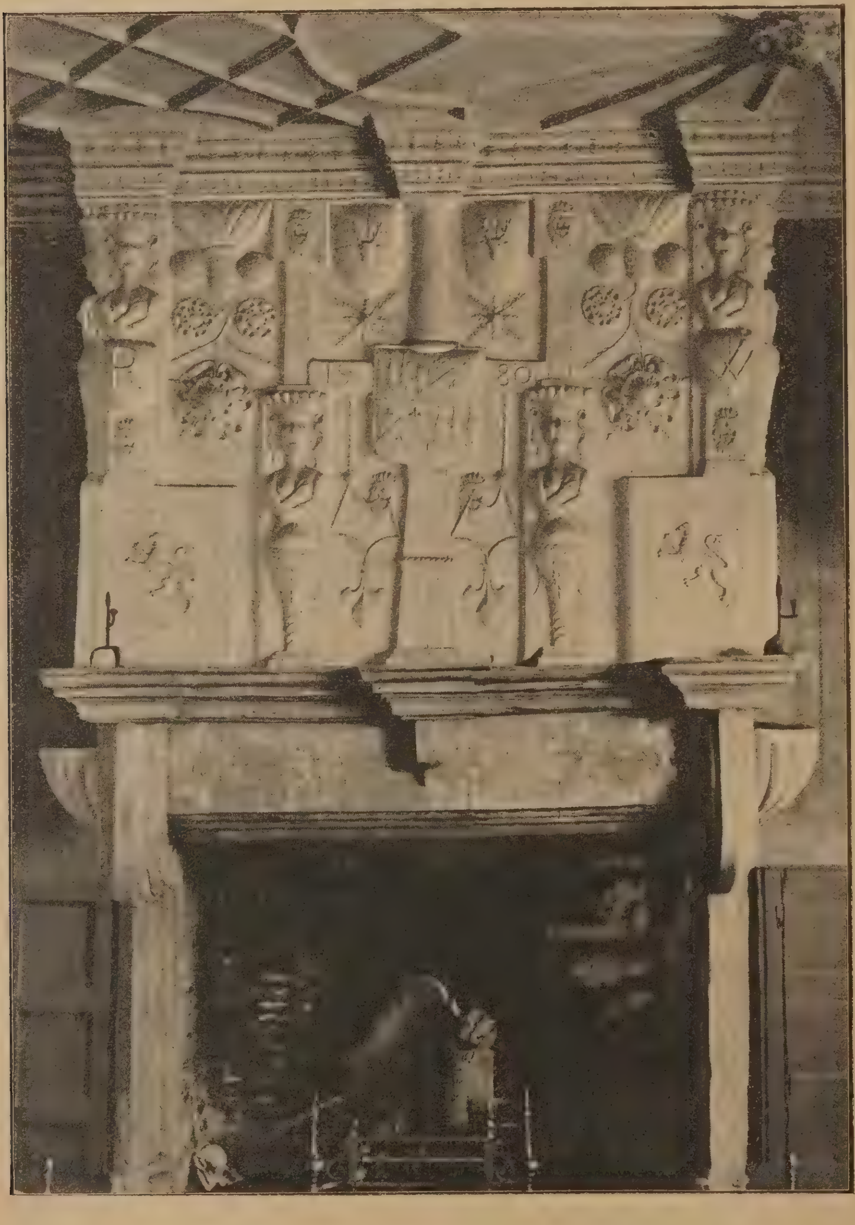
* A paper read before the Leeds and Yorkshire Society of Architects; redelivered to the Leicester and Leicestershire Society of Architects.



OVERMANTEL IN BANQUETING HALL, PLAS MAWE, CONWAY. SHOWING USE OF MOULDS FROM CEILINGS.

But this can only be brought about in one way, namely, by giving up professionalism as far as possible and getting out of the ruts which have been made for us by the "professional gentleman," by descending from our high stools and doing something real. The moment it is found that something real is being done, substantial paper design becomes less necessary, and, to a certain degree, vain and superfluous. I now address myself chiefly to those about to enter the profession, for it is to them that we must pin our hope and trust. The "profession" has become too callous and indifferent to think for one moment of trying to influence clients even to look at better things, so long as "ghosts" can be obtained to slavishly dole out designs in cut and dried styles.

We want more men of refined and strong nature working at our crafts—young men—who know the difference between design and the intellectual poverty of imitating old styles. There is plenty of demand for good individual work amongst men of a certain rank, but the supply is very limited. There is much to be desired from the plumber beyond the purely hygienic side. How many plumbers have we who can design and make a beautiful lead finial, boss, or rainwater head?

In the Middle Ages the country was full of such men, or London would never have been the "city of leaden spires." If we are again to have good work done we must draw blood from our own ranks and co-operate in craftsmanship.

There are men, now, who have been trained in "the profession" who have devoted years to the study and practice of architecture, who have abandoned professional "practice" as a failure, and are now working at some craft with great results, men whose names are household words amongst architects and artists.

And now, touching the most delicate and important part of the whole subject, that of the design of modern work.

So much wisdom and eloquence has been put forward on this subject of late years by men of undisputed genius that nothing new remains to be added. At the same time, a certain state of affairs exists that must be looked in the face and combatted again and again before a healthy reaction is possible. Far more may be achieved by doing than by talking. It is workers that we need, more than lecturers, and it is sincerity that the worker will find his most faithful accomplice. Given the worker and sincerity, they must walk hand in hand with Nature, the mother of all things. But the gift of selection, the first great gift for the designer of decoration, what of it? We must first of all throw aside professionalism, and take up the actual material. It is then we find out the helplessness of designing on paper, and the helplessness of ourselves. Being able to draw is not being able to design, and before we are able to design legitimately and naturally in any material we must have served a pupilage, or have held constant intercourse with the great works of past ages, and have learnt from them how things were done, and why. We must also be in touch with living men who practise crafts, so that their aims and their methods are familiar to us before we begin to dabble in design for ourselves.

At the present day we are deceived by our teachers, and begin at the wrong end of the journey. We are taught to believe that learning to design is one and the same thing as learning to draw designs. Set to work in a material of which you are ignorant of the capabilities, and you are soon undeceived. The consciousness of this fact compells you to set the imagination to work, and you fall back on precedent. Paper work designing is quite vain, in that it is hardly possible for one man to convey the vision or spirit of another without losing much: the essential quality in particular. The capabilities and limitations of a craft must be ours by personal acquaintance, by natural perception, the knowledge ingrained in us and born of actual hand service in the material itself, and in the art of working it. The degree of our art is according to the amount of delight we take in the creation surrounding us, and design is the expression, the impression of this delight conveyed in a harmonious manner, according to the limitations of the material selected. I would suggest then, that the true basis of future design lies in simplicity itself; that we clothe our construction, where desirable, in the simplest possible manner, yet indicative of the construction we cover; that we go to Nature for our ideas, and learn from past ages how to express them; that this expression be harmonious in arrangement, *i.e.*, decorative—suitable to the purpose, and to the position it is to occupy in the surrounding work, expressive to the highest degree of the virtues and limitations of the material in which it is expressed, and not imitative of the textures and natural effects of other materials of foreign natures.

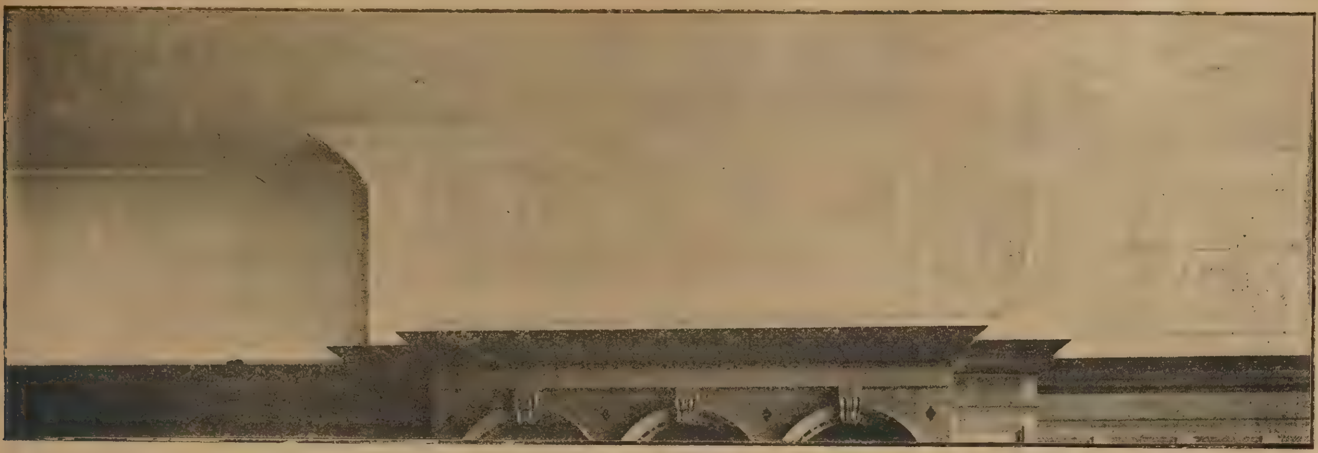
I would further suggest that our "thought stuff" be localised as far as possible; that our decoration might in some way or other be suggestive of place, surroundings, perhaps of the particular industry that might happen to be associated with the life of the neighbourhood. A village club room, or other rural building in any way associated with agriculture, might be inexpensively decorated with such subject material as rabbits, squirrels, cocks and hens, chickens, horses, men ploughing, and similar things. Buildings near the coast might even be treated in the spirit of the Fish Room at Audley End, by the introduction of aquatic forms, &c.

Flat or slightly curved bands, plain, enriched, or spotted at intervals with enrichment in either low or high relief, according to circumstances, might replace our objectionable hard "run" cornices; or cornices might be modelled in clay and cast simply moulded or slightly enriched. Such cornices are infinitely superior in appearance to those now commonly used.

Far more might be done than is done with the nice arrangement of straight lines and slightly undulating curves before resorting to the more hackneyed and convulsed forms.

Our modern decoration, as a rule, somewhat

"'SPECIFICATION' is a veritable encyclopædia."



PORTION OF FRIEZE, CHISLEHURST, KENT. DESIGNED AND MODELLED BY GEO. P. BANKART.

resembles our buildings, which so often sit uncomfortably on their site.

In short, let us look at the work of bygone craftsmen, study, reverence, and cherish it, and try to do modern work as they did. I do not say be original; there is no such thing, except so far as being oneself and reporting accurately what we see and are. All good work has been accumulative and always must be so. Each generation must base their knowledge on the last, and so build up an increasing tradition for those who follow.

But how is this to be done? I would add that the responsibility lies with you, to give that right and just encouragement and opportunity which is necessary, not only to the supply of good work, but to the possible chance of any new school of thought that might be formed, live, and flourish with proper nourishment.

Each individual is as much responsible for his actions in this respect as the mass of architects, and more is dependant on individual action than on the mass, as the mass is made up of individual action in co-operation.

It may be advanced, how are we to know when we are doing the right thing? How are we to know when we are encouraging the right men? How are we to know what is beautiful? Only so far as this, that as we are familiar with the best work of past ages and became ourselves good workmen just so far may we be qualified to judge.

Our great hope is then, that our younger members should not think the practising of a craft as unworthy of their attention, or even of their ambition, and that the craft may be brought within the reach of modest persons, suitable to its purpose, and not necessarily expensive; "for the distinction and end of a soundly-constituted man is his labour, and use is the end to which he exists."

WYCH STREET: ST. CLEMENT DANES.

By JOHN HEBB.

It is difficult to realise that the neighbourhood of Drury Lane was, in the reign of Queen Mary and down to the accession of William III., an aristocratic suburb, but such it was. Aldwych was the name of a district extending from Broad Street, St. Giles's, to the Strand, which was traversed by a street originally known as the Via de Aldwych, a portion of which is now known as Drury Lane, "for that there is a house belonging to the family of Drury," as Stow says, and the remaining portion as Wych Street. The neighbourhood was once sufficiently fashionable to be the dwelling-place of a king's mistress, for Pepys relates, in an oft-quoted entry in his diary, how, on his way to Westminster on May Day, 1667, he saw "pretty Nelly standing at her lodging door in Drury Lane in her smock sleeves and bodice" looking at a dancing milk-maid, and that she seemed "a mighty pretty creature." The name Aldwych, according to Parton ("History of St. Giles's-in-the-Fields"), appears to be a compound of the Saxon word *Ald*, old, and *wych*, a village, and plainly indicates that the locality was inhabited before the Norman Conquest, and probably gave origin to the village of St. Giles itself.

It does not appear at what time buildings were first commenced in the neighbourhood of Drury Lane, but among the St. Paul MSS. calendared by H. C. Maxwell-Lyte (Appendix to the Ninth Report of the Hist. MSS. Commission) is an acquittance of the Dean and Chapter of St. Paul's for rent issuing from a new garden lately belonging to John Bosham, adjoining his great inn in Aldewych *extra la Temple Barre*, on which three houses formerly stood, temp 6th Henry IV. (1405); from which it would seem that the district was partly inhabited early in the fifteenth century.

From the Angel Inn, at the bottom of Wych Street, Bishop Hooper was taken to his martyrdom at Gloucester in 1554.

The two houses, Nos. 45 and 46, Wych Street, on the south side of the street, of which we give an illustration in our centre plates, are good examples of London architecture of the time of James I.; they are constructed of wood, plastered externally, and overhang the street to the extent of three feet. Holywell Street, Drury Lane, Wych Street, and the adjacent streets are scheduled for the purpose of constructing the proposed new street from the Strand to Holborn, and with them will disappear many specimens of London buildings before the Great Fire.

In Seymour's "History of the Parishes of London and Westminster, 1734," Wych Street is thus described: "Wich Street begins at the Angel Inn" (the house whence Bishop Hooper was taken to his doom); "it is a street much taken up by upholsterers for the sale of bedding and secondhand household goods. In this street is New Inn, another of the inns of Chancery, and here the students of Strand Inn settled when that house was pulled down in the reign of Edward VI. for the building of Somerset House."

There is a tradition that in a narrow court out of Wych Street Jack Sheppard served his apprenticeship to Mr. Wood, a carpenter, but there seems but slender foundation for this tradition. Jack Sheppard expiated his misdeeds at Tyburn in 1724, and there is no doubt that at that date the once fashionable neighbourhood, which begun to deteriorate soon after the accession of William III., had become the resort of bad characters of every description, and that it was then a neighbourhood (as Gay sings in his *Trivia*):

> Where Calvert's butt and Parson's black champagne
> Regale the drabs and bloods of Drury Lane.

The Studio of the Late Sir Edward Burne-Jones, at the Grange, West Kensington, has been hung with about fifty of his works—some unfinished—and is now open to students and the general public on Saturday and Sunday afternoons from two o'clock till dusk. Entrance to the studio is in Lisgar Terrace, West Kensington.

AN IDEAL CITY.

MEETING OF THE GARDEN CITY ASSOCIATION.

IN our last issue we published an interview with Mr. E. Howard on the subject of his proposed "Garden City," which is designed to afford a healthier and happier urban life than is at present possible. The first annual meeting of the Garden City Association, which has been established to advance the project, was held at the Memorial Hall, Farringdon Street, E.C., on Thursday evening last. The chair was taken by Mr. William Woodward, A.R.I.B.A., who was supported by Mr. Branch, L.C.C., Alderman Fleming Williams, L.C.C., the Rev. Thomas Child, Mr. Henry Holiday, and Mr. E. Howard.

Letters of sympathy with the objects of the association were read from Professor Russell Wallace, Canon Barnett, Mr. Walter Crane, Dr. Paton, Mr. Holyoake, and Mr. T. E. Young.

The secretary read the report of the executive committee, which stated that twelve sections had been constituted, viz., finance, literature, lectures, and public meetings, land tenure, manufacturers and trade, co-operative societies, labour, housing, liquor traffic, education, art, music and recreation, domestic economy, and health. The finance section had now under consideration the formation of a proposal for carrying out the ultimate object of the association, and in particular the best way of obtaining funds by means of a trust or otherwise. Press notices had been very numerous, and generally favourable, although the journals had represented very diverse interests. A number of manufacturers had given their adhesion to the scheme. The committee impressed strongly upon members the absolute need of a permanent substantial income to enable the association to promote its objects and aims by educational means.

The report was carried, and the honorary officers of the association were re-elected, as also the council.

The chairman said he had for many years taken the greatest interest in all that concerned the beautifying, the health, and general well-being of the metropolis. Two projects of his were, after eighteen years' work, likely to be entered in the lists of practical completion. The first was the opening of the Mall from Charing Cross to Buckingham Palace, and the second was the street from Holborn to the Strand which the L.C.C. was now considering. Had the plan which Sir Christopher Wren prepared after the great fire of 1666 been adopted there would not be the congestion of traffic and the narrow thoroughfares which at present existed in the city of London. Mr. Howard's scheme to establish an ideal city some distance from London, which provided for the healthful recreation of the inhabitants was a combination of the ideal with the practical; and as an architect he was fully convinced that the project was perfectly capable of a profitable realisation.

Mr. James Branch, L.C.C., moved the following resolution: "That the solution of the housing problem is to be found in a well thought-out project for removing congestion in crowded centres by attracting manufacturers and others to new areas, arrangements being made for securing to the migrating people the whole increased value which their presence would give to the sites, and the areas being carefully planned so as to make adequate provision for the individual and social needs of the people, especially with a view to securing for all time the combined advantages of town and country life."

The object of the scheme, he said, was, if possible, to combine with commerce the possibility of living a happy and healthful life. He had been asked by friends why the association did not get the money required before dividing itself into committees for considering the scheme. In his opinion it would be very much better to leave the money part of the question alone at present, because even if the money was forthcoming it would be perfectly useless. The result of the committee's work must be known before it was desirable to use the money. When the proper time came and society understood the project he had not the slightest doubt that the money would be forthcoming. At the last meeting of the L.C.C. a very large sum was voted simply to clear insanitary areas. Something must be done not only to purify those insanitary areas, but to find accommodation for the people. In the poor parish which he represented there were 500 families living in one room—one room to each family. He believed that Mr. Howard's scheme was the wisest and best project for the solution of the housing problem which had yet been discovered. As to manufacturers going to Garden City, if in two or three years' time he found it advisable to extend his business he should be very glad to go and make a start in the colony. There were those in a very much larger way of business than himself who would be looking about for a position in which they could do their work successfully. A great many manufacturers were rising out of the mere drudgery of making money, and were beginning to realise that if they wanted a happy life and a successful business they must carry their workmen up with them, and to realise that in the future it would be impossible to have one man at the pinnacle and the people at the base.

Alderman Fleming Williams, speaking from his experience as an administrator, declared that some such scheme was becoming increasingly necessary on account of the terrible over-crowding which prevailed in the poorer parts of London at the present time. An enormous amount of money was being spent in clearing the ground on which these insanitary and fever-stricken dens stood. That meant that thousands of people would be turned out of their homes without any provision being made for their future accommodation. Garden City would probably be erected by private enterprise, but private enterprise dictated and controlled by a chivalous regard for the common welfare. He believed there were enough men to do it, and a great many men in prominent positions in the industrial and social world were holding back simply because they were afraid of identifying themselves with a scheme that might turn out to be a failure, owing to the indifference of the public to their true interests. But the moment they saw that there were earnest men and women behind it, who resolved to do something to diminish the hideous suffering which was crushing out the life and soul of the people—the moment they were convinced that it had behind it a moral enthusiasm, and was not likely to be discouraged by initial difficulties, those men would come forward and offer their co-operation.

Mr. Henry Holiday hoped it would be possible to secure that the buildings in Garden City should be built under the auspices and guidance of those who had made beauty and wholesomeness in houses a study. As the land on which Garden City was to be built was to be obtained for the benefit of the community that lived upon it, the foundations would be laid in the noble Divine principle of brotherhood. If the superstructure were worthy of the foundation the houses would be raised in the same spirit. The motto of Garden City ought to be: "Whatsoever things are lovely, think on these things."

Mr. Foat (Aylesbury) asked whether the mechanic who came from London to Garden City had to take enough money with him to build his own house.

Mr. Howard replied that in some cases the individual might have enough money to build his own house, but he was certain that if there was sufficient public spirit in the country to buy the land for the purpose of making the experiment proposed, there would be public spirit enough to take care that the houses were built in the very best way, and under conditions that were desirable from every point of view. The resolution was carried unanimously after a little further discussion.

Mr. F. W. Flear moved: "That this meeting pledges itself to support the aims and objects of Garden City Association." He suggested three ways by which those who were in sympathy with the association could aid it—(1) By giving their personal co-operation; (2) by making their influence felt wherever they went; and (3) by subscribing to the funds of the association.

Mr. Howard said that he hoped shortly to issue a cheaper edition of his book. He made a strong appeal to the members to have a little faith in the possibilities around them. The project could be carried out within a few months of the present time, if all were equally determined and earnest about the matter. He felt sure that great results would be accomplished within a very short time.

The meeting terminated with a vote of thanks to the chairman and to Mr. Howard.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

BY G. A. T. MIDDLETON AND R. W. CARDEN, ASSOCIATES R.I.B.A.

(Continued from page 163, No. CCXLV.)

VI.—MATERIALS.

1.—(*a*) *Give the names of some of the principal varieties of limestone in common use. Also state which you would prefer for use at a seaside town subject to severe gales; and why?*

(*b*) *Give the names of the cements used; firstly, for exterior rendering; secondly, for exposed angles internally; and thirdly, for mortar in brickwork which has to carry concentrated loads, and the reason why.*

(*c*) *What lime would you use; firstly, for mortar to be used in exterior work; secondly, in internal plastering; and how would you test the same? How would you gauge mortar for brickwork and first-coat plastering respectively?*

(*a*) Bath stone (Box Ground, Corsham Down, &c.), Portland, Ancaster, Ham Hill, and Doulting. For an exposed situation the limestone selected should be as compact as possible. Doulting stone, used in Wells Cathedral and Glastonbury Abbey, is, perhaps, as good as any for the purpose, as it has stood the test of centuries of wind and rain with marked success.

(*b*) Cements for external rendering:—Portland cement is the most generally used, in the proportion of one of cement to three or four of sand for rendering, and one of cement to two of sand for finishing coat. This is the most economical and satisfactory method of excluding damp, &c. Roman cement also is often used in place of Portland, especially where much moulded work has to be executed, but the work is not so durable. Cement for internal angles:—Keene's cement, or Parian cement, as these are capable of being worked up so as to set very hard and will take a very sharp arris. Cement for mortar:—Portland cement, this is the best for all purposes when sufficient time can be allowed for it to set properly.

(*c*) Lime for mortar:—This should always be hydraulic, such as blue lias lime (from Lyme Regis, Watchett, &c.), these being limes which will set without the assistance of external influences. Lias lime should be used in works where great strength is required. Lime for internal plastering should be calcined from carbonate of lime containing not more than 6 per cent. impurities; these are fat or rich limes. The lime for this class of work should be run at least three weeks before it is required, so as to ensure perfect slaking. Imperfect slaking will probably entail "blowing" when the work is completed. Gauging mortar:—The mortar used for brickwork to be composed of three parts clean,

"'SPECIFICATION' No. 4 maintains its high reputation."

sharp, pit or river sand to one part fresh burnt grey stone lime, well mixed together in quantities sufficient only for each day's use. Gauging first-coat for plaster work (run as mentioned above):—The coarse stuff to be of well burnt grey stone lime, sharp, well-screened, clean, freshwater river or pit sand, and good, long cowhair, free from grease and other impurities; mixed in the proportion of one of lime to two of sand with 1lb. of hair well incorporated with every 3 cubic ft. of stuff.

2.—(*a*) *State the kind of brick you would use in a first-class brick-faced building with stone dressings: firstly, for facings; and secondly, for internal work; also, how would you test the quality of the bricks in a practical way.* (*b*) *Which do you consider the best tiles to use in a building in a district subject to a heavy rainfall, and why?* (*c*) *Which are the best known green slates? How would you test the quality of a slate in a practical way?* (*d*) *Is red terra-cotta a desirable building material for outside work by the seaside?* (*e*) *What is the difference between balk timber and scantling timber? Which of the two do you prefer to use, and why?*

(*a*) For external work: Fareham red bricks or "T. L. B." Reds, or other approved makes. For internal work: Good hard well-burnt stocks of good shape, or Fletton bricks. Practical tests for bricks: When two are knocked together they should "ring" with an almost metallic sound. If the sound is dull the brick will probably be soft and not fit for use. The absorption of water should not be above 15 per cent. of the weight of brick. In shape they should be true and square with sharp arrises: when broken they should present a homogeneous texture.

(*b*) The best tiles for any position are those which will absorb the least quantity of water; consequently only those which are very dense and tough should be specified. "Broseley" tiles are generally conceded to be the best, being very slightly vitrified, and as nearly as possible non-absorbent.

(*c*) The best green slates: Elterwater, Buttermere, Tilberthwaite, and most of the slates from the Cumberland and Westmorland quarries. The best test for slates is that of absorption, which may be applied in two ways, by standing the slate on edge in water to a part of its height and observing if the water "creeps" up towards the top; or by weighing the slate before and after it has been saturated with water and noting the difference in weight; this should not exceed $\frac{1}{200}$ of the weight of dry slate.

(*d*) Red terra-cotta (if good) is as suitable for use in outside work at the seaside as any other material. Its quality depends upon the suitability, preparation, and burning of the clay of which it is composed. The surface of the finished work should be absolutely free from cracks or flaws, and each block made exactly to fit the place it is destined to hold in the building, as cutting or rubbing, after the burning of the blocks, is fatal to the durability of the material. Where dowels or clamps are used they should be of copper, and in the present case it might be advisable to cover cornices, projecting mouldings and the like with a protecting layer of lead or asphalte.

(*e*) "Balk" timber is the name applied to the "logs" (trees which have been felled and the branches lopped off) which have been roughly squared. "Scantling" timber consists of the various scantlings (planks, deals, and battens, &c.) into which balk timber is converted. Scantling timber is the best to use, being cheapest in the long run, and timber in small sizes is more easily examined with regard to its suitability for any particular position.

3.—(*a*) *Give the names of some genuine white lead used in oil paints. Which is the best, "old" or "new?"* (*b*) *What is driers, and how should it be used?* (*c*) *Is lead a good material to use for cisterns and water pipes? Give the reasons for approval or objection.* (*d*) *Describe the lead you would use for a large flat.* (*e*) *Is it advisable to use zinc soakers under lead flashings? Give reasons.*

(*a*) Genuine white leads: Krems or Vienna white, French white, London white, Newcastle white, &c. "Old" white lead is the better of the two.

(*b*) Driers are substances which, when added to oil paints, hasten the oxidation of the oil (sugar of lead, litharge, &c.). The choice of driers depends very largely upon the pigments with which they are to be used, some assimilating themselves to one pigment better than others; for instance, lead driers should not be used with oxide of zinc paint. They should never be used when unnecessary, nor, when necessary, should they be used to excess, as this retards drying. They should not be added until the paint is about to be used, and should not be added at all to the finishing coat of delicate tints.

(*c*) Whether lead is, or is not, suitable for water conveyance and storage depends principally upon the water itself. The waters which act most freely upon lead are "soft" waters (rain water, &c.); the "hard" waters having little or no effect. In the country, where the water supply is obtained from uplands, the action of the water upon lead is likely to vary at certain seasons, and in this case it would be best to avoid the use of lead for service and storage; but in localities where the water supply is known to be invariably "soft," and where the amount of plumbo-solvency remains constant, or practically so, the deleterious action upon lead may be avoided by the addition of carbonate of soda in the proportion of about one volume of the carbonate to 20,000 volumes of water. In other cases the addition of powdered chalk in the proportion of two grains per gallon of water has proved efficacious. From the above notes it is clear that lead poisoning, the only objection to the use of lead, may be easily avoided if the water supply is kept under reasonable supervision. Lead has many advantages, being easily turned round angles, easily jointed, &c., and is the best available material for the purposes under consideration.

(*d*) Lead for a large flat: The lead should be 7lb. milled lead on rough boarding, carefully dressed over wood rolls, the under-cloak covering about two-thirds of the roll and the over-cloak carried right over this and dressed flat upon the level towards the least exposed side (that is, if possible, facing an adjacent wall). The lead to be dressed up 6in. against wall, and covered with a 5lb. lead apron 6in. deep, the upper side turned into jointing of brickwork and secured with wooden wedges.

(*e*) It is not advisable to use zinc soakers under lead flashings. In the first place, while lead was being used for the flashings it is not probably that any craftsman would think of making the soakers of any other metal. The juxtaposition of lead and zinc would, with the assistance of the rain (probably accidulated in its fall through an impure atmosphere), set up a galvanic action, which in time would utterly destroy the lead, as well as the zinc.

4. *Give sketch-figured plans and sections of:—Firstly, cast iron column 10ft. long, to carry 40 tons; secondly, brick pier 10ft. high, to carry the same amount; thirdly, I steel girder, 18ft. span, to carry 12 tons, centre load and distributed load respectively. Give the working out of the same.*

Cast iron column:—A column sixteen diameters high will carry 2 tons per square inch safe load. Therefore, assume diameter at 10ft. ÷ 16, say $7\frac{1}{2}$in., metal required = 20 sq. in. Assume thickness of column at 1in., therefore mean circumference = $6\frac{1}{2}$in. Area of metal = $6\frac{1}{2}$in. × $3\frac{1}{7}$in. (ratio of diameter to circumference of circle) = $20\frac{1}{2}$ sq. in. of metal in column. Brick pier:—Safe load on stock brickwork = 4 tons per square foot. Therefore, 10 sq. ft. of brickwork are required. Therefore, a pier four and a half bricks square will suffice, as it contains about $11\frac{1}{2}$sq. ft. Steel girder:—Stress due to fixed load:

$$S = \frac{W \times l}{4 \times d} \quad \text{(Assume } d \text{ at 1ft. 6in.)}$$

$$= \frac{12 \times 18}{4 \times 1\frac{1}{2}} = 36 \text{ tons stress due to fixed load.}$$

Stress due to distributed load:

$$S = \frac{W \times l}{8 \times d}$$

$$= \frac{12 \times 18}{8 \times 1\frac{1}{2}} = 18 \text{ tons stress due to distributed load.}$$

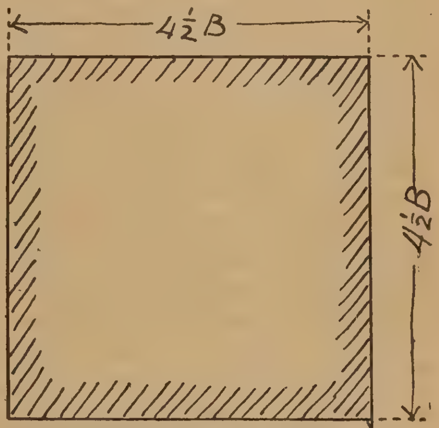
Total stress = 54 tons. At 6 tons (safe load) per square inch = 9 sq. in. sectional area.

VOLUNTARY QUESTIONS.—*A building is required as nearly as possible fireproof. What materials would you use in the same for:—Firstly, casing girders and stanchions; secondly, for floors; thirdly, for the walls; fourthly, for the roof?*

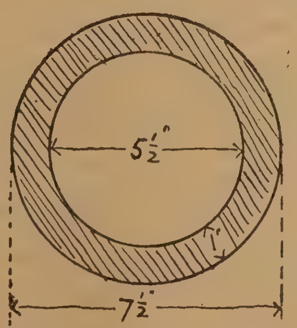
For girders and stanchions: "Salamander" (asbestos) fireproof decoration, or fibrous plaster. For floors: Concrete and steel construction, Homan and Rogers, or other fireproof floors. For walls: Brickwork or stonework, or both combined. For the roof: Steel construction and slating, or a flat concrete roof with asphalte.

A cellar is to be built near a river, and below high-water mark. What will you specify to keep the interior dry?

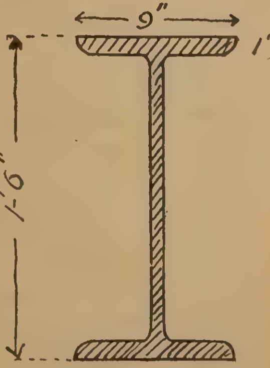
A Val de Travers asphalte, damp-proof course 6in. above the ground line; this asphalte to be continued vertically down against the outside of the walls to the level of the (concrete) cellar floor. At this point the damp-proof course would be carried horizontally



BRICK PIER



CAST IRON COLUMN



STEEL JOIST.

See other opinions on inset in this number.

through the wall to the inside of the building, and continued over the whole cellar floor.

State three kinds of materials you would use as a damp course, and which of the three you prefer.

Two courses of slate in mortar and breaking joint; Callender's bituminous damp-proof course; ½in. layer of asphalte. The latter preferred.

Views and Reviews.

THE SUNNY SOUTH.*

THIS book appears to be intended as a guide for the snap-shottist, though it contains many descriptions which are also of general interest. It is illustrated with about fifty photographs taken by the author, and a few illustrations from other sources, most of which are only of moderate merit. The half-tone block at the best is not so satisfactory for book illustration as a line drawing, being out of keeping with the type and necessitating an over-smooth paper, and, except when at the best, is very unpleasing, though one has to get used to it nowadays, when photography is the basis of most of the illustrations both of journals and magazines. In this case the block maker is no doubt, partly to blame, but the point of view has been frequently chosen too hastily, and allowance has not always been made for the great difference in strength of lighting between the upper aud lower parts of a subject when the plates were being developed—a thing which has often been the cause of vexation with plates exposed in Southern countries, where it is difficult to gauge the amount of light. (See "The Devil's Bridge, Martorell," on p. 46, for an example of the first defect, and "The Miguelete, Valencia," on p. 59, of the latter.) The former subject composes very finely from the river bed a little farther down, which one would never suppose from its awkward appearance as given. The most satisfactory illustrations are "The Cloister, St. Pedro, Gerona," p. 25; "Cyclopean Gate, Tarragona," p. 49; "The Roman Bridge at Mérida," p. 107; "Fountain at Lugo," p. 179; "Reja of the Coro, Palencia Cathedral," p. 183; and "The Retablo of St. Nicolas, Burgos," p. 195. Most of the others show either distortion or insufficient definition, though it is only right to remember that a photograph successfully made for purposes of reproduction is rarely pleasant to the artistic eye and *vice versâ*.

The authoress appears to have generally paid but hurried visits to the places she describes, and many are the small errors into which she falls. Two or three examples will suffice. She visits Montserrat, ascending the mountain by rail. Near the station she has a glimpse of the "riding path," of which she says: "It was a place where I would not trust myself on any manner of beast." What it was she saw one scarcely knows; but the "riding path" to the Monastery of Montserrat is a fine road, well graded, and broad enough everywhere for two carriages to pass each other. And at Tarragona she says: "The only entrance to the Cloisters is from the Cathedral." As the canons live above the Cloisters this is scarcely likely to be the case; and the writer remembers leaving them by a gateway at right angles to the entrance from the Cathedral and some little distance from it, a few years ago. At Murcia she saw an "industry peculiar to Murcia." This was the manufacture of thread for making nets from the bodies of silk worms. "When these are old and of no further use for producing silk" (Mrs. Main evidently has never kept silkworms) "they are placed in vinegar for twenty-four hours. Afterwards numbers of girls from the surrounding country are employed in pulling them out into fine and almost unbreakable thread," which is exported to England and other countries. At Léon the authoress was moved to express her opinion of the west front of the Cathedral, and on p. 160 suggests means for improving its design, though on p. 126 she has acknowledged that she knows "not much about architecture," so that it almost appears as if the book has been written without due consideration, or had been insufficiently revised.

In two of the latter chapters she justifies her remark in the preface that the book was written as a supplement to the guide books. At Zaragoza she refers to the crossed swords at the entrance to the Capilla Mayor of La Seo, which a Sacristan told her were the four swords with which Pedro Arbues de Epila, the ferocious inquisitor, afterwards canonised, was quartered in 1485 on the steps of the cimborio. (She does not refer to the quaint costume of the Sacristan, by the bye, who wears a ruff and a curious sort of hat, besides his flowing gown, when on duty.) And at Manresa she discovered a chapel in which was a marble figure of St. Ignatius Loyola, clothed in his own robe and girdle, and lying on its side on a sheet of glass, commemorating the eight days' trance, during which (as an inscription states) his spirit rose to Heaven, and had revealed to it the plan for the foundation of the Jesuit Order.

Have you seen ❀ ❀
The Furnisher yet?

The OCTOBER PART (No. I) of the "Journal of Eight Trades" is receiving the highest praise from all quarters and is universally admitted to be

AN EXCELLENT PRODUCTION.

There are articles on The Furnishing and Decorations at the Carlton Hotel, Metal Work as Applied to Furniture, Notes on Woodwork Construction, Royal Furniture, The Gold and Silver Plate of the Mercers' Company, etc., etc., and the copious notes are new, bright, and exceedingly attractive.

SPECIAL CORRESPONDENTS

in different parts of the kingdom supply exclusive information of great value to everyone in any way connected with the Furnishing and Allied Trades.

In addition to the numerous excellent illustrations there are two sets of

WORKING DRAWINGS

on separate sheets, and, what is most important,

THE PRINTING IS UNEXCEPTIONABLE.

All these features, therefore, make The Furnisher an invaluable companion for all interested in the furnishing trades.

Order immediately from your newsagent or direct from the Publishers at

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND, W.C.

Correspondence.

BRITISH PLASTERWORK.

To the Editor of THE BUILDERS' JOURNAL.

BANBURY.

SIR,—I notice in your issue for last week that there is an illustration titled "External 'Pargetry,' Burford, Oxfordshire." This is a mistake; it should be Banbury, not Burford. Banbury has several most interesting pieces of pargetry-work, and amongst others a ceiling at The Reindeer Inn, moulds of which have lately been taken for reproducing it in the English rooms at the Paris Exhibition.—Yours truly,

W. S. ORCHARD.

[We are obliged to Mr. Orchard, and also to another correspondent, for pointing out this error.—ED. B. J.]

THE USES AND LIMITS OF PERSPECTIVE.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.C.

SIR,—A friend of mine has sent me the following note:—

"The BUILDERS' JOURNAL has a criticism of your leaderette on 'Uses and Limits of Perspective' by Henzell Ascroft; I don't know if you have seen it. He loses sight of your argument and upholds the use of a (gaudy?) perspective in order to catch clients. Then competition perspectives he upholds, assuming practically that the design selected is chosen on account of its perspective—which is grossly unfair. Later on he speaks of 'artistic merit.' Does this touch the subject under consideration, namely, *use*? 'Impossible points of view.' Often the building illustrated is in a narrow street, say, 30ft., and the point of view would perhaps have to be 60ft. away in order to avoid sharp perspective. This means the point of view being in the back yard of the opposite house. Isn't this an 'impossible point of view?'"

For my own part, I do not see that Mr. Ashcroft has done more than misunderstand me. My opinion was expressed clearly, as I thought, but men who write strongly are always open to misunderstanding of this sort.

G. A. T. M.

THE TREATMENT OF ARTICLED PUPILS.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, S.W.

SIR,—Believing that the subject of the treatment of their pupils by practising architects is one which is ripe for discussion, may I crave space for a letter which is intended rather to draw expressions of opinion from others, both principals and pupils, than to expound the writer's own view. It is a question with many sides to it. There are many principals who are content with moderate premiums and who then deal honestly with their pupils, not only giving them opportunities for becoming draughtsmen, but teaching them to the best of their ability the rudiments, at least, of all the many branches of their calling. There are also principals who demand large premiums and then allow their pupils to waste their time while grumbling at them as nuisances. On the other hand, there are pupils who use the opportunities given them to the best advantage, and, proving themselves trustworthy, are more and more trusted; and there are those who prefer to enjoy themselves, and, learning little in consequence, complain that they have not been properly taught. These things seem to be inevitable; but which is more usually at fault—master or pupil? What are the proper remedies? Is the system of pupilage a failure, and, if so, what would be preferable? If it falls short of the necessities of modern times, how can the shortcomings be supplied? These are important questions, sir, which only the opinions and the experiences of many, freely expressed, can tend to solve.—Yours faithfully,

PRINCIPAL.

ARCHITECTURAL ASSOCIATION.

CIRCULAR STAIRS AND SPIRAL VAULTS.

A MEETING of the Architectural Association was held on Friday evening last at 9, Conduit Street, W., when there was a good attendance. Mr. G. H. Fellowes Prynne was in the chair. The minutes of the opening sessional meeting held on October 6th were read by the secretary and confirmed. The following gentlemen were elected members of the association:—Messrs. A. J. P. Carrington, H. C. Quérée, N. O. Searle, D. Anderson, R. B. Rowell, H. Greenby, H. R. G. S. Smallman, R. H. Dods, D. Hayworth, C. M. Crickman, W. Jackson, F. L. Atwell, R. F. Bacon, C. V. Bisley, L. F. Buckingham, S. Burgoine, W. E. V. Crompton, A. Dicken, C. P. Fleetwood, J. E. Forbes, N. Innes, L. Kaberry, C. C. Makins, F. M. Miles, G. Morland, R. H. Stone, H. F. Tasker, C. J. Thompson, A. W. Tippetts, B. D. Tracy, R. J. Tyndall, F. W. Williams, and J. MacLaren Ross. After a list of nominations had been read, the chairman formally renominated Messrs. Hart and Satchell as members of the committee. These gentlemen will be re-elected at the next ordinary general meeting. A vote of thanks, proposed by Mr. G. B. Carvill, to those who had assisted at the conversazione on October 20th, was carried by acclamation. On the proposition of the president, votes of thanks were accorded to the hon. secretaries for their labour in arranging the conversazione. The president announced that Mr. A. Wallace Rimington had kindly offered to admit members of the association free to the exhibition at the Fine Art Society's galleries in New Bond Street, W., upon presentation of members' passes for the current session. The exhibition opens on November 6th. Mr. Lawrence Harvey's paper on "Circular Stairs and Spiral Vaults" was then read by Mr. W. H. Johnson, technical instructor in masonry, as follows:—

The Paper.

The invention of circular stairs winding round a solid newel is, I believe, mediæval. I cannot say to a certainty when the first winding staircase was built; but, as far as I know, there are no precedents in either Greek or Roman architecture for that constructional feature. To my mind, the invention of the winding stair arose out of the requirements of military architecture. What was aimed at in the design of castles and fortified places was, amongst other things, compactness; for, given a certain number of men as garrison, the defence will be strong in inverse ratio to the extent of the wall to be defended. Hence followeth that all spaces that are not required as dwellings or stores should be reduced to a minimum. Amongst these spaces are the staircases. In the designing of stairs in a fortress a point of great importance is that the stairs be easily defended. All these advantages were secured by circular stairs round a solid newel. These stairs take the least room on plan. They are easily defended by one brave man against any odds, as only one assailant at a time can come to the front, and that assailant is placed unfavourably for either attack or defence, and cannot receive any support by bow and arrow or musketry from men placed behind him, as would be the case in a straight flight of stairs. It is always a matter of surprise for me to find with what directness

Mediæval Architects

found readily the best solution for the constructional problems of their time, a directness and a happiness which we only find to-day in the work of our mechanical engineers. I do not think that mediæval architects were men better gifted than ourselves, but I consider they were particularly happy in not being encumbered by architectural traditions, and in having begun their architectural career as simple workmen, either as carpenters or as stonemasons. Free from our preoccupations of re-editing certain past styles of architecture, mediæval architects saw only the constructional problems they had to deal with, and the constructional means they possessed for solving these problems. Moreover, as carpentry and masonry require certain

Geometrical Operations,

they developed in time a great power of design, combined with an equally great power of working materials into all kinds of ingenious combinations. Our modern architectural students are, I am afraid, at quite the opposite pole of the training which gave mediæval architects their unsurpassed cleverness. They are called upon to carry an enormous load of traditional architectural forms, and a minimum, not to say no, practical or geometrical knowledge whatever. As a specimen of the modern way of treating architecture, I remember a design of a law court I made in my first year of pupilage at the École des Beaux Arts. I was asked to design it in Doric Greek. How I tortured halls, chambers, and private rooms, to bring them within the frame of a Greek temple nobody can tell who has not tried his hand at a similar task. The result was not unpleasant nor even practically absurd; but I very much question whether this kind of designing is a healthy exercise for either student or even mature architect. There is less harm in re-editing Gothic architecture of any given period because this architecture is nearer to us, suits our climate, sometimes our requirements. But even then mere re-editing cannot but impoverish both reasoning powers and imagination, and I should prefer the

Mediæval Way of Becoming an Architect

—that is, obtaining through workshop practice a thorough knowledge of all the means of solving constructional problems, and through lessons given in small classes the geometrical knowledge necessary for dealing with all the forms one may require in building. This done, I should advise to go about one's work in the same spirit and way as mediæval architects—that is, design what suits best the purpose the buildings have to serve, according to the constructional means at our disposal. Geneva is particularly rich in circular staircases. Up to the end of the last century none but such staircases were used even in the noblest mansions, for Geneva was a fortified town surrounded by powerful enemies, and hence space was most valuable. These stairs are called des "Virets," a local denomination which comes from an old French verb "virer" to turn round. Amongst the oldest are, no doubt, those which lead up to the towers of the cathedral. They were built probably in the beginning of the twelfth century. Their radius is about 3ft. 8in., the newel has a diameter of about 8in., so they leave a clear space of about 3ft. 4in., which allows a person going down and one going up crossing one another on the stairs. The steps are not all of equal height. In the lower part, measured in the middle, the steps have a rise of 8in. and a tread of about 11in. There are sixteen steps to one wind, which gives an ascent of about 10ft. 8in. for one convolution. I have noticed that the back of the step as well as the riser go to the centre of

The Newel,

an arrangement which leaves very little stone where the step abuts against the newel, and one that should be discarded. In later work the back of the step is made tangent to the newel, whereas the front part still runs to the centre of the newel. In an old castle I have seen some days ago, I noticed that the back of the steps had been finished off with a chamfer, thus making an approach to a continuous ceiling as soffit of the staircase. To make a continuous soffit to a circular staircase requires a rather developed knowledge of geometrical construction so as to provide a joint which in all its parts shall form a square angle with the soffit of the step. The geometrical constructions required for

Setting Out such a Staircase

are fully explained in the number of July 31st, 1891, of the "Building News," and models of the structure have been made by my pupils in the Guilds' Institute. I may only say that once the lines have been put on, the steps are worked very easily, and have a most satisfactory effect. It is to be observed that as each step is housed in the wall, and at the other end forms part of the newel, it is desirable that the wall and the newel should bear the same weight, otherwise the steps submitted to unequal pressures would break. The newel, if not the steps, should rise, therefore, to the same height as the wall. A very good arrangement is to finish the upper part of the staircase with a fan vault resting on the newel.

Fixing New Steps.

In course of time steps are worn out, and in circular stairs new steps are very difficult to fix. To meet this difficulty, it is far better to lay the steps on the extrados of vaulted ceilings, which follow the rake of the stairs. This led to the invention of the spiral vault, called Vis St. Gilles, the construction of which is given in the number of August 21st, 1891, of the "Building News," and of which a model was made from my drawing. The voussoirs of this vault are worked on the same principle as winding handrails. As all the voussoirs of one course are identical, it is a very easy vault to construct with concrete blocks. It requires only the working of as many blocks as there are courses, and casting all the others from these models.

In a Spiral Vault the Newel is Useless,

and the vault would hold quite as well round an open well hole. In that case the vault would look better by having as section either a quarter of a circle or a quarter of an ellipse. I think it is much to be regretted that the geometrical stairs in the south tower of St. Paul's are not supported by such a vault instead of resting merely on the edges of the steps. In the Town Hall of Geneva there is an inclined road that rises to the top of the building round a square well-hole, and which rests on Gothic groins. The spiral vault may be intersected with raking arches to correspond with arches in the outer wall. This is a problem which my pupils have not attempted, but the elements of which they will find in the construction of the groining of an annular vault given in the number of August 23rd, 1889, of the "Building News." I am quite aware that the explanations I have given in this short paper are quite insufficient for helping those who have not studied

Stereotomy

in constructing even the simplest spiral vault, let alone all the beautiful combinations which can be designed. But I hope the members of the Architectural Association will find in what I have said an incentive to form practical classes for the study of descriptive geometry and stereotomy. If so I shall be glad of having written these few lines, as I firmly believe the studies I have spoken of above will have a most favourable influence on the future of English architecture.

Having read Mr. Harvey's paper, Mr. Johnson proceeded to give an explanation of the methods of constructing spiral staircases, referring to diagrams and models on exhibition at the meeting.

THE DISCUSSION.

In opening the discussion Mr. A. Bolton said he did not think the old Gothic architects set out their vaults in a scientific way, as seemed suggested by Mr. Harvey's paper; to his mind a great deal of the charm of old Gothic work was in the irregularities. Though the methods of the modern French school were certainly scientific and clever, their work was not over beautiful, and was not generally admired by architectural students. He thought the methods advocated by Mr. Harvey had to be proved to be an improvement over the old methods.

Mr. G. H. Jones was not prepared to contest the challenge put forward by Mr. Bolton, but said he felt sure that Mr. Harvey's system was one that gave good practical results. It did not always follow that an arch was the best thing to build over a void; after all it was only a lintel bent. The lintel was introduced first and the arch followed, and in some cases it was better to use a lintel than an arch. He referred to the case of the castle at Carthew in Cornwall, where a turret had sunk nearly 7ft. and swung round 2ft., but notwithstanding, there was not a crack in the masonry; and this was entirely due to the lintels holding the tower together. It therefore did not follow that a circular arch was the best form of arch for the head of a window, or anything else. The strongest kind of arch was perhaps a segmental one having a rise of about one third the span. A thorough and practical knowledge of the principles of masonry he considered to be invaluable to an architect.

Mr. G. Goodley said that Mr. Harvey had always taught that the work should be done square and featheredge avoided.

The chairman said he was bound to acknowledge Mr. Lawrence Harvey's warm enthusiasm in his work; this was always a great factor; it had carried weight in Switzerland, and must do so in England. He thought that the contention that all old theories should be discarded for newer ones was worthy of some consideration, yet we could not do better than study the architectural and constructional traditions of the past. He was glad to welcome members of the College of Masons at the meeting that night, for architects should not forget that when setting-up groins, for instance, they must make their designs capable of being worked from, and therefore the more they got in touch with geometrical theories the better; the study must be immensely useful and at the same time interesting. Very often the mason was called upon to work out the problems of some of the details which had only been indicated by the draughtsman. It was a pity that, in England, we did not take up the science of masonry as they did in some of the smaller states like Switzerland, where Mr. Lawrence Harvey now was, and he considered there was great need for Governmental help in promoting study. He hoped that by degrees there would be a large college of masons in England, as it would improve the architects' profession.

A vote of thanks to Mr. Harvey for his paper was then carried unanimously, and to Mr. Johnson for reading the paper and giving his lecture. Mr. Johnson briefly replied, and the meeting then terminated.

The next ordinary general meeting of the Association will take place on November 10th, when Mr. W. Brindley will read a paper on "Marble."

Italy exported last year 21,000 ancient and modern works of art, valued at 600,000dols. More than one-half of them went to Germany.

The Employees of Mr. John P. White, of Bedford, who makes a speciality of wood chimneypieces, held a dinner recently, when Mr. White presided.

The Church of Allhallows, Barking-by-the-Tower, has been undergoing restoration during the last seven years, according to the designs of the late Mr. Pearson, R.A. About £8,000 has been expended upon the fabric, but in order to finish the work another £2,500 is required.

Roman Relics at Chester.—During the alteration of some premises in Eastgate Street, Chester, a quantity of Roman lead piping containing an inscription was discovered. The inscription shows that the pipes were laid when Vespasian and Titus were Consuls for the eighth and ninth times respectively, and when Cnæus Julius Agricola governed the province of Britain.

The Durham College of Science, Newcastle-upon-Tyne, have just forwarded us their calendar for the session 1899-1900. The classes connected with this institution in Art, Building Construction, Plumbing and Engineering are all that can be desired, and have in connection with them a staff of well-known instructors. Mr. John Parnell Allen, P.A.S.I., is the lecturer in the Building Construction class, which is arranged with a view to preparation for the constructional sections of the examinations conducted by the Royal Institute of British Architects and the Surveyors' Institution; it also covers the syllabus of the Science and Art Department in this subject.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

SAWING PENNANT STONE.

To the Editor of THE BUILDERS' JOURNAL.

SWANSEA.

SIR,—Will you kindly let me know the best material for sawing by steam Pennant stone blocks about 7ft. square.—Yours faithfully,

D. H.

The most satisfactory material for sawing blue pennant stone is chilled shot, to be obtained from J. E. Matthewson, Bellefield Works, Sheffield. This is used in place of ordinary sawing sand, but in much smaller quantities.

F.

MARBLE MONUMENTAL WORK.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—Please give the address of a firm that supplies monumental work in marble, ready for the trade; I have been given to understand that large quantities come prepared from abroad.—Yours truly,

CHISELLER.

The names and addresses of many firms who supply finished marble monumental work are given in the Post Office directory. Probably S. A. MacFarlane, Limited, 149, Bishopsgate Street Without, E.C., would suit you.

WHAT TO CHARGE.

To the Editor of THE BUILDERS' JOURNAL.

NORTHAMPTON.

SIR,—What should I charge a speculating builder who wishes me to make plans for four cottages for the local authorities' approval? Should I charge by the time engaged on same, or is there a generally recognised fee for this sort of thing? I may say that the builder will not require me to do anything further than the above mentioned item.

Z.

It would be best to make an arrangement at so much per cottage before undertaking the work, which is hardly of a class that architects of any standing care to have much to do with.

G. A. T. M.

SELLING OF GROUND RENTS.

To the Editor of THE BUILDERS' JOURNAL.

HARRINGAY, N.

SIR,—Will you kindly inform me through the BUILDERS' JOURNAL if it is lawful for an architect and surveyor to occasionally sell ground rents, houses, and land and receive a commission; or is it necessary for him to have a licence for so doing?—Yours faithfully,

A. W.

I am not aware that a licence is necessary for the purpose of enabling a person to effect a private sale of land, &c., on commission. Of course, if a man acts as *auctioneer,* he must have an auctioneer's licence, and if he acts as a *valuer,* he may bring himself within the 40 G. iii., c. 43 (Eng.), 5 and 6, V. C. 82 (Ireland).

H. P. B.

FIRE ENGINE STATION.

To the Editor of THE BUILDERS' JOURNAL.

NORTHAMPTON.

SIR,—I shall be greatly obliged if you will tell me the best method of drying the hose pipes of fire engines. I propose erecting a tower to do this, with iron wall ladder inside and a gallery near top; walls to have louvre openings at intervals. What is the best position for a fire bell? As the station is a small one, I propose building a small turret on top of the suggested tower to contain the fire bell, and thus be enabled to make a good architectural feature. Are the above suggestions practical?—Yours, &c.,

B. A.

Both the suggestions are perfectly practical and practicable. We would only add that a hot water radiator at the foot of the turret would conduce to the rapid drying of the hose pipes.

G. A. T. M.

BOOKS ON BUILDING CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

PLYMOUTH.

SIR,—What would be the best books for Building Construction Honours, Part II.; also for the final examination in design.—Yours sincerely,

G. C.

Building Construction Honours, Part II., consists largely of design. For working details Rivington's I. and II. will be useful, but a knowledge of design can only be obtained by practice and a careful analysis of the works of our leading architects, coupled with genuine criticism of your own efforts by some capable man.

R. W. C.

HIRING STEAM ROLLERS.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.C.

SIR,—Would you kindly let me know whether there are any firms who rent out steam road rollers. If so, at what rate? I should also like to know what would be the usual salary of the engineman in charge of such a roller and the consumption of fuel per hour.—Yours truly,

ENQUIRER.

There are several firms in various parts of the country who let out steam rollers on hire, and the names and addresses of some can usually be found on reference to "Results of Tenders" in the "Contract Journal." (Weekly, 6d. 139 and 140, Salisbury-court, E.C.) The rate is usually from about 3s. per hour, upwards, including the man's time and the cost of fuel. An engineman's wages would be £2 per week, or more, and the consumption of fuel would be rather more than half a cwt. per hour—say at a cost of 6d. per hour, for coke at 17s. per ton. About 200 square yards of metalled roadway can be rolled down in an hour.

G. H. B.

LANDLORD'S LIABILITIES.

To the Editor of THE BUILDERS' JOURNAL.

LLANGOLLEN.

SIR,—Will you please give replies to the following questions:—(1) Can you refer to any case or cases in which a landlord has been held liable by tenant for damages, from any disease resulting from the insanitary or defective condition of his property? (2) Can an action at law be maintained on those grounds by a tenant of an unfurnished house of any rental above £8; (3) an unfurnished house, if the rent is £8 or under; (4) a furnished house of any rental, £8 or under, or £8 and above? (5) What is the tenant's remedy? (6) What is the landlord's remedy? (7) What is the landlord's protection? (8) Can a legal instrument or agreement be executed which will relieve landlord of any or all of the liabilities mentioned, if any.—Yours, &c.

LLANGOLLEN.

(1) No. But in *Walker* v. *Hobbs* (1889), 23 Q. B. Div. 458, a tenant was held entitled under the "Housing of the Working Classes Act 1885," Sect. 12, which is in the same terms as the "Housing of the Working Classes Act 1890," Sect. 75, to maintain an action against the landlord for injuries sustained by reason of the falling of plaster from the ceiling. (2) Yes, in the Metropolis £20, Liverpool £13, Manchester or Birmingham £10. (3) Yes, I think so, on the principle of *Walker* v. *Hobbs,* referred to above. (4) Yes. On the letting of a furnished house at any rent there is an implied term that it shall be reasonably fit for human habitation. (5) The tenant can quit, pay no rent, and can bring action for damages. (6) For what? (7) Against what? (8) Yes.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"O toiling hands of mortals! O unwearied feet, travelling ye know not whither! Soon, soon, it seems to you, you must come forth on some conspicuous hilltop, and but a little way further, against the setting sun, descry the spires of Eldorado. Little do ye know your own blessedness; for to travel hopefully is a better thing than to arrive, and the true success is to labour."—R. L. STEVENSON.

The New "Architectural Review." AT the present moment special interest attaches to any details concerning the work of a war correspondent, and probably the page of this month's "Architectural Review," to which many readers will first turn, will be that which contains an excellent portrait and a sympathetically written "Appreciation" of the late William Simpson, R.I. Mr. Simpson's was a varied and in some ways a remarkable career. He was a man of many parts, and an example of his artistic skill is given as a frontispiece—reproduced in colours—to this month's Review. Another interesting feature of the November number is an article on "Percy's House and the Gunpowder Plot," by Mr. J. Brownbill, M.A., in which some interesting particulars are given with respect to the house adjoining the Houses of Parliament, which was the headquarters of Guy Fawkes and his fellow conspirators. A well illustrated article on "Scottish Gardens," written by Mr. R. S. Lorimer, will prove attractive to all interested in horticulture or garden planning.

The Westminster Scheme. THE much talked of Westminster Improvement Scheme has now been adopted by the London County Council. It will be remembered that the proposal was taken up by a syndicate in 1898, but Parliament rejected their Bill on the ground that such a scheme should be carried out by public authority and not by speculators. The Council then took the matter in hand, and decided on July 4th last to apply for power to carry out the work. Two conditions were imposed. First, the Government were to undertake the widening of Abingdon Street, and, second, the Vestry of St. Margaret and St. John was to contribute £100,000. The Government have promised to do their part, and the vestry has done its best to secure the co-operation of the new municipality of Greater Westminster, which does not come into existence until November, 1900. Briefly stated, the scheme, in its latest form, consists in embanking the Thames from Victoria Tower Garden to Lambeth Bridge, widening Millbank Street by 70ft. or 80ft., buying up and clearing a large district of dilapidated and insanitary property, and making a new and dignified approach to Lambeth Bridge. At the same time the Council will acquire a large amount of land that will be let on building leases of eighty years, and an opportunity is also provided for housing on the adjoining Millbank site the population displaced by the projected improvements. Lambeth Bridge badly needs rebuilding—in fact it has been condemned as unsafe—and this could not be done properly without improving its approaches and altering the gradients to suit the new structure. The Westminster scheme is therefore a very timely one, as anyone can satisfy himself by taking a walk from the Houses of Parliament to the Tate Gallery. Of course what specially appeals to everyone—especially to Londoners—is that when the work is completed the embankment will be continuous from Blackfriars to Chelsea. With the steady and colossal growth of the Metropolis, and the consequent alterations, extensions, and improvements, one wonders what will be the extent of the embankment (or embankments) fifty years hence. Westminster itself is practically a new city, for at the beginning of the century it was three-fourths slum, while now it is the place of great buildings.

City and Guilds Institute. THE great cause of technical education has had no more zealous champion than the City and Guilds of London Institute, which now exerts a strong influence over the whole country. As the Duke of Devonshire (the Lord President of the Council) said on the occasion of the opening of the exhibition of students' work last June, the gentlemen who founded the Institute were the pioneers in the great work which was afterwards taken up by the Government, by Parliament, by the County Councils and County Borough Councils, and by other authorities throughout the kingdom. The Institute has been working in connection with the Science and Art Department for twenty years, and its object is to familiarise the student with all the processes and all the details which he will require to use in the trade he is going to undertake, and to show him how the knowledge he has acquired at lectures or in books may be applied to the practical performance of his business. During the past session of 1898-99 the total number of students in the classes registered by the Institute was 36,155, as compared with 34,990 in the previous session, and the number of candidates examined was 14,978, as compared with 14,148. The relations now existing between the Institute and the technical instruction committees, the various trade organisations, and the Association of Organising Secretaries are most satisfactory, a state of things highly beneficial to the spread of technical education on a sound basis. It is interesting to note that Manchester and Salford taken together, with a population of 754,781, have 2,648 students attending the technical classes, while London, with its population of about four millions and a half, has only 5,735. New regulations have been introduced into the Institute's programme, and in accordance with these no person can be registered as fully certificated in any trade subject who does not pass the practical test that forms part of the examination, and candidates for a certificate in Plumbers' Work must pass the written and practical examinations in either grade in the same year. A course of instruction in Builders' Quantities has been added to the syllabus and will be useful to quantity surveyors and builders and builders' foremen—the Skinners' Company offer a prize of £11 in this subject. A new syllabus has also been prepared for a two years' course in the ordinary grade of mechanical engineering. Copies of the programme of technological examinations for 1899-1900 may be obtained from any bookseller (price 10d. net), or from the publishers, Messrs. Whittaker and Co., Paternoster Square, E.C. (postage 4d. extra). The programme is not sold at the offices of the Institute.

"B(u)y Killarney's Lakes." AFTER all the poetry that has been made about the famous lakes of Killarney, it is very galling—to the poet or artist—that its name should be mixed up with that of an American syndicate who wish to "develop" the lakes. The syndicate recently wrote to notify the Earl of Kenmare that there was last season insufficient boating accommodation for tourists, and that, as part of the plan to cater largely for the tourist traffic during next summer, they proposed to place on the lakes a number of electric gondolas, for which they requested anchorage and landing accommodation at the various points of the lake controlled by his lordship. In reply, the good earl refused countenance to the proposed electric gondolas, which he said were not needed for tourists, and would certainly injure the local boatmen. His letter concluded: "The lakes, being comparatively small, are quite unsuited to electric launches rushing about, even under the euphonious name of 'gondolas.' They certainly would not lend enchantment to the scene." A meeting of the joint English and Irish Committee, appointed at the annual general meeting of the National Trust to consider the question of the Lakes of Killarney, was held recently in London, when the impending sale by auction was discussed. At the conclusion of proceedings it was decided to establish branches of the Trust in Scotland and Ireland. The lakes will be offered for sale on November 28th next, but it is to be hoped that the purchaser—if there is one—will be someone who has sufficient respect for beauty not to ruin this lovely spot for commercial or speculative ends.

Bottles for Decoration. IN the year of the outbreak of the Russo-Turkish war, there was built on the main road to Missenden, in Mid Bucks, an interesting hostelry known as the Royal Oak. It seems, however, that the builders had become so interested in the war that they thought some permanent record of it ought to be made. And so on the gable end of the house there is a singular representation, the origin of which the majority of visitors know nothing about. It consists of full-size figures of a Russian and a Turk, formed entirely of port wine bottles inserted in the flint-and-brickwork peculiar to Buckinghamshire architecture. Only the bottom of the bottles are exposed. It seems rather a silly thing to waste time and bottles in this manner—but there it is.

The Architectural Bishop. THE Bishop of London wanted some alterations to be done to the palace at Fulham, and employed a first-rate architect to inspect the building, and to consult as to what was needed to be done. The business occupied the latter three or four hours (careful man), and the bishop, on the report of the expenses, determined not to proceed. He said, however, "Be good enough to tell me for how much I shall draw a cheque on account of the trouble you have taken." "I thank your lordship—a hundred guineas." "A hundred guineas!" "Yes, my lord." "Why, many of my curates do not receive so much for a whole year's services." "Very true, my lord; but I am a bishop in my profession." The cheque was paid over in silence. This is a good story, but we seem to have read something like it before.

Leper Windows. THE leper window bogie has been a long time dying, and even now there are some who believe that the purpose of these windows was to allow lepers to see what was going on inside the church. Two churches in the East Riding—Goodmanham and Holme-on-Spalding-Moor—have recently called attention to this matter. In both there are low side windows, and in both they are so shaped that nobody outside them could see the high altar within. Mr. St. John Hope has shown that their real use was to allow the Sanctus bell to be rung outside. If the village was on one side of the church only there was only one window, and that towards the village. If the village lay on both sides of the church, as at Holme, there was a window on each side of the church. It is quite true that there were lepers in England, as the existence of lazar-houses proves, but that they were so numerous as to necessitate provision for their worship in every parish is not borne out by facts.

The Architectural Umbrella. LAST April we gave some particulars of the latest development of the Eiffel Tower and Big Wheel idea, namely, the great umbrella that was proposed to be erected at the forthcoming Paris Exhibition. The structure was to be 300ft. high, supported on an iron frame, covered with multi-tinted glass, and to have restaurants, galleries, &c., fixed at different heights on its stem. We now have great pleasure in announcing that the Exhibition authorities have decided that the idea was an absurd and impracticable one, and it has, therefore, collapsed. There are already far too many architectural abortions, and there is surely no necessity to make a special effort to add to the unwholesome list. Therefore, *à bas* all those erections, of which the would-be architectural umbrella is a shining example.

Under Discussion.

SOCIETY OF ARCHITECTS.

An extraordinary general meeting of the Society of Architects was held at 7.30 p.m. on Thursday last at St. James' Hall, Piccadilly, W., being followed by the annual general meeting. Mr. T. Walter L. Emden, L.C.C., presided. The minutes were confirmed of the extraordinary general meeting held on September 28th, when resolutions were passed that the annual subscription should be raised from one guinea to two guineas and that the time limit for payment should be reduced from twelve to six months. The minutes of the ordinary general meeting held on July 26th were read and confirmed, and, after ballot, the following new members were elected:—R. A. J. Bidwell, Singapore; F. G. Briggs, Blackburn; W. Campbell, Hanley; R. C. Edwards, London; C. Flint, Buxton; E. J. Hammond, New Brompton; H. Harrison, Newark-on-Trent; W. A. Keates, London; F. W. Richards, Lowestoft; A. Roberts, London; F. Witt, London; H. V. Wolstenholme, Blackburn; and A. W. Yeomans, Chard. The report for the year ending October 31st stated the present membership to be 583, an increase of thirty-six during the year. The Registration of Architects continued to receive the attention of the Society, and a Registration Committee had been formed to forward the proposal. The Council hoped to increase the number of provincial meetings on the registration question. The law relating to "Light and Air" was also receiving attention, and arrangements for the testing of materials were still proceeding. The prompt payment of fees was emphasized. Mr. W. R. Mallett endorsed the proposal to increase the subscription, as for some time past the society had been drawing on its reserve fund. He urged members to support the Society thoroughly. The report was adopted. The following officers for the ensuing year were then elected:—President, T. Walter L. Emden, L.C.C.; vice-presidents, Lieut.-Colonel F. Seymour Leslie, R.E., and Silvanus Trevail, F.R.I.B.A.; hon. secretary, Ellis Marsland; secretary, C. McArthur Butler; hon. corresponding secretary, Edgar Farman; hon. treasurer, H. G. Quartermain; hon. auditor, W. R. Mallett; council, Messrs. J. Bartlett, C. A. Bassett-Smith, G. E. Bond, W. Cooper, J. W. Frazer, W. R. Mallett, G. A. T. Middleton, R. L. Pearce, G. G. Pye, T. R. Richards, R. F. Valance, and J. H. Williams. Votes of thanks were given to the chairman and the secretaries for all the work they had done for the Society, and the meeting then ended.

GOTHIC SCULPTURE IN ITS RELATION TO ARCHITECTURE.

A lecture on this subject was delivered by Professor Baldwin Brown, of Edinburgh University, at the inauguration of the ninth season of lectures on art subjects at the Glasgow Corporation Galleries. He first referred to the meagre display of sculpture in the public buildings of this country as compared with those of France. This, he claimed, was not always the fault of the designer, for many of the Neo-classic buildings with which Scottish towns were so well supplied were intended by their architects to have the adornment of sculpture. There was need for a more general recognition of the principle that decorative sculpture in connection with public buildings was not a mere luxury, but should be, in its beauty and its significance, an integral part of the design. Our comparative indifference to sculpture as an element in architectural effect was of old date, being very observable when we contrasted the exteriors of our native cathedrals and abbey churches with those on the Continent, and especially with the cathedals of Northern France. The interiors of our British churches, however, went far to make up the difference, for we undoubtedly excelled our neighbours both in foliage carving, and especially in the sculptured tomb, with its recumbent effigy, its canopy, and decorative enrichment in carving and colour. The Continent had nothing to show which equalled the beautiful mediæval sculptured figures of the dead, found in such abundance, not only in the cathedrals, but in the simple village churches of our own country. The sculpture was, however, independent of architecture. To observe the two together in their due relations, it was necessary to go abroad, and there were few studies more interesting than to trace out the artistic thoughts that governed the sculpturesque adornment of one of the greater French cathedrals. The sculpture there was not only profusely displayed, but it was in very intimate connection with the fabric, and had grown naturally under the hands of a large body of workmen, all of whom were in a real sense artists. This was proved by the life and animation of the work, its variety, and the wealth in it of rich and tastefully-designed motives. Chartres, Rheims, and Amiens would supply the examples needed for study, and represented at its best the work of the Gothic sculptors of the twelfth and thirteenth centuries.

ART AND RELIGION.

The subject of Sir Wyke Bayliss's presidential address to the Ruskin Society of Birmingham was, "Art an essential element of the National Life." He considered that religion and art were two forces, spiritual and æsthetic, moving in the same plane of human life and action to the same end, the subduing of evil, against the common enemy, the world, the flesh, and the devil. But they moved under different sanctions. In its fight against the world, Art did not look to the promise of another, but to the purifying of this; in its struggle with the flesh, Art strengthened us not by deadening our senses, nor by lifting us above them, but by quickening them to a truer perception; in its conflict with evil or the devil, Art animated us with visions of beauty, of which it or he was the destroyer. If that were true, it would be seen that religion could have no formula to determine what was true in Art, any more than Art could have a formula to determine what was true in religion. Did the curate quite know, in arranging the services, how far he was acting as a priest, and how far as an artist; and did the painter in his studio, dreaming of Art as the regenerator of the world, quite realise that Art had never yet accomplished anything great except under religious inspiration of some kind? In alliance with religion Art found enough to do, for religion was the recognition of a relationship existing between us and God, by which we owed to Him the performance of certain duties, and submission to His will. Did we not submit to that will and perform those duties in a most artistic manner? We were not quite sure whether the sense of reverence which came upon us when we entered a great cathedral was reverence towards the Lord of the Temple, or the Temple itself, or the architect who built it; but, at all events, we were satisfied that the architect must have possessed fine religious feelings. Art could become religious, and still be art, but religion could not be æsthetic, or it ceased to be religion. Religion was the placing of everything in the hand of God, and a surrendering of our will to his, while Art was the taking of everything into our own hands and controlling it according to our own will. That was the difference. Art was an essential element in national life because it stood in close relationship to the great struggle which was always going on between good and evil. In that struggle Art was always taking sides. It took sides with the Greeks against the corruption of sensualism, with the north men against the brutal law of force, with the mediævalists against the cruel inquisition, and it took sides with us now against the still greater corruption and brutality and cruelty of modern commercialism. It came to our aid to-day in our conflict with the world, the flesh, and the devil, with forces greater than of old, or if not greater at least more subtle, and more adapted to our needs. Art was eyes to the blind, strength to those who were weak, gentleness to those who were strong, manhood to the youth, restitution to those who suffered wrong, greeting to those who were absent, faith to those who were doubting, hope to the desponding, charity to all. That was what Art was to us, because it was the greater and we were the less. It was one of the environments of our lives that was daily shaping them to fair or foul issues.

Professional Practice.

Bodmin.—At the County Court on October 25th, S. West, Bodmin, claimed £17 17s. 7d. from W. J. Jenkins, architect and surveyor, Bodmin. It was stated for the plaintiff that in June, 1898, he became the owner of five cottages in Prospect Place, together with a right of drainage at all times through a building site adjoining, owned by R. Roscorla, into the borough sewer, and a right of entry for mending, cleaning, and, if necessary, relaying the drain. In August, 1898, plaintiff agreed with Mr. Roscorla to permit him, at his own cost, to divert the drain, as Mr. Roscorla was about to build on the site. Defendant was employed by plaintiff as surveyor. Contrary to instructions, defendant allowed Mr. Roscorla to relay the drain behind the boundary wall to his property, and at considerable depth below the gradient of the plaintiff's cottages, and in such a position as to be accessible only at very considerable cost. It was also alleged that defendant allowed Mr. Roscorla to form a junction for draining his houses then in course of erection. Plaintiff immediately gave notice that he could not allow the drain to remain in that position, and also that he must repudiate defendant's action. Failing to arrive at a settlement, plaintiff had a drain laid by his own builders at a cost of £8 13s. 9d., which, together with fees, made up the amount claimed. It was contended for the defendant that he had no specific instructions as to the line of direction for the pipes, and was simply called in to superintend the work and see that it was properly done. His Honour Judge Granger said the agreement between plaintiff and Mr. Roscorla was as clear as it could be, and defendant ought to have read it when he had the opportunity. Judgment, with costs, for £9 14s. 9d. and solicitor's costs as taxed by the Registrar.

Dundee.—There is now being erected on a site north of Dighty Water an asylum for imbecile children. Messrs. James Maclaren and Sons, of Dundee, are the architects. The frontage will be 155ft. in length, and in three heights—three storeys in the centre, two storeys adjoining, and only one storey at the extremes. Under the base course the walls will be of bull-faced ashlar, battered on face, while above the walls will all be of square rubble, with angle-scabbled hewn work. The upper storeys will have dormer windows, and the roofs will be pavilioned. A flight of steps lead up to the main entrance, which, together with the three-light bay windows on each side, stands out about 4ft. from the line of wall above, and is surmounted by a parapet wall having moulded coping, the whole length forming a spacious balcony. A vestibule 8ft. wide runs through the depth of the building and connects with a corridor running lengthwise, giving access to the different rooms. Three day rooms, boys' and girls' hospitals, matron's room, Board room, doctor's room, and various sanitary and other offices occupy the ground floor. The floors above are chiefly occupied by bedrooms and dormitories. At the rear of the front building, and only separated from it by a corridor 6ft. wide, will be another large building one storey high. In this section will be a dining hall 71ft. long and 32ft. wide, and also the kitchen, a servants' dining room, several store rooms, baths, a mortuary, and the requisite offices. The boiler house, with a 50ft. chimney stalk, occupies the rear. The entire length from front to back is 180ft. The heating and ventilation will be effected by hot-air flues. On account of the sloping nature of the ground a considerable amount of excavations have been necessary in connection with the buildings at the back, while the ground at the front will require to be partly made up and terraced.

Hove, Brighton.—A first-class residential hotel and self-contained flats are to be erected on the site now occupied by the property known as Mill's Terrace, King's Road, Hove. The King's Road frontage will be occupied by ten shops with flats over, and the parallel side will have a frontage of 277ft. of uninterrupted sea view. The new hotel will be practically ∃ shape on plan, and the entrance will face the lawns, and be entered by a courtyard with a fountain in the centre. Flats will be arranged on the right and left wings, with passenger lifts to all floors, and it is intended that the hotel shall cater for the occupants of the flats, for whom there will also be provided a Turkish bath, an extensive laundry, stables &c. The flats will be arranged in bachelors', family, and grand suites, each of which will have a hot-water supply and goods lift. The hotel can be used separately or in conjunction with the flats, and will be fitted with all the up-to-date appliances in the culinary department, while the decorations and accommodation will be equal to those in any of the hotels in the adjacent borough. Messrs. Palgrave and Co., of Victoria Street, Westminster, S.W., are the architects for the work, which is to be pushed forward with all speed.

Newcastle.—As the result of a statement by Alderman Stephenson in 1891 that an enlargement of the asylum buildings at Coxlodge was absolutely necessary, competitive designs were invited and twenty-two sets were sent in; of these Mr. J. W. Dyson's designs were selected. The undertaking is one of the largest ever carried out by the corporation, and will cost, including everything, about £200,000. The old asylum runs east and west, and the new buildings are an extension of the same line; they are 1,700ft. long and 130ft. deep. The administrative block faces towards the north, and is built roughly in the form of an irregular triangle. At the base of the triangle there is a covered corridor connecting it with the patients' blocks placed behind the administrative block, in what is known in military phraseology as "echelon" formation. That is to say, one block is behind the block in front of it and just overlapping it at the end. Each block has two storeys, and each storey is a ward in itself, so that there are altogether eight wards in the new building, each with its own living and sleeping rooms. Stone is used throughout, and the main front is surmounted by a tower 100ft. high, with a clock in its face. A recreation room is provided 93ft. long, 48ft. wide, and 32ft. high, and has a stage 21ft. by 22ft., surrounded by a decoration in Doulton faience. On the east side of the hall is a glass-roofed corridor. The electric lamps and appliances throughout the building have been strongly protected to prevent patients tampering with them. The wards are ventilated on the Plenum system; in this, the air is drawn down a shaft, and, by means of an electric fan, is driven along a passage beneath the ward, being first taken—if the weather without be cold—over heated coils. Then, rising between the walls, it passes into each of the rooms, ventilating them thoroughly, and passes again into the outer air. The whole of the main corridor and all the cross passages have subways beneath them containing the pipes, wires, &c. An isolation hospital, chapel, mortuary, and engine house are provided in the asylum grounds. Not far from the engine house are covered reservoirs, having a capacity of 50,000 gallons; the towers have tanks holding 36,000 gallons. Details for a large building are always very numerous, and in this case the architects' drawings would cover an acre of ground. Also, 400,000 glazed bricks and 300,000 slates have been used for the building, which was begun about four years ago and is now nearly completed. Mr. Walter Scott was the contractor; Messrs. Fawcett and Co., of Westminster, supplied the fireproof floors; Messrs. W. B. Wilkinson and Co., of Newcastle, formed the concrete fireproof ceilings; and the heating and ventilating arrangements were executed by Messrs. Ashwell and Nesbit, of Leicester.

Warrington.—The Mayor of Warrington laid the foundation stone of the new police buildings on October 24th. These are being erected from the designs of Mr. R. Burns Dick, of Newcastle-on-Tyne, Mr. C. W. Davenport, of Stockton Heath, being the builder. The contract price was £22,000. The site, which was formerly occupied by the old barracks near the Bank Quay station, has an area of about 43,200 superficial feet, and the building will be of pressed bricks with terra-cotta facings; the sanitary arrangements will be thoroughly up-to-date, and the electric light will be installed. There will be two roomy courts, one for the magistrates and the other for the coroner, both on the second floor. The coroner's court faces Wilson Patten Street, and the police-court will be partly over the cells, of which there are twenty. There are special offices for the magistrates' clerk, detectives, juries, &c., and also solicitors' and witnesses' waiting rooms. The magistrates' entrance will be about the centre of the building, in Wilson Patten Street, and the court and police entrance in Arpley Street. Between the cells and Museum Street is a spacious parade room, 100ft. by 50ft., and in Museum Street are also the quarters for the inspectors and sergeants. It is expected that the work will be complete in about two years.

Keystones.

New Technical Schools at Truro were opened on October 24th.

A New Synagogue in Glasgow is proposed to be built on a site in Portland Street.

An Observatory at Lincoln is proposed to be erected in the keep of the old Castle.

The Site for Cardiff's Asylum has been chosen on the Velindra Estate. The purchase price is £206 10s. per acre.

A Rowton House at Manchester has been built in Harrison Street, Ancoats. The architects were Messrs. R. Neill and Sons.

A New Theatre at Rotherhithe has been built from designs by Mr. W. G. R. Sprague at a cost of about £40,000. It seats 3000 people.

A New Hotel near Southwold has been erected from the design of Mr. T. E. Key, of Bloomsbury and Aldeburgh, by Messrs. Kerridge and Shaw, of Cambridge.

Strand Improvement.—The sub-structure of the Hotel Cecil frontage will be completed by the end of this month. The L.C.C. are contributing £30,000 towards widening this part of the Strand.

Value of City Property.—A freehold site at the corner of Fen Court and Fenchurch Street, covering an area of 560ft. super, was sold on October 25th for £10,700, or a little more than £19 per square foot.

A New Electric Lighting Station in Edinburgh has been built in M'Donnald Road from designs by Mr. John Cooper, the borough engineer. Mr. F. A. Newington, the resident electrical engineer, has had charge of the engineers' work on the spot, and the scheme has been designed throughout by Professor Alexander B. W. Kennedy.

Excavation and Other Works at Rome.—On account of the success which has attended the excavations in the Forum, Professor Baccelto, Minister of Public Instruction, has appointed a Commission to consider the advisability of making excavations in the Forums of Trajan, Augustus Cæsar, and Nerva. Work is in progress for the piercing of a tunnel completely under the Quirinal Hill, which practically divides the city of Rome into two parts and forms a great hindrance to traffic. The whole of the tunnel will be brilliantly illuminated by electric light and will be large enough to admit two tram lines and two pavements.

Worcester Cathedral King's School has had a new block added to it at a cost of about £3,000.

Sir Alma Tadema will be entertained at dinner by his brother artists at the Hotel Metropole on November 4th.

Two Permanent Galleries at Cheltenham, adjacent to the Library and School of Art, were opened on October 26th.

A Memorial Window at Kingston-on-Thames, in the old town hall, was unveiled by the Speaker of the House of Commons on October 26th.

Llandudno's New Town Hall will cost £20,000 and the memorial stone was laid on October 26th. The architects are Messrs. Silcock and Reay, of Bath.

Pudsey Mechanics' Institute is to be extended at a cost of about £3,000—additional class rooms will be added and the Victoria Hall will be remodelled and enlarged.

Moorish Industries at the Glasgow Exhibition of 1901 will form a prominent feature. A building will be erected in the Moorish style, in which the natives will work.

The New English Art Club.—The receiving day for pictures intended for the forthcoming exhibition of the New English Art Club at the Dudley Gallery is fixed for Monday, November 6th.

A New Wesleyan Church at Hull is being built in the newly-opened Clee district from designs by Messrs. Golden and Kitchen, of Hull. The foundation stone was laid on October 26th.

A Penalty of £45 for making a Smoke Nuisance was recently imposed on the County of London and Brush Provincial Electric Lighting Company, in respect of their works at the Causeway, Wandsworth, S.W.

German Vandalism.—Four of the royal statues on the right side of the Sieges Allee in Berlin, presented by the Emperor, have been mutilated—fingers, hands, noses, &c., knocked off. No trace of the culprits has as yet been found.

M. Alfred Stevens, the distinguished painter, is now in such a hopeless condition that a committee has been formed in Paris to organise an exhibition of his works at the École des Beaux Arts. M. Stevens is of Belgian and not of English extraction. He has lived in France all his life, and fought in the Franco-German War.

In the City Hall at Dublin a handsome marble and mosaic floor has been laid down in place of the old Portland stone one, which was worn out. The centre piece is of ceramic tile mosaic, in which the ancient coat of arms of Dublin appears. Outside this centrepiece the floor is of black and green rings of Connemara marble. The border outside the columns consists of green circles. The front entrance hall has been laid in keeping with the main hall, and with the exception of the Sicilian work, all the marble has been quarried in Ireland.

The Forthcoming Van Dyck Exhibition at Burlington House promises to be as good as the Rembrandt Exhibition last winter. The flooring of the entrance hall of the building has been taken up and the two pillars flanking the stairway have been removed. Squares of white marble, so placed as to give a diagonal effect, with much smaller squares of black stone let in at the cut-off corners, have been laid down, and marble pillars will replace those that hitherto flanked the great steps. The work is under the direction of Mr. Jackson, R.A.

An International Assembly in Paris.—It is proposed to form a general and advisory committee consisting of members of the British Association, the Association Française, and of other representatives of pure and applied science, education, art, &c., with the object of promoting arrangements for an International meeting or assembly in connection with the Exposition of 1900. The acting secretaries are Professors Mavor and Geddes, who may be addressed at 5, Old Queen Street, Westminster, London, S.W., or 95, Boulevard St. Michel, Paris.

The Restoration of Thirsk Parish Church is now completed.

Selly Oak Workhouse is proposed to be extended at an estimated cost of £11,400.

The Reconstruction of Spurgeon's Tabernacle will be completed within a few months.

The West Ham Technical Institute Classes are now held in the School Board buildings.

A New Board School at Royal Hill, Greenwich, just completed, accommodates 350 boys and girls and 200 infants.

Turner's Works at the Guildhall last summer were visited by nearly 250 000 persons. The average weekday attendance was 2,654.

A new Board School at Leeds has been built in Brudenell Road from designs by Mr. W. S. Braithwaite at a cost of about £21,370.

St. Michael's, Bassishaw, behind the Guildhall, is to be demolished for safety's sake, and the Common Council has acquired the site for £36,000.

Aberystwith County School was formerly opened on Thursday last. The architect is Mr. T. E. Morgan, of Aberystwith, and the builder, Mr. Bearne, of the same place.

A Font Cover at Grantham Parish Church has been erected at a cost of £400, in commemoration of Her Majesty's Diamond Jubilee. It is 26ft. high and is of oak.

A Police Institute in Birmingham, at the corner of Dalton Street and James Watt Street, was opened on October 25th. The architects were Messrs. Ingall and Son, and the contractor was Mr. T. Johnson.

St. Dunstan's Church, Stepney, E., is about to be extensively altered and repaired at a cost of £3,500, under the supervision of Messrs. Cutts, architects. It was originally founded in 952 and the churchyard, opened as a public garden in 1884, is noticed in the "Spectator," the "Tatler," and Boswell's "Johnson."

Additions to St. Olave's Church, York.—The new vestry that has been added at the north corner of this church is 30ft. long by 15ft. wide, with doorways opening into the chancel. A separate entrance is also provided from the churchyard. The work has been carried out in Tadcaster stone from the designs of Messrs. Demaine and Brierley, architects, York, by Mr. Ullathorne, of Selby. Mr. Hodgson, of York, executed the plumbing and glazing. The cost has been about £450.

Glasgow Students' Visits.—The students attending the building construction classes at the Glasgow High School made their first visit of the season on Saturday to the Govan Burgh Chambers and to the Lyceum Theatre. Between fifty and sixty students attended, and were conducted by Mr. Russell, building committee convener, Mr. Thomson, of Messrs. Thomson and Sandilands, architects, Mr. Brown, and Mr. David Barclay, the architect of the theatre, which will cost about £40,000.

St. Agatha's Church, Birmingham.—This church, the first of two now being erected from the proceeds of sale of two churches in central positions in the city, will present an imposing front to Stratford Road, and will have a tower about 100ft. high, flanked by spacious porches. A nave of six bays, with side aisles, will lead to the chancel, which will be 40ft. deep and have a large traceried window. Mr. W. H. Bidlake is the architect, and Messrs. John Bowen and Sons are the contractors. The cost of the church is estimated at £15,000.

Sheffield Society of Architects and Surveyors.—We have received the twelfth annual report of this society, and note that it now has 116 members, and that there is a balance at the bank of £124 3s. 9d. The officers for 1899-1900 are as follows:—President, Joseph Smith, F.R.I.B.A.; vice-president, A. Smith Denton; treasurer, F. Fowler, F.S.I.; hon. secretary, W. C. Fenton, City Chambers, 14, St. James' Row, Sheffield; council, Messrs. Joseph Smith, A. Smith Denton, F. Fowler, W. C. Fenton, R. W. Fowler, E. M. Gibbs, C. Hadfield, C. J. Innocent, T. Winder, J. B. Mitchell-Withers, and J. R. Wigfull.

St. Paul's Church, Stalybridge, has just been completed by the addition of a south transept at a cost of about £1,700.

A New Railway Station at Blaenavon is to be built by the Great Western Railway Company at an estimated cost of £2,700.

A New Primitive Methodist Chapel at Kirkburn, Driffield, has been built from designs by Mr. J. Caleb Petch, of Scarborough.

A New Free Library at Plashet Park, East Ham, which has been erected at Mr. Passmore Edwards' expense, was opened on Saturday. The architect is Mr. Silvanus Trevail, F.R.I.B.A.

Ecclesiastical Art.—The Church of Our Lady of the Rosary, Marylebone Road, N.W., was opened on Sunday on the completion of the new paintings, stained glass windows, and decorations by Mr. N. H. J. Westlake.

Amersham's Historic Meeting House.—By the erection of a new Wesleyan Chapel at Amersham, the foundation stones of which were laid recently, the old Quaker meeting house, which the local Methodists have used for the last seventy years as a place of worship, will be vacant. This antiquated structure, which is at least 250 years old, was almost the earliest to be erected by the followers of George Fox, who existed in very large numbers in the district of the Chiltern Hills. John Knox visited Amersham.

The National Photographic Record Association has received 100 prints dealing with Lincoln, Shrewsbury, the rock dwellings in Staffordshire, &c., from Sir J. Benjamin Stone, M.P. (the president). Mr. T. W. Sharp has presented some valuable records of the excavations now in progress near Glossop; some prints of the old crosses at Iona have been given by Mr. P. Ridge; some of the old houses in the Strand, &c, by Mr. E. Scamell; and some of various old churches at South Mimms, Pinner, Aldenham, &c., by the hon. secretary, Mr. Geo. Scamell.

The Arts and Crafts Exhibition Society have arranged a course of lectures by members of the Society on the Arts and Crafts movement, including the "Pre-Raphaelite School" and the "Gothic Revival," and the associated topics of Crafts and Guild Pageantry and the Masque. The lectures will be delivered during this and next month, in connection with the Arts and Crafts Exhibition, now open, and will be devoted to showing the present position of the movement, its antecedents, and possible outcome. The first lecture on the Arts and Crafts Movement will be delivered by Mr. Walter Crane, Thursday next, November 2nd.

A New Altar Cross and a pair of vases has just been presented to Westminster Abbey by Lord Rosebery, in memory of the wedding of his daughter, Lady Margaret Primrose, which took place last April. The cross, which has been placed on the high altar, is the work of Messrs. Barkentin and Krall, of 291, Regent Street, London, W. It is of silver, and the entire surface is gilt, including the medallions, as otherwise these would suffer by cleaning, or if not cleaned would turn black. The base of the cross and the two accompanying vases follow the style of the large candlesticks which the Abbey already possesses, but which have hitherto been used only on festal occasions. The cross has five medallions or plaques containing figures in relief.

Reforming the By-laws.—A deputation of the R.I.B.A. recently waited upon Mr. T. W. Russell, M.P., at the Local Government Board, to lay before him the views of the Institute on the advisability of grouping the Model Building By-laws for non-metropolitan districts in England and Wales with the view to the adoption of such groups and such only as were applicable in particular localities, the establishment of a special Tribunal of Appeal, the extension of the London system of dealing with party-walls to the provinces, and other questions connected with the administration of local by-laws. Mr. Russell, although he could not hold out any hopes of immediate legislation on the subject, promised that the suggestions as far as they did not involve legislation should have the cordial consideration of the Board.

New Patents.

The following specifications were published on Saturday last, and are open to opposition until December 11th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—20,793, Adams, door closing appliances and checks. 21,343, Hawley, pressing and securing sectional blocks of timber to form rectangular or square blocks. 21,584, Homan, fireproof floors, ceilings, or the like. 22,120, Killick and Cochran, combination safety steam cock and door latch. 22,791, Kershaw, guard for surfacing or hand feed planing machines. 22,865, Little, elevators. 23,232, Lee, blowers and draught regulators for use in domestic grates or open fireplaces. 23,489, Brown, hinged sliding window sashes to open inwardly. 23,526, Woods, devices for automatically closing doors and the like. 23,724, Mountford and B. Dellagana and Co., Limited, means and their manufacture for effecting the coloured decoration of pottery. 23,792, Doyle, flushing valves. 24,381, Hiscock, sliding windows. 24,666, Ducat, tipping troughs for distributing sewage and other foul liquids on filter beds. 25,000, Thompson (*Gsell*), process for purifying waste water or sewage by precipitation. 25,400, Jewhurst, stoves or fireplaces. 25,575, Brearley, manufacture of prismatic glass refracting means. 25,808, O'Donahue and Halden, surveying instruments to be used in mines or elsewhere. 26,367, Davidson, centrifugal fans and pumps. 27,008, von Forell, manufacture of cement and apparatus therefor.

1899.—227, Taylor, manufacture of locking or fastening attachments for securing knobs to spindles. 1,258, Broadbent and Broadbent, jaws of machines for crushing or breaking stones, ores, and the like. 12,662, Taylor, means for connecting outlet pipes from closets and like places to soil or waste water pipes. 12,928, Forney, combined bolt and lock (date applied for under International Convention, November 22nd, 1898). 14,299, Brainard, fountains. 15,659, Finch, kilns for burning sewer pipes and other articles of clay manufacture. 15,789, Day (*Smart*), machines for manufacturing metal hinges. 16,221, Lake (*Peck, Bros. and Co.*), wash basins. 16,328, Dubuisson, water meters and the like. 16,800, Stewart, manufacture of lead sockets for rain, water, waste, soil, ventilating, and other pipes. 16,809, Haedicke, apparatus or device for drawing curves. 17,753, Fry, corner plates for stair steps, window sills, room floors, and like places.

The following abridged description is specially drawn up for The Builders' Journal and Architectural Record *by Messrs. Hughes and Young, Patent Agents, 55 and 56, Chancery Lane, London, W.C., who will give advice and assistance free to our readers on all Patent matters.*

9,812. Piling Timber. — Patentees: G. B. J. and J. Groves, both of the London Sawing Mills, Lawson Street, Great Dover Street, Southwark, S.E. This invention is designed for piling timber. A crane post is secured by clamps to the projecting ends of planks. The planks are then raised to the top of the pile by a lifting rope which passes around guide pulleys. A platform pivoted to an adjustable clamp is fitted to serve as a support for the planks. By means of a rope passing around a pulley the crane post can be raised as the pile rises.

14,247. Scaffolding and Staging.—Patentee: F. Knoeferl, of Oseney Crescent, Kentish Town, N. A movable cradle for builders, house decorators, &c., is suspended from two points of the building by ropes and lifting tackle so that it can be moved sideways as well as upwards and downwards. The cradle may be constructed of bars rigidly connected together, or of two parts so connected together by links that the flooring boards are always maintained in a horizontal position. The right-hand part supports the left side of the floor by a cross-bar or pivot, while the left half supports the right hand part of the floor on a similar cross-bar or pivot. The suspending lines are attached to eyes at the upper end of the bars.

14,283. Moulding Bricks.—Patentee: F. C. Norris, of Griswald House, Detroit, Michigan, U.S.A. Moulding-presses for bricks made from sand and a binding-agent. The mould has movable sides and ends, which are drawn out of contact with the bricks before it is ejected. In the drawings accompanying the specification a plan is shown of a mould composed of four parts, which by means of a rotary casing and toggle-levers are moved away from or towards one another. The casing for these purposes is rotated from a spindle by means of rods. A lever on the lower end of the spindle engages with a grooved cam on the shaft. The feed-slide is moved over the mould by a lever engaging with a cam groove in the driving wheel, and during its forward stroke removes from the plunger the previously formed brick. A cam operates the bell crank to raise and lower the collar secured to a pair of rods carrying the upper die, while a second cam actuates a toggle-joint by which the plunger is operated. A spring attached at one end to the collar tends to keep the joint closed, this closure being limited by a stop.

14,304. Preventing Dampness of Plaster. — Patentee: C. Fleisch, of St. Johann-on-the-Saar, Germany. The object of this invention is to prevent dampness of the plaster and exudation of moisture on the surface. Pulp boards, such as used for roofing purposes, are covered on both sides with a hot bituminous mixture of asphalte, petroleum, sand, ashes, &c., and nets of hemp, jute, or similar material are stretched over the outer faces to retain the plaster. The edges of the nets are secured to the back edges of the board by a second layer of the hot bituminous mixture. The boards may be roughened or grooved by pressing them between grooved rollers or plates. When nailed to the wall, air spaces are formed between the boards and the wall, and perforations may be made through the boards to allow moisture to escape. The boards may be applied to existing buildings by removing the damp plaster, nailing the boards in place, and plastering them over.

14,394. Slabs for Building and Decorative Purposes.—Patentee: W. Anthony, of Trier, Prussia. Relates to the manufacture of metal faced slabs for use as wall and ceiling coverings, and to the making of doors, furniture, partitions, &c. Asbestos boards are coated with water glass and sprinkled with glass or emery powder. When quite dry, metal plates are attached under pressure by cement composed of casein, hydraulic lime, chalk, emery powder, and burnt magnesia. The edges of the boards are then coated with some waterproofing material, and the edges of the metal plates, which were left projecting, are then turned down. Slabs that are to be subject to water or moisture are steeped in a bath of chloride of magnesia dissolved in alcohol before being coated with the water glass. If the slabs are required to be highly fire-resisting, steel plates only are used, but otherwise, softer metals such as zinc, nickel, aluminium or brass may be employed.

A New Methodist Church at Handsworth is being built from the designs of Mr. J. G. Dunn, by Mr. T. Ewins. The total estimated cost is £4,500.

An Eel in a Service Pipe.—The water supply to the Constitutional Club in Northumberland Avenue, London, was suddenly cut off a few days ago, and it was discovered that an eel, weighing 2½lb., had become firmly wedged in the service pipe leading to the meter, thus completely shutting off the water supply. It was nearly four hours before the mischief could be remedied.

New Companies.

Oliver Goddard and Co., Limited.

This company was registered on October 17th by Mann and Crimp, 17, Essex Street, Strand, with a capital of £5,000 in £1 shares, to adopt an agreement with O. J. Goddard, and to carry on business as dealers in bricks, tiles, terra-cotta, timber, china; to acquire and turn to account any real or personal property, concessions, patents, machinery, ships, barges, rolling stock, plant, and stock in trade; to negotiate loans, &c.

Gypsine Brick Company, Limited.

This company was registered on October 20th by Cheston and Sons, 1, Great Winchester Street, E.C., with a capital of £1,800 in £1 shares, to acquire and work patents and secret processes for the manufacture and production of bricks, slabs, planks, or blocks suitable for building purposes; to adopt an agreement made between this company with E. Glaenzer; to develop and extend the said business; and as claypit owners, brickyard and mill owners, engineers and machinists, &c.; and to acquire and turn to account any real or personal property.

Midland Plastering Company, Limited.

This company was registered on October 19th by Leman and Co., 73, Basinghall Street, E.C., with a capital of £10,000 in £1 shares, to carry on in all or any of the respective branches the businesses of plasterers, lime and cement workers, quarry owners, stone merchants, lime owners, brick, tile, and terra-cotta makers, timber merchants, sawmill proprietors, general engineers, electricians, ironfounders, wire-workers, &c.; to acquire and turn to account any lands, estates, real or personal property, patents, patent rights, &c. The directors are to be elected by the signatories. Qualification, £100. Remuneration, £50 per annum each.

Fowey China Clay Company, Limited.

This company was registered on October 18th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £25,000 in £1 shares, to acquire, upon the terms of a certain agreement, the businesses of china-clay and stone merchants, as now carried on under the respective styles of A. Lechenich and Co. and the Fowey China Clay Company, Limited, at Fowey, Cornwall, and to carry on the business of workers of and dealers in china, porcelain, fire-clay, brick and tile makers, terra-cotta ware; as papermakers, chemical manufacturers, glue makers, &c. There are to be not less than two nor more than five directors. Managing director, A. C. A. Lechenich.

Anglo-French Syndicate, Limited.

This company was registered on October 17th by Ingle, Holmes and Sons, 20, Threadneedle Street, E.C., with a capital of £30,000 in 29,900 £1 ordinary shares and 2,000 1s. deferred shares, to carry on the businesses of miners, metallurgists, builders, contractors, engineers, farmers and graziers, shipbuilders, shipowners, wharfingers, carriers, warehousemen, hotelkeepers, storekeepers, merchants, importers and exporters, and to deal in property of all kinds; as bankers, financiers, company promoters, concessionnaires; to construct and maintain rail and tram roads, &c. The directors are to be elected by the signatories.

Thomas Crawshaw, Limited.

This company was registered on October 16th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £5,500 in £1 shares, to carry on in the United Kingdom or elsewhere the business of shuttle, spring, peg, and tag manufacturers, box, packing case, and pattern makers, timber merchants, joiners, builders, undertakers, contractors, patent fuel manufacturers, corn grinders, seed crushers, oil cake manufacturers, general mill furnishers, match manufacturers, &c.; to acquire and turn to account any patents, patent rights, &c.; to establish and maintain gas and electric works; as builders and contractors, &c. The directors are to be elected by the signatories. Qualification, £250. Remuneration, £25 per annum each.

COMING EVENTS.

Wednesday, November 1.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration in the parish of St. George, Hanover-square, at 2 p.m., conducted by Mr. Albert Taylor, chief sanitary inspector. J. Wright Clarke on "Details of Plumbers' Work." 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of members. 8 p.m.

Royal Archæological Institute of Great Britain and Ireland.—(1) Judge Baylis, M.A., on "An old Doorway and Staircase recently found in the East Wall of the Inner Buttery of the Inner Temple." (2) Mr. F. J. Haverfield, M.A., on "The Sepulchral Banquet on Roman Tombstones." 4 p.m.

British Archæological Association.—(1) Mr. C. H. Compton on "The Recent Discoveries at the Tower." (2) Mr. A. S. Walker on "The Guildhall Porch." 8 p.m.

Institute of Sanitary Engineers (Incorporated.)—Election Committee, 2.30 p.m. Council meeting, 2.30 p.m. General Purposes Committee, 5 p.m.

Thursday, November 2.

Worshipful Company of Carpenters.—(Lectures on Sanitary Building Construction.)—Mr. Keith D. Young, F.R.I.B.A., on "Principles of Ventilating and Warming Buildings." 7.30 p.m.

Arts and Crafts Exhibition Society (New Gallery, Regent-street, W.).—Mr. Walter Crane on "The Arts and Crafts Movement; its general tendency and possible outcome." 8.30 p.m.

Friday, November 3.

Architectural Association.—(Discussion Section.)—Mr. G. H. Smith on "Brasses." Mr. E. Swinfen Harris, F.R.I.B.A., will attend as special visitor. 7 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. W. C. Tyndale, M.I.C.E., on "House Drainage." 8 p.m.

Institution of Junior Engineers (Westminster Palace Hotel). — Presidential address by the Hon. Charles A. Parsons, F.R.S. 8 p.m.

Saturday, November 4.

Dundee Institute of Architecture.—Mr. P. H. Thoms on "Art in the Home."

Sanitary Inspectors' Association.—Extraordinary General Meeting at Carpenters' Hall, London Wall, E.C. Inaugural address by Mr. W. H. Grigg, chairman of Council. 6 p.m.

Monday, November 6.

Royal Institute of British Architects. — Mr. William Emerson, President, will deliver his opening address of the Session. 8 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers).—Mr. Charles Jones, M.I.C.E., on "Scavenging and Disposal of House Refuse." 8 p.m.

Society of Engineers.—Mr. Sherard Cowper-Coles on "The Electrolytic Treatment of Complex Sulphide Ores." 7.30 p.m.

London Institution.—Professor W. Boyd Dawkins, M.A., F.R.S., on "The Place of the Welsh in the History of Britain." (Illustrated.) 5 p.m.

Wednesday, November 8.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at Common Lodging House. Prof. Henry Robinson, M.I.C.E., on "Sewerage and Sewage Disposal."

Edinburgh Architectural Society.—Mr. Robert Wilson on "The Planning of Schools." 8 p.m.

Thursday, November 9.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers).—Demonstration of Book-keeping as carried out in a Sanitary Inspector's Office, in the Parkes Museum at 8 p.m., by Mr. Albert Taylor.

London Institution.—Professor W. M. Flinders Petrie, D.C.L., on "Prehistoric Egypt." (Illustrated.) 6 p.m.

Arts and Crafts Exhibition Society (New Gallery, Regent-street, W.).—Mr. H. Wilson on "The Pre-Raphaelite School in Relation to the Revival of Design and Handicraft." 8.30 p.m.

Friday, November 10.

Architectural Association.—Mr. W. Brindley on Marble." 7.30 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. Reginald Dudfield, M.A., M.B., on "The Practical Duties of a Sanitary Inspector." 8 p.m.

Saturday, November 11.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstration at the Sewage and Destructor Works, Ealing, at 2.15 p.m., conducted by Mr. Charles Jones, M.I.C.E.

Improving the Coventry Streets.—At the last meeting of the Coventry City Council the General Works Committee presented a report recommending the Corporation to obtain powers in the next session of Parliament to carry out several important street improvements. It is proposed to acquire a large number of properties with the view of widening some existing thoroughfares, and making a new street from Gosford Street to the railway station. In the centre of the city, where new municipal buildings are to be built, it is intended to continue the widening of Earl Street up to Hay Lane, and to acquire property in the lane and also in Bayley Lane. St. Michael's Baptist Chapel is also scheduled for acquirement. The Council adopted the Committee's report.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARKING (Essex).—For additions to school, Gascoigne-road, for the School Board. Mr. C. J. Dawson, architect, East-street, Barking:—

Reed and Son	£5,750	Davies and Leaney ...	£4,800
Godfrey and Son... ...	5,624	Garbett	4,725
Knight and Son	5,243	Shelbourne and Co., Southend-on-Sea* ...	4,570
Critcher	5,211		
Carter	5,120		

*Accepted.

BIRMINGHAM.—For the erection of new depôt, public offices, etc., Stratford-road, Sparkhill, for the Yardley Rural District Council. Mr. Arthur Harrison, architect, Queen Chambers, Colmore-row, Birmingham. Quantities by Mr. Anthony Rowse, 3, Newhall-street, Birmingham:

Harley and Son ...	£11,545	Whitehouse and Sons	£10,986
Moffat and Sons ...	11,380	Whittall and Son ...	10,860
R. Fenwick	11,095	F. Davis...	10,782
F. J. Briley	11,085	W. Bishop, King's Heath (accepted) ...	10,687
Bowen and Sons ...	11,065		
H. Gibbs	11,029		

BRIGHTON.—For the construction of engine and boiler-house, &c., Mill Oak Pumping Station, Portslade, for the Town Council. Mr. F. C. May, Borough Engineer, Town Hall, Brighton:—

R. R. Berry	£10,631	Sattin and Evershed ...	£9,568
A. E. Nunn	10,240	Longley and Co., Crawley (accepted)	9,449
Kirk and Randall ...	9,885		

BRIGHTON.—For the erection and completion of a pair of semi-detached villas in the Tivoli-crescent, Dyke-road, Brighton, for Mr. F. J. Foulger. Mr. H. M. Nye, architect, 47, Hova-villas, Hove:—

H. J. Penfold	£1,817	S. C. Smale	£1,384
W. Humphrey	1,600		

BURTON-ON-TRENT.—Accepted for the erection of No. 2 block of artisans' dwellings, for the Burton-on-Trent Artisans' Dwellings Company, Limited. Mr. Thomas Jenkins, architect, 35, High-street, Burton-on-Trent. Quantities by the architect:—

Henry Edwards	£3,937 10

CARDIFF.—For the erection of a branch library, Roath, for the Corporation. Messrs. Teather and Wilson, architects, Queen-street, Cardiff. Quantities by the architect:—

Jerrard Hallett	£2,960	A. J. Howell...	£2,675
F. Williams	2,900	W. T. Morgan	2,603
Thos. Evans	2,882	Knox and Wells	2,566
Shepton and Son... ...	2,775	Thomas and Sons ...	2,560
Williams and Thomas	2,750	Marsh and Wride ...	2,525
Turner and Son	2,728	Chubb and Co., Cardiff (accepted)	2,468
Evans and Bros.	2,700		

CLUTTON (Somerset).—Accepted for the erection of forty miners' cottages at Greyfield Colliery, for the Right Honourable Earl of Warwick. Mr. William F. Bird, architect, Midsomer Norton, Somerset. Quantities by the architect:—

Tom Keeling, Timsbury, near Bath	£6,360

CROMFORD (Derbyshire).—Accepted for the construction of a Wesleyan Chapel and school premises. Mr. William F. Bird, architect, Midsomer Norton, Somerset. Quantities by the architect:—

William Boden, Matlock Bank	£1,927

ILFORD.—For the erection of Downhall school, for the School Board. Mr. C. J. Dawson, architect, 7, Bank-buildings, Ilford. Quantities by Messrs. Gardiner and Theobald:—

Gregar and Son... ...	£26,545	Dearing and Son ...	£24,060
Knight and Son ...	25,997	W. Shepherd	23,845
Shillitoe and Son ...	25,000	Hockley and Son ...	23,800
Reed and Son	24,990	Hammond and Son, Romford*	21,802
Rider and Son	24,130		

* Accepted.

ISLEWORTH.—For erecting new workhouse at Isleworth, for the Guardians of the Poor. Mr. W. H. Ward, architect, Birmingham. Quantities by Mr. F. W. Miller, London:—

Leeder and Co.... ...	£133,033	Pattison and Sons ...	£90,000
Shillitoe and Son ...	103,400	W. Wisdom	87,000
Cowley and Drake ...	101,655	Messom and Sons ...	86,815
H. G. Lovatt	99,108	Dorey and Co., Brentford*	82,633
B. E. Nightingale ...	97,573		
Wilcock and Co. ...	93,125		

* Accepted.

CONTRACTS OPEN.

RUGBY URBAN DISTRICT COUNCIL.

RUGBY AND LUTTERWORTH MAIN ROAD IMPROVEMENT.

TO CONTRACTORS AND OTHERS.

THE URBAN DISTRICT COUNCIL OF RUGBY invite TENDERS for Kerbing and Channelling the Roadway, Paving the Footpaths, and Laying a Surface Water Drain in the Rugby and Lutterworth Main Road, from the Bridge over the River Avon to the Park Gates, North-street.

The drawings can be seen, and a copy of the specification, bill of quantities, and form of Tender obtained on application at my office, and on payment of One Guinea which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Main Road Improvement," to be sent to Mr. T. M. WRATISLAW, Clerk to the Council, on or before NOVEMBER 18th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
D. G. MACDONALD, Assoc. M. Inst. C.E.,
Surveyor.

Rugby,
October 26th, 1899. 2

ASPINALL'S ENAMEL LTD., NEW CROSS, LONDON, S.E.

RUGBY URBAN DISTRICT COUNCIL.

OUTFALL SEWER—NEWBOLD-ROAD.

TO CONTRACTORS AND OTHERS.

The Urban District Council of Rugby invite TENDERS for LAYING a 12in. OUTFALL SEWER from a Manhole near the end of Dale-street, to Newbold-road, thence along Newbold-road to a Manhole at the end of North-street near the Park Gates.

The drawings can be seen, and a copy of the specification, bill of quantities, and form of Tender, obtained on application at my Office, and on payment of One Guinea, which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Outfall Sewer," to be sent to Mr. T. M. WRATISLAW, Clerk to the Council, on or before NOVEMBER 18th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
D. G. MACDONALD,
Assoc. M. Inst. C. E., Engineer and Surveyor.
Rugby, October 26th, 1899. 2

WALTHAMSTOW SCHOOL BOARD.

TO BUILDERS AND CONTRACTORS.

The Walthamstow School Board invite TENDERS for the ERECTION of NEW SCHOOL BUILDINGS in Blackhorse-road Walthamstow.

The drawings and specification may be seen, and bills of quantities obtained, at the office of the Architect, Mr. W. A. LONGMORE, F.R.I.B.A., No. 7, Great Alie-street, London, E., between the hours of TEN a.m. and FOUR p.m. (except on Saturdays).

A £5 note must be deposited for the quantities, and another £5 note must be inclosed with the Tender, both of which will be returned to those sending in bonâ-fide Tenders.

Tenders to be endorsed "Tender for New Schools," and to be addressed to the Clerk of the School Board, Clevelands, High-street, Walthamstow, and delivered not later than SEVEN o'clock on TUESDAY, NOVVEMBER 7th, on which day they will be opened at EIGHT p.m.

The Board do not bind themselves to accept the lowest or any Tender.

T. W. LIDDIARD,
Clerk to the Board.
School Board Offices,
High-street, Walthamstow,
October 18th, 1899.

N.B.—In the case of all workmen to be employed by the contractor he will be required to pay wages at rates not less, and observe hours of labour not greater, than the Board's list, such rates of wages and hours of labour will be inserted in the schedule to, and will form part of the contract, and shall be held to apply to any work done in connection with the contract, within a radius of twenty miles, measured in a straight line from Charing Cross, and penalties shall be enforced for any breach thereof.

COMPETITION.

URBAN DISTRICT of LYMM.

The Council propose to spend £2,800 in the ERECTION of COUNCIL CHAMBER and OFFICES in Whitbarrow-lane, Lymm, and invite architects to submit competitive designs.

Two premiums are offered to competitive architects—

£25 for the accepted design, and
£15 for the design placed second.

The premiated designs will become the absolute property of the Council to adopt in whole or in part without further payment, and the architect whose designs are selected may be required to carry out the work, in which case the premium will merge into the Commission.

Plan of site, with instructions, may be obtained on personal application to the Clerk of the Council during office hours.

Sealed designs, endorsed "Proposed Council Chamber and Offices," to be delivered to the undersigned on or before DECEMBER 15th, 1899.

By order,
W. MULLARD,
Clerk of the Council.
Council Offices, Lymm,
October 20th, 1899.

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

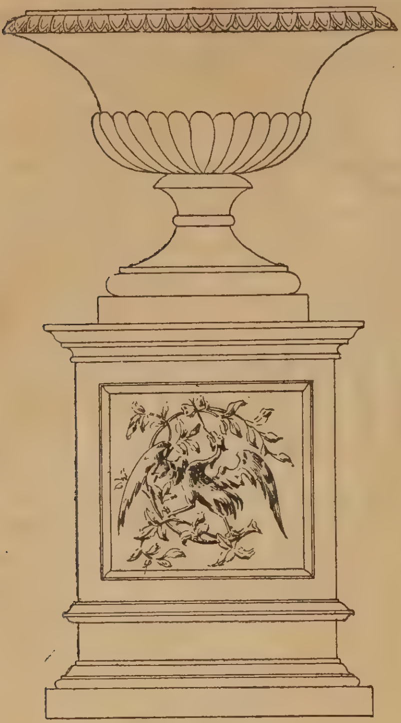

FIG. 1. DESIGN FOR GARDEN VASE.

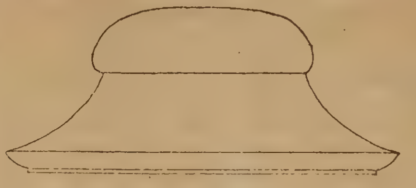

FIG. 2. BODY OF VASE WITHOUT ORNAMENT.

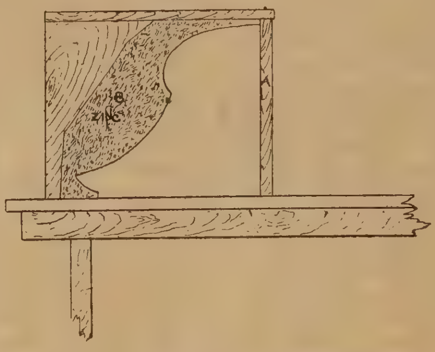

FIG. 3. APPARATUS FOR CONSTRUCTING BODY OF VASE.

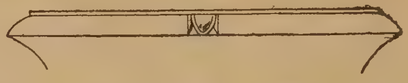

FIG. 4. SINGLE REPEAT OF DESIGN ON RIM.

A TERRA-COTTA GARDEN VASE.

By WILLIAM REID.

THE garden vase shown at Fig. 1, though perhaps of as common a pattern as any, will serve as a model to show how such an article is manufactured in terra-cotta. As has been said in former articles, the first process is to make a model of the object—usually in plaster-of-Paris. If the vase were stripped of all its ornamentation its appearance would be as shown at Fig. 2, and this is the shape that has to be turned in plaster. In this figure the body of the vase only is shown, the neck being made separately. In a previous article in THE BUILDERS' JOURNAL (No. CCXVIII.) an illustration was given showing a sort of lathe on which round balusters were turned in plaster. A similar lathe might be used for turning a vase if this is not too big; if, however, the vase is large and bulky, it is usual to fit up an arrangement like that shown at Fig. 3. It will be seen that if plaster is built up and around the upright support A, and the template B is swung round, a shape similiar to Fig. 2 will be produced. In turning out a piece of work like this it is not, however, necessary that it should be of plaster throughout. This, to some extent, would be wasteful, and it is therefore usual to wrap old sacks or straw round the central upright and to fill up with any odd pieces of plaster, simply binding this packing together with a few handfuls of newly-gauged plaster. It is only when this core approaches the zinc template that fresh plaster need be used. The ornament is next modelled on the body. In the case of the egg and dart moulding round the rim of the vase, it is only necessary to model one unit or repeat, as at Fig. 4. A mould is made and clay pressings taken and adjusted to the rim, remembering that before these pressings can be made to adhere to the plaster it is necessary to varnish the model. This was explained in the article on a design for a gable tympanum, in No. CCXXVIII. The neck is turned in a lathe in the same way as a baluster. The pedestal is made by joining together four slabs of plaster, in the manner illustrated at Fig. 5, and adding the mouldings to the top and bottom afterwards. The plaster slabs are held together by filling up the corners with newly-gauged plaster, but it will be found necessary to thoroughly wet the corners before this is done, otherwise the moisture in the plaster will be absorbed by the dry slabs, and not only will proper setting be prevented, but the adhesive strength will be impaired. The neck is moulded in exactly the same way as a baluster, and the pedestal like the moulding (see Nos. CCXV. and CCXVI). The moulding of the vase itself requires somewhat different treatment. The rim is the first part moulded. It is necessary to sink an iron wire or rod into this part of the mould to prevent the chance of breakage. The rod is first bent into a hoop slightly larger than the rim, and is dropped into the newly-applied plaster before it has quite set. Then the vase is turned over so as to rest on its rim, as shown at Fig. 6. The remaining moulding must be done in several pieces, the number of which will depend on the size and design of the vase. In the present instance four or six pieces will suffice. Set out two walls of clay about 12in. high (Fig. 6) and fill up the enclosed space with plaster. This piece is trimmed up, as shown at Fig. 7, and another wall of clay built up as indicated by the dark line on the drawing. This piece is treated as in the previous case, and similar pieces are added until the whole presents an appearance like Fig. 8. The mould is completed by adding the case, as at Fig. 9.

It is scarcely necessary to add more, as if reference is made to the back numbers of this journal sufficient details will be found as to how the moulds are filled with clay, and how the clay pressing is further treated before being set in the kiln.

Surveying and Sanitary Notes.

London Main Drainage.—A conference of representatives of the leading parishes north of the Thames was held on Friday at the Paddington Vestry Hall, when a resolution was carried urging the L.C.C. to improve the main drainage system north of the river. (See page lxi. of the supplement to No. CCXLII.)

A New Method of Making Artificial Stone. — Artificial paving stones are now made by mixing coal tar with sulphur, adding chlorate of lime to the resulting semi-liquid mass. After cooling, the mass is broken into small pieces, and mixed with glass or blast furnace glass slag, the powder being then subjected to a pressure of 200 atmospheres and reduced to the form desired. The advantages claimed are: Durability equal to that of many stone roads, resistance to changes of temperature, a roughness of surface which gives horses a good foothold, a non-transmission of sound, and, as the joinings are very small, dirt is avoided and cleaning is very easy.

Oldham Corporation Fined for Making a Nuisance.—At the Chadderton Police Court recently the Oldham Corporation were summoned under Section 114 of the Public Health Act at the instance of the Manchester Corporation for causing a nuisance at their works at Bower Clough, Hollinwood.—Mr. Rhodes, in opening the case for the prosecution, described the processes carried on at the works. The nightsoil was carted from the town and placed in tanks, and mixed with cotton shoddy, which absorbed the moisture and was used as manure. These processes caused a nuisance in the neighbourhood, and also constituted a danger to the health of the residents in the vicinity. Dr. Niven, medical officer for the City of Manchester, said that the smell caused was not only nauseous and offensive, but actually dangerous to health, as likely to carry bacteria. A number of sanitary inspectors in the employment of the Manchester Corporation and residents in the district gave evidence of the existence of the nuisance.—Mr. Hallsworth, for the defence, denied the existence of the nuisance. The works could not be carried on without creating a smell, but that smell was not such as to cause injury or discomfort to the residents round about. In the present circumstances of Oldham they could not do without such a depot, but they were doing all they could to get the people to adopt the water-carriage system, and the Corporation intended to promote a Bill in Parliament, one of the clauses of which would do much to remedy the evils complained of at the depot.—A number of residents near the works gave evidence to the effect that there was no nuisance.—The magistrates said they were satisfied that there was a nuisance, and that it had not been shown that the defendants had used the best means to abate it.—A fine of 40s. and costs was imposed.

Masters and Men.

Compensation to a Brickworks Employee.—Judge Raikes, Q.C., sitting in his private room at the County Court, Barnsley, had before him an action under the Workmen's Compensation Act in which James Tompkins (14), oiler at a brick-pressing machine, son of John Tompkins, carter, of 23, Cherrytree Street, Elsecar, sued James Smith and Co., brick manufacturers, of Skiers Spring Brickworks, Hoyland, to recover damages for injuries sustained at his work. After hearing the evidence, his Honour was of opinion that if the lad had not positive orders he had consent to what he was doing when the accident happened, and he therefore allowed £1 5s. 8d. as half-wages for eight weeks, and £2 for permanent injury, with costs.

Engineers and Parliamentary Representation.—Members of the Amalgamated Society of Engineers are determined upon obtaining direct representation in the next Parliament, and arrangements toward this end are being steadily pushed forward. A levy of 3d. per member has been agreed to, and the income resulting will amount to £300 a year. The feeling at present seems to be in favour of contesting three constituencies, and, if this should be the decision of the general body of A. S. E. members, Gorton, Newcastle, and Sunderland are considered the likeliest places for the purpose, owing to the large proportion of engineers in the population of these districts. This, however, is a matter for the consideration of the society, and the rank and file will also have an opportunity of deciding the question of who shall be the candidates for Parliamentary honours.

The Leeds Building Dispute.—Little has of late been heard of the differences between the masters and men engaged in the Leeds building trade. After a period of quiescence the parties have been engaged in an interchange of views, and, in the case of the Manchester Society of Bricklayers, with tangible results. For about five months the members of this association have been working on perfectly amicable terms with the employers, but without rules. Within the last few days, however, they have, at a conference with the masters, agreed to and signed a code of regulations which shall henceforth govern the industry so far as they are concerned. This code embodies the 1896 rules *en bloc*, with the important addition of a proviso under which future disputes are to be discussed by a standing joint committee before either party proceeds to extreme measures. Masters and operatives will, of course, be equally represented on the Conciliation Committee. It may be remembered that the 1896 rules referred to were the outcome of the protracted strike in the summer of that year. The London Order still maintain the strike, which they entered upon shortly after the lock-out on May 6th, but as a matter of fact the duties of the Strike Committee have for some time been reduced to a minimum, practically the whole of the members having obtained employment away from Leeds, or with non-federated masters at home. Informal negotiations have now been opened with the view of bringing the members of this order and the employers together. Already representatives of the two parties have met, and a definite decision, either one way or the other, may shortly be expected. It will be remembered that, apart from the lock-out of May, the London Order had demanded an increase of a penny per hour.

Ladders and Scaffolding: Another Case.—A painter named James McDonald recently sued Messrs. Hobbs and Samuel, house painters, for compensation under the Workmen's Compensation Act, and the case came before the Scottish Court of Session on October 17th. It appears that whilst McDonald was painting some joists in the Dead Meat Market, Glasgow, the ladder on which he was standing (which was provided by the defendants) was violently knocked by the carcase of a bullock swung by the stall occupier, and he fell to the ground, fracturing his skull. The Sheriff-Substitute had decided that as the building was not being repaired by means of a scaffolding within the meaning of the Act, the accident was not one cognisable under the Act, and dismissed the application. The question of law for the opinion of the Court was whether the ladder used by the appellant at the time of the accident was "a scaffolding" within the meaning of the Act. The Court (Lord Young differing) decided the question in the negative, and found the defendants entitled to expenses.—The Lord Justice-Clerk said it had been already decided by a Court in England that a ladder when used as a ladder was not a scaffolding. If the Legislation had meant a ladder to be equivalent to a scaffolding in the sense of the Act they would have said so.—Lord Young said he was quite of opinion that painting a beam was not "repairing;" whether a scaffolding or a ladder was used in the painting, the case was not one that came within the meaning of the Act. They were told at the Bar that the building was in course of being repaired by means of a scaffolding, and if that was so it was idle to decide that a ladder could not possibly be a scaffold although used for the purpose of erecting a building or repairing it. He thought the case should go back to the Sheriff-Substitute for inquiry upon the point. He should just like to add that if that ladder had been used for the purpose of building or repairing he should not have been disposed to hold that because it did not answer the meaning of a scaffold the case would not come under the statute. Lords Trayner and Moncreiff agreed with the Lord Justice-Clerk.

What is a Scaffold?—His Honour Judge Whitehorne delivered judgment at Birmingham last week in the case of Sutton v. Whitehouse, which was an application made under the Workmen's Compensation Act by Thomas Sutton, a bricklayer, 121, Great Tindal Street, Ladywood, for 16s. 8d. per week from his employers, B. Whitehouse and Sons, builders and contractors, 110, Monument Road, Birmingham. The evidence showed that in June last the applicant fell from a ladder whilst repairing the roof of a house and received such injuries that he was incapacitated for work. The defence raised was that the applicant was working on a ladder and not on a scaffold; therefore the Act did not apply. One witness said that the two ladders used were roped together, and a footboard which was on the roof was fastened to the top ladder, the whole being secured to the wall of the building by a hook, thus constituting a temporary structure which would come within the meaning of the Act. A witness called for the defence denied that the ladders were secured in any way. In delivering judgment his Honour pointed out that the question was raised as to what was really meant by a scaffolding under the Workmen's Compensation Act. The seventh section of the Act applied only "to employment on, in, or about any building which exceeds 30ft. in height, and which is either being constructed or repaired by means of scaffolding." It was admitted in this case that the building was more than 30ft. in height, and there was no question about it being repaired. The only question was whether the building was being repaired by means of a scaffolding. The employment of scaffolding was, according to the Act, a condition precedent to the obtaining of any relief under the Act in respect of an accident that had happened in the course of repairing a house above 30ft. in height. He had, in the case of Williams v. Upton, decided on January 17th last, stated in that judgment that "it was clear that a scaffolding must be a construction, an edifice consisting of several items furnishing a platform on which a man or men might stand. Whether the erection was of greater or less complexity, and of greater or less size and permanence, seemed to him to be immaterial. Once given a construction for such a purpose, and of such a character, it was a scaffolding under the Act." To that definition he entirely adhered. His Honour could not say that in this case there was an edifice, a construction in the nature of a platform upon which the man was standing when the accident happened, and therefore he must decide the case directly within the dictum of the learned President of the Court of Appeal—that no man in his senses could say that a ladder was a scaffolding. Consequently he must decide against the workman and in favour of the employer.

Engineering Notes.

A Marine Lake at West Kirby, Birkenhead, 1,100yds. long and 150yds. wide, has just been completed.

For Electric Lighting Improvements at Leicester, application is to be made to the Local Government Board for sanction to borrow £100,000.

Singular Accident at Leeds.—Two men were recently excavating around a gas lamp off West Street, Leeds, when they were suddenly overcome by an escape of gas and rendered unconscious.

A Twenty-Five Years Want Supplied.—For the last quarter of a century the inhabitants of Ledbury have been waiting for a supply of water. It has now arrived—from the new pumping station at Massington. The water is pumped from the well into a large reservoir at The Cross Hands, one mile from the town.

The Small Heath Bridge, Birmingham.—At the meeting of the Birmingham City Council on October 24th the recommendation of the Public Works Committee was adopted to build a bridge across the Great Western Railway, so as to connect Small Heath and Sparkbrook. The bridge will be 316 yards long, will have five piers, and is estimated to cost £49,000. At the same meeting it was decided to erect additional stabling, &c., at Lancaster Street Wharf, at an estimated cost of £2,000; to carry out sewage and surface-water drainage works at Highfield Road, Saltley Viaduct, Windsor Street, and Anthony Road, at a cost of £1,660; and to continue College Street, Spring Hill, to Roseberry Street, at an estimated cost of £912.

Destroying Bridges by Electricity.—A novel means of destroying a wooden bridge by electricity has recently been successfully used by American engineers. The bridge consisted of three spans with a 70ft. draw over a navigable stream, the total length of the bridge being 735ft. Each span was composed of nine chords of three timbers each, and by cutting these twenty-seven sills simultaneously the spans dropped into the river between the piers. This cutting was done by burning through the wood by loops of iron wire made redhot by an electric current. Weights were fastened to the bottom of each loop to pull it down as it burned through the timber. An alternating current at fifty volts was used. One span was wrecked at a time, one hour forty minutes being required in each case from the turning on of current until the fall of the span.

A Big Tramway Scheme.—A huge scheme of electric tramways for the northern part of Surrey, that will be submitted to the London County Council on November 14th, includes lines connecting Hammersmith Bridge with Barnes, Mortlake, and Richmond, one from the London county boundary at Wimbledon Common, passing over Kingston Hill to Kingston; others connecting Tooting Junction with Mitcham, Carshalton, and Sutton, approaching Croydon urban boundaries at several places, and an extension from these by two routes to Raynes Park, through Wimbledon and through Merton. From Raynes Park it will pass across country to New Malden, thence onward to Kingston, where it will throw a branch northward towards Richmond, as far as Ham Common, and so from Kingston through Surbiton, with several subsidiary routes to Ditton.

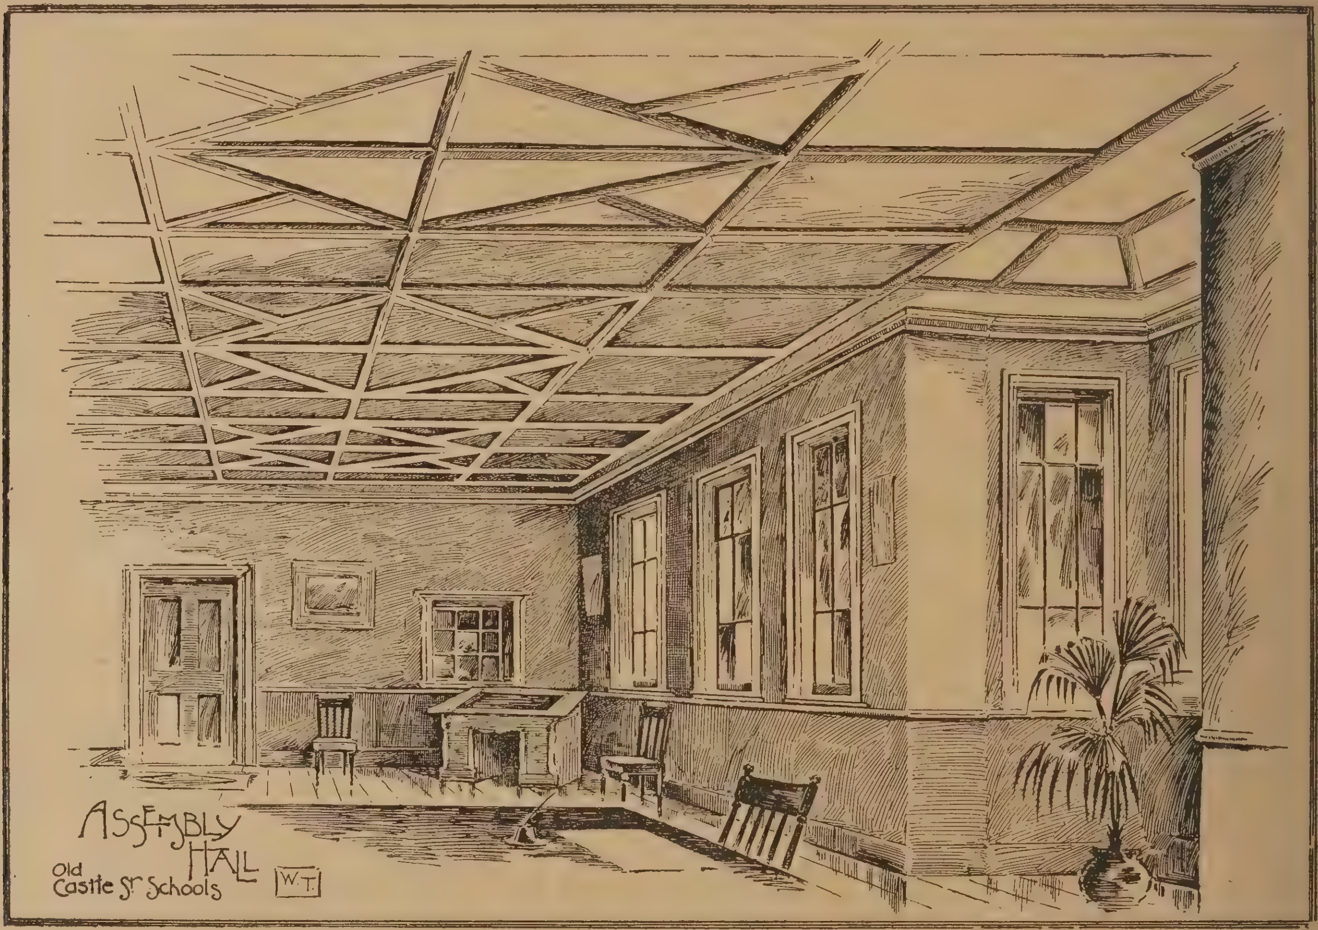
Trade and Craft.

COMPO-BOARD.

Since the last great trouble with the plasterers architects and builders are more desirous than ever of finding an efficient substitute for plaster, not only as regards effectiveness but also as regards price. Among the many various things that have been put on the market perhaps nothing has fulfilled the various claims so well as compo-board. The British Compo-Board Company, who hold the concession for the patent rights of sale for this country, did not begin to tackle the trade until they had a large quantity of material in stock at their mills, in order that they might be able to cope with the expected sale. Compo-board was practically introduced into this country at the Building Trades' Exhibition held at the Agricultural Hall last April, and already more than one million feet have been disposed of. Compo-board consists of a number of wooden slats, 4ft. long and 1in. wide, joined together by compressed damp-proof pulp boards on each side. These are set under hydraulic pressure, and when they are thoroughly dry, and have been chemically treated to make them damp-proof, a strong, stiff board is obtained, 4ft. wide and of any length up to 18ft. Our readers will immediately see the immense advantage a board of this description has over match-boarding, lath and plaster, fibrous plaster slabs, and similar articles for ceilings and walls. It is nailed to joists and studs, and is, in fact, entirely the work of carpenters and joiners. It can be immediately papered, distempered, or painted, and wherever speed is necessary, or where, as in alterations and repairs, the client desires to carry on his ordinary business at the same time, there is no material that will more effectively put the builder in a position to comply with the demands of the situation. The price of compo-board comes out at about 1s. 6d. per square yard without fixing, but the latter charge must necessarily be very small as the board comes to hand in such big sizes.

The material has already been extensively adopted by many large corporations, such as the London School Board and various provincial school boards, railway companies, H.M. Office of Works, Royal Arsenal (Woolwich), and by most of the large builders in London and the provinces. The accompanying illustration shows one of the rooms in the board school at Old Castle Street, Whitechapel, E. The ceiling has been laid out in easy panels, and for this kind of work especially there is no material that seems to be so handy and economical as compo-board. All the big schools built since the Spring by the London School Board have most of the ceilings made with this material, a fact that bears some weight with it. Of course, the majority of all these ceilings have simply a plain straightforward surface. The boards are joined on the end-grain edge of the wood, and it is very easy to stop such joints and make them smooth and level.

The offices of the company are specially built to show the use of compo-board as applied to partition walls and plain ceilings, as well as in simple and complex panels, dado work, &c. As a first class non-conductor of sound it is freely used by the National Telephone Company for their silence rooms and telephone boxes, and also by many of the City property companies as an ideal substance for office purposes. It is also a perfect non-conductor of temperature, and as such, is probably the very best material available for lining wooden houses or iron buildings, in order to keep these warm in winter and cool in summer. For all kinds of exhibition work, obelisks, show-cards, &c., its large clear surface will recommend it, and considerable quantities have been used and may be seen at the Earl's Court Exhibition, especially in the Transvaal section, where the large columns indicating the annual output of gold are built entirely of compo-board. Go-ahead architects and builders will no doubt be glad to see such an article in the market, especially now, when large panels are so much in demand.



ASSEMBLY HALL IN BOARD SCHOOLS, OLD CASTLE STREET, WHITECHAPEL, E.

MESSRS. TALBOT AND CO., LEEDS.

Messrs. Talbot and Co., glass stainers and merchants, of Leeds Bridge, have for some time felt the inconvenience arising from premises inadequate for their growing business; but steps have now been taken which at once remedy matters. The premises in the main thoroughfare at Leeds Bridge are retained, so far as the front is concerned, as a show-room, &c.; but fresh accommodation has been found in a street close by which possesses the additional feature of wharfage. There is also plenty of ground upon which fresh buildings may be erected when necessary. The premises have been fitted up and adapted so as to provide in a most complete manner for every department of the business. On the ground floor there is a warehouse room for the storage of a large quantity of glass, and on the same floor is the embossing department, where ordinary, French, and shaded glass is worked. There are also special facilities for loading under cover, with proper crane accommodation, &c. The patent gas glass-bending kilns are, however, the chief feature. These are thoroughly up-to-date, and enable plates to be bent at very short notice. The kilns are used for staining as well as for bending. The buildings include art studios, where the designs are produced, and where, at the time of the recent visit of our representative, there were windows in hand for several well-known churches in various parts of the country. Wrought iron and gun-metal casements are made on the premises. Messrs. Talbot are certainly to be congratulated upon having made such ample provision for the execution of their ever-increasing business.

VENTILATING AND HEATING.

It is a sign of the times that manufacturers and dealers are now beginning to wake up from their prosy state of conventionality, and to make their catalogues a little more interesting than hitherto. There is certainly nothing to be lost in supplementing the illustrations of goods with a readable description of them, and it is therefore with pleasure that we have to refer to the catalogue of Mr. R. W. Boyd, of 105, New Bond Street, London, W. It is a good recommendation to state that this business has been in existence for 100 years. The information in the catalogue is given under the title, "Suggestions as to Ventilating and Warming as Applied to Churches, Schools, Hospitals, Prisons, and Private Houses," and is very clearly set forth. "Common-Sense" wall and roof ventilators are shown, and directly following is a very interesting outline history of artificial warming. The "indirect" method of warming buildings, which consists in developing the heat at one point and distributing it away from the source of power, was adopted by the Romans more than a thousand years ago. It may now be generally classified under seven heads:—Hot water (low pressure); hot water (with a downward circulation); hot air; hot air and hot water combined; hot water (high pressure); steam; and electricity. All these are described and illustrated in the catalogue, which should thus be found very useful. A few of the illustrations are coloured with red and blue, indicating respectively warm and cold air. All kinds of radiators are shown, some of which are very attractive in appearance. Among the boilers there is an independent cylindrical boiler surrounded by its own flues that uses the furnace heat both inside and outside the water-jacket. Great economy of heat is thus effected. As we have already said, the book is well got up and the matter pleasingly dealt with, merits which it is certainly desirable that more catalogues should possess.

For stealing a bricklayer's tools, valued in all at 14s. 10d., a labourer named Mills was recently fined 20s. at Norwich.

Expansion of Girders under Fire.—In connection with the recent big fire at Messrs. Avery's Birmingham premises it has been stated that very soon after the outbreak the iron girders expanded and twisted, and forced out the walls of the building.

Breach of Building By-laws.—At the Ossett Borough Court last week, Messrs. Mitchell and Co., woollen manufacturers, of Ossett, and Mr. G. W. Oldroyd, builder and contractor, were fined 5s. and 20s. respectively, with costs, for a breach of the building by-laws in failing to give notice and to submit plans of a new storey added to a building.

Builders' Notes.

A Year's Building in Leeds.—During the twelve months ending October 13th, 2,607 sets of plans have been dealt with by the Building Plans Committee of the Leeds Corporation, as compared with about 2,000 for the previous year.

The Building Trade in Douglas, Isle of Man, promises to be brisk during the coming winter. The enlargement of the Grand Theatre will, it is stated, shortly be commenced, and the conversion of the pavilion into a theatre is already in progress. It is more than probable that Falcon Cliff Hotel will be converted into a first-class hydro, with the addition of over 100 bed, recreation, and other rooms. Building on the Falcon Cliff estate is now going on, and there is considerable likelihood of a woollen cloth manufactory, and perhaps a paper mill, being erected on the Belle Vue estate, near Douglas.

London County Council.—At the meeting of the Council on October 24th it was decided to clear away the slums in St. Luke's, Holborn, Clerkenwell, Southwark, and Poplar. The cost will be more than half a million. In bringing up the report, Sir J. Dickson-Poynder, M.P., chairman of the Housing Committee, said that since March 31st five large buildings had been completed in different parts of London, that another five would be ready for occupation within the next two or three months, and that twelve other blocks were now in the hands of the contractors and the Works Department, and would be finished in about a year and a half. The great Westminster improvement scheme, particulars of which are given in another column, was adopted. Reports were presented with reference to two historic houses—No. 17, Fleet Street, known as "Wolsey's Palace," and "Rutty's House," Bromley. The report dealing with the former, in which the opinion was expressed that the Council would not be justified in buying it, was withdrawn. A good deal of discussion took place with regard to "Rutty's House," and it was eventually decided to refer the matter back. The Theatres and Music Halls Committee required some alterations (which were agreed to) with regard to a new hall to the Great Eastern Hotel, Liverpool Street. This will have a frontage of 120ft. to Bishopsgate Street, and 160ft. to the drive to Liverpool Street Station, and will accommodate 700 persons.

Contractor v. Sub-contractor.—At the Nottingham County Court last week, before his Honour Judge Masterman, J.P., D.C.L., a case was decided in which Mary Ann Brady, the widow of James Arthur Brady, sued for compensation for the death of the deceased, who was accidently killed on June 29th while at work on a building in course of construction for Messrs. Barker, furniture dealers, of Angel Row. A hoist which was being used on the building for the purpose of taking up slates had on it a receptacle for holding the slates, and by some means or other this fell on Brady and killed him. The main facts of the case were not disputed, but the question to be decided was as to who was liable for the compensation, Messrs. Cooper and Crane, the builders, or Mr. A. Wright, of Greyfriar Gate, the sub-contractor for the slating. Messrs. Cooper and Crane had taken the contract to erect this building, but the deceased was employed and paid by the slater. Messrs. Cooper and Crane contended that the deceased was not employed by them in any part of their business, and that Mr. Wright was not a sub-contractor for any part of their regular work, but for work which was incidental; while on the other hand, Mr. Wright contended that he was not the undertaker of any work to which the Workmen's Compensation Act applied. It was contended for the plaintiff that it could not have been the intention of the Legislature that a contractor should be allowed to sub-let an integral portion of a building to a man who, in some cases, might not be worth twopence, and that then, if a workman was injured, he should only be able to claim against the sub-contractor. What the Court had to decide in this instance, however, was whether slating or tiling constituted an ordinary part of the trade of a builder or contractor; if it was held not to do so it would rob men of compensation.—His Honour was of opinion that in this case the work of slating was a part of the trade or business carried on by the contractor, and he felt confident that Messrs. Cooper and Crane were liable. He therefore found for the applicant for the amount claimed, as against Messrs. Cooper and Crane, viz., £217 8s. 6d., being the deceased's wages for three years at the rate of £1 7s. 10½d. per week.—On the question of indemnity by the sub-contractor the judge reserved his award.

Electric Light at the Stoke-on-Trent Workhouse.—It has been decided to make application to the Local Government Board for power to borrow £6,550 for laying down electric lighting plant at the workhouse.

The Institution of Mechanical Engineers held a general meeting on Friday last, when a paper was read on "The Incrustation of Pipes at the Torquay Waterworks," by Mr. William Ingham, engineer for that borough. Sir William H. White, the president, was in the chair.

Property and Land Sales.

FREEHOLD BUILDING LAND for SALE at Basingstoke; about 20 acres possessing a frontage of 1,400ft. to main road, and within ten minutes' walk of centre of the rising town of Basingstoke; gas and water; small villa residences in great demand; splendid investment.—T. J. Edney, Winchester-street, Basingstoke. 1

SALE DAYS for the Year 1899.
Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Nov. 16 | Thursday, Dec. 7
Thursday, Nov. 23 | Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By EDWIN FOX and BOUSFIELD.
At the Auction Mart,
On WEDNESDAY, NOVEMBER 8th, at TWO o'clock, in Two Lots.
(By Order of the Trustee of the Rev. L. A. Sharpe, deceased.)

ST. GEORGE'S-IN-THE-EAST.—A Capital, Compact, FREEHOLD ESTATE, for investment or development, well situate just off the Commercial-road, and close to the London Docks, covering one acre, or thereabouts, with extensive frontages to James, Samuel, William, and Langdale streets, and is available for the erection of blocks of warehouses or dwellings. The site is at present occupied by sixty-four houses, workshops, and beerhouse, let on leases expiring Christmas, 1899, and Lady-day, 1901, at ground-rents amounting to £147 5s. per annum, with reversion at the expiration thereof, in less than two years, to the rack-rents estimated at about £1,600 per annum.

Particulars at the Mart; of Messrs Morrell and Son, Solicitors, Oxford; and Messrs. Paines, Blyth, and Huxtable, Solicitors, No. 14, St. Helen's-place, E.C.; and at Messrs. Edwin Fox and Bousfield's Office, 99, Gresham-street, Bank, E.C.

Very Valuable Building Site, having the large area of 2,285ft. super, now occupied by No. 64, Leadenhall-street, in the CITY of LONDON, on the south side of the thoroughfare, and a few doors only from the important junction of Leadenhall with Fenchurch-street and Aldgate; highly suitable for the erection of block of offices, for which there is a demand in the locality, situate as the property is near to the shipping markets and the new centre now being formed by Lloyd's-avenue.

MESSRS. JONES, LANG, and CO. have been instructed to LET by AUCTION the above very valuable BUILDING SITE on FRIDAY, NOVEMBER 3rd, 1899, at TWO o'clock, at the AUCTION MART, Tokenhouse-yard, E.C.

Particulars, with condition of letting and plans, can be had of Henry I. Coburn, Esq., Solicitor, 54, Leadenhall-street, E.C.; or of the Auctioneers, 3, King-street, Cheapside, E.C., or at their Branch Office, 95, Leadenhall-street, E.C. Telegraphic Address, "Wonderment," London.

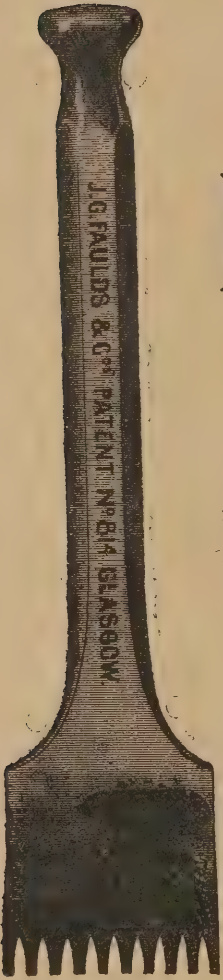
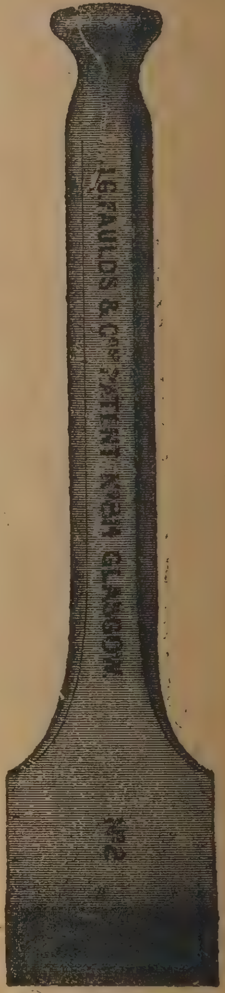
By Royal Letters Patent No. 814.

TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.



J.G.FAULDS & Cº PATENT Nº814 GLASGOW

[illegible] Drove, showing Cutter in Slot.



J.G.FAULDS & Cº PATENT Nº814 GLASGOW
Nº2

Reversible Cutter, with "Drove" Edge out.

J. G. FAULDS'

IMPROVED

Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

J. G. FAULDS & CO.,

48, NORTH FREDERICK STREET, GLASGOW, N.B.

Double Toothed Cutter.

Single Toothed Cutter, with "Toothed" Edge out.

Reversible Cutter, with "Drove" Edge out.

Reversible Cutter, with "Toothed" Edge out.

N.B.—Like every other useful invention, this is imitated, but none are genuine except

FAULDS' PATENT IMPROVED MULTIPLEX STONE-CUTTER,

and the name "FAULDS' PATENT" is on every Label.

SIR ARTHUR BLOMFIELD.

AN APPRECIATION BY WILLIAM A. PITE, F.R.I.B.A.

THE sudden and tragic passing away of Sir Arthur Blomfield while playing a game of billiards with a brother architect on Monday evening in last week at the Royal Societies Club makes a gap in the profession which cannot but be deplored. His death removes one of the few remaining links with the Gothic revivalists we have left, and his executed works exhibit a sincere and lifelong devotion to the mediæval tradition and precedent which the survivors of that school would say could not be bettered.

Arthur Blomfield was a son of a former Bishop of London, and was born at Fulham Palace in 1829. Educated at Rugby under Tait, he passed to Trinity College, Cambridge, where he graduated B.A. in 1851, and with this good groundwork he entered the office of the late Mr. P. C. Hardwick, of Cavendish Square, as pupil, where he remained for two years. There he had as colleagues, among others, T. Roger Smith, S. J. Nichol, C. L. Eastlake, F. Pepys Cockerell, and C. Forster Hayward.

Mr. Hardwick placed young Blomfield in a room alone, and he rather isolated himself from his colleagues at the outset of his career, but they apparently soon fished him out of his immolation into the general office, nicknaming him the Bishop, and then the general characteristics of the man displayed themselves, and many are the amusing stories of practical joking and skylarking, a mitre by his admiring friends making constant appearance on anything he did.

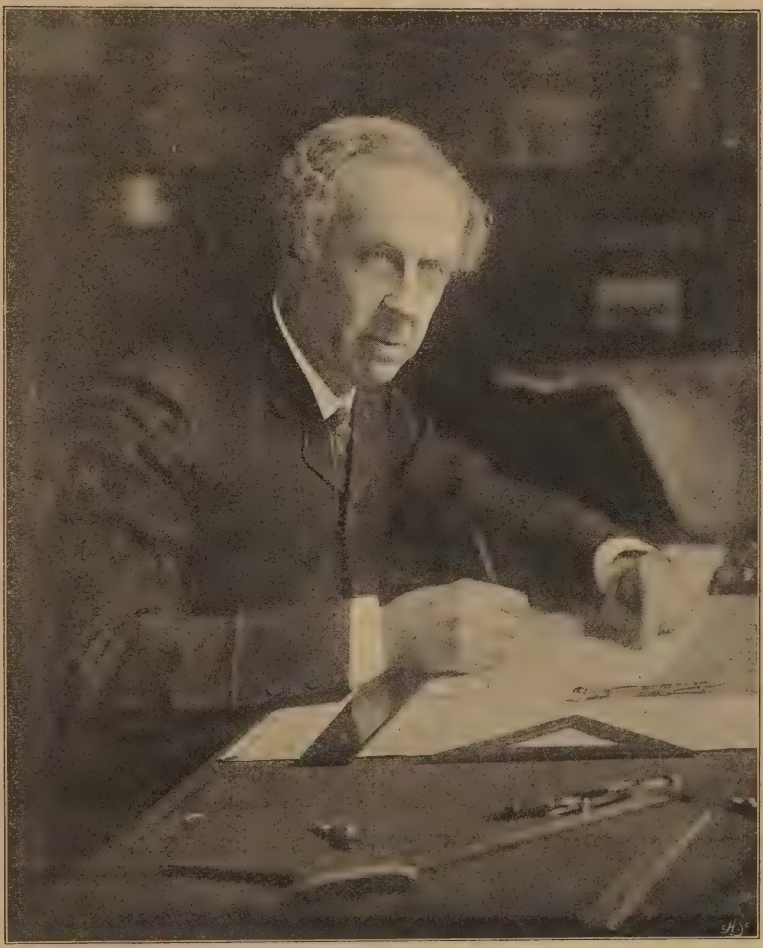
Mr. Hardwick's staff at this time seem to have been endowed with gifts besides those of architecture, for they blossomed out into office doggerel, of which some examples are still extant. The gifted Charles Eastlake, the author of "A History of the Gothic Revival," wrote the following lines concerning Blomfield nearly fifty years ago. They are so prophetic of the coming man and so characteristic withal, that they may well be quoted—

> Imprimus Bromlake,
> Be more industrious for success you'll find
> When energy with talent is combined.

These two needful elements were distinctive marks of Blomfield from the first, until he laid his pencil down last week.

Work he did! and with enthusiasm. After spending, as he said, "two years inking in Nichol's drawings," he left Mr. Hardwick's and departed on his travels with Cockerell. His draughtsmanship of that date, in sketching, exhibit light, delicate and careful treatment. No doubt he got much assistance from his instruction in drawing under Mr. J. D. Harding, while it is known that Mr. H. W. Brewer was a visitor to the office. His first work, that of St. Paul's, Haggerstone, was given to him by Mr. Hardwick, who somehow did not want the commission; however, what difficulties there were, Blomfield overcame, and with this start and with the valuable connection which a son of a Bishop of London must have, and by dint of laborious personal effort, from his office on Adelphi Terrace he firmly laid the foundation of one of the most successful practices of modern times. Firmly established, his success was now secure; and the long list of his works testifies to a life of enthusiasm for his art and of much usefulness to the community at large.

As time went on, honours and distinction crowded upon him, but none of these varied his distinctive modesty and natural charm of manner. It was his good fortune to receive many marks of Royal favour; he was the recipient of the Order of the Danebrog from the King of Denmark when the Prince and Princess of Wales opened the English church of St. Alban at Copenhagen; he was the architect also of the Duke of Albany Memorial Church at Cannes, and worked for the Prince of Wales at Sandringham. In 1889, on the opening of his additions to Eton College, he received from Her Majesty the distinction of knighthood; but no honour was probably more valued by Sir Arthur than the Royal Gold Medal, the Queen's gift, which he received in 1891, and for which he was recommended by the universal goodwill of his colleagues at the Royal Institute of British Architects.



Photographed by Ralph W. Robinson Redhill, and Guildford.

THE LATE SIR ARTHUR W. BLOMFIELD.

This is neither the time nor the opportunity for critically examining Sir Arthur Blomfield's executed works; that time will lay a kindly hand on them, and that they will never be devoid of interest we are not afraid to affirm; and his many works, spread over as they are in every part of the country, will remain an abiding monument to a distinguished architect.

Sir Arthur Blomfield has seemed to me to always convey the impression of real thoroughness. While not affecting in any degree to be original in conception, inspired by the traditions of the Gothic Revival, his hold on that method never slackened, while he was thoroughly conversant with its difficulties and limitations. Essentially an Ecclesiastical architect, his work generally had this *motif* feeling imparted, whether he had ample means at his disposal or a cheap church to build; in the latter case he was generally very happy in his results. He was a very rapid worker and has been known to bring complete sketches of a church, ready for working out, to the office, between the interval from Saturday to Monday.

When any man is removed from the scene of human activity, there is generally some one man upon whom his mantle falls. This was essentially the case with Sir G. G. Scott, G. E. Street, and J. L. Pearson, and some of their well-known Ecclesiastical appointments deservedly fell to the lot of Sir Arthur, and to the chapters of several cathedrals and many less important structures he was the professional mentor.

It would be impossible to touch upon all Sir Arthur Blomfield's work; perhaps the most important is the rebuilding of St. Saviour's, Southwark. The many problems which this must have presented, may have seemed insuperable to success, but that a remarkable work is the outcome, nobody will deny, notwithstanding the fact that it does not carry with it that creative individualism which it would have received at the hands of other distinguished members of the same school.

Nobody but those who knew the late nave can appreciate the transformation which has been accomplished, and were there no record of what has taken place, the antiquary of the twenty-third century might find himself in a hopeless fog of facts.

Sir Arthur Blomfield seems to have been devoted to a phase of Perpendicular architecture which would not have been favoured by the early Revivalists, such as that, for instance, employed in Sion College, the Church House, and the little church in Great Marlborough Street. Work of this class has always seemed to me to be a pleasant echo of his master's Lincoln's Inn Buildings, which, although out of the office when Blomfield was at Cavendish Square, has remained one of the most deservedly admired products of that interesting epoch.

Blomfield was most successful with what must be designated as cheap churches—of these we may mention, for example, St. John's, Wilton Road, Pimlico, a fine dignified interior, mainly of brick, but admirably treated both in proportion and effect. St Peter's, Eton Square, to which St. John's is parochially attached, is an excellent example of his dexterity and skill in remodelling an existing building. He is understood to have looked upon Holy Trinity, Privett, as one of his most satisfactory works.

Although an ardent Gothicist, Sir Arthur has carried out Renaissance work in churches and secular buildings. It has been said that the man of Gothic training makes the best Classicist; be that as it may, it is not for me to say if this precept applies to Sir Arthur beyond to point out the broadness of the interests of the man. His facile pencil is fully in evidence in all his works, and there is an evenness and uniformity which impresses the fact that everything he did and undertook was his own, and not another's. In all his work there was a fine sense of detail, in many cases of a very refined character.

Sir Arthur Blomfield's name figured as the first in that remarkable manifesto to the "Times," in 1891, on "Architecture, a Profession or an Art," but he never followed it up, as some of the other able and amiable enthusiasts did, by emphasizing his protest in resigning his membership of the Royal Institute, which was not only a wise, but a far-seeing discretion. It is said that long standing devotion to certain social engagements to which he had become devoted, and which he was unwilling to relinquish for a time, alone prevented him from accepting the presidential chair at the Institute, but that he was warmly interested in every movement was clear. Only recently, at inconvenience to himself, he made time to attend and take part in the opening of the last building exhibition.

Sir Arthur was ever the friend of young men, and whether in his office or at the Academy Schools he was glad to be a young man himself, and his buoyancy of spirit testified to the spirit he imparted to those around him. Amongst many men who have either been his pupils—of whom he had many—or who have assisted him, may be named Frank T. Baggallay, T. Howard Ince, Fairfax B. Wade, and Geo. Washington Brown. His influence on men was very great, and will follow him, and can be summed up in the truism that what is worth doing at all is worth being thoroughly and well done to the best of our several gifts.

This brief and inadequate notice of a remarkable career too soon ended, may well be concluded in his own words which were true of Sir Arthur Blomfield to the end; speaking at the Royal Institute in June, 1891, after he had received the Royal Gold Medal, he said:—

"I do not hesitate to confess that I shall always be a student so long as I can hold a pencil or read a book, for I hold very strongly that the education of an architect is never complete, and when he feels it to be complete (if he ever does so) it is high time for him to be laid on the shelf. When I was a young architectural student, walking one day up Ludgate Hill, I met Professor Cockerell coming down. He stopped and greeted me in his usual kind and courtly manner, and laying his hand on my arm he said: 'Blomfield, when I look at that magnificent conception, and buildings such as that, I say to myself the men who could do work like that were giants; and what are we? Pigmies.' He said no more and walked on. But those words, coming from so eminent a man and so great an artist as Professor Cockerell struck me as very remarkable, and I have never forgotten them."

On Reflection.

The Cromwell Statue. IT might be supposed that, after a man had been dead a few hundred years and public feeling had cooled down, it would be possible to form a just and correct estimate of his life and works. Such, however, is not the case with Oliver Cromwell, whom some exalt to the skies, while others are very dubious as to his merits. Periodically he comes up for discussion; the most recent instance being in connection with his statue at Westminster, an illustration of which is given on one of our inset pages. Though Cromwell may be admired by many architects and artists, it can hardly be doubted that the men of the Commonwealth will always be regarded as foes to architecture and art, for it was due to their ruthless iconoclasm that many objects and buildings of beauty, interest, and worth, were destroyed. Still, of course, the Protector cannot be held responsible for all the extravagances and acts of vandalism of his followers. The statue which Lord Rosebery is to unveil next week is of bronze, and may be considered as one of the best works of Mr. W. Hamo Thornycroft, R.A. It faithfully reproduces the chief features in Cromwell's character—solidity and bravery—and is thoroughly natural. The Bible is held in one hand and the sword in the other, and the head of the figure is uncovered; the sword point enters the hard, rocky ground at his feet. The site chosen for the statue is in keeping with the statue itself, being solitary and severe, and Oliver stands with his back to Westminster Hall, where, at his command, Charles was sent to be tried. The statue has been erected at the cost of a person who wishes to remain anonymous, but who, however, is perfectly well known as the donor. Portland stone has been used for the pedestal, which is in the later Renaissance style, and is about 12ft. high, standing on a massive base also of Portland stone. This height of the pedestal was necessary in order to raise the statue (which itself is 10ft. high) from the sunken garden in which it is placed, so that it might be viewed at its best. At the base of the pedestal there is a bronze lion with the head erect and alert. Mr. Thornycroft worked chiefly from the drawing by Mr. Samuel Cooper, now at Sydney Sussex College, Cambridge, which is the basis of most of the best portraits; numerous other portraits, in the British Museum and elsewhere, have also been studied, with a result which, in our opinion, is highly satisfactory and pleasing.

Temple Building. A BRITISH Imperial policy must necessarily always be the cause of fierce controversy, but, putting aside political considerations, the professional man must not lose sight of the fact that it may at one time or other enable him to do something quite unconventional. This is what it has done for Mr. Donnan, an engineer of Mandalay, who recently built, aided by native workmen, a Buddhist temple for a Board of Burmese trustees. Some years ago, in the reign of the good King Theebaw, who kept rubies and emeralds in barrels in his palace, the wooden pagoda which sheltered the colossal statue of Buddha at Mandalay was burned. The statue itself, although so heated that streams of melted gold ran from its surface, was saved, through the heroism of the townspeople and the palace officials. Soon after this, we British, who had long disapproved of King Theebaw's conduct, made a descent upon him, killed a large number of his subjects, stole his rubies and emeralds, and, incidentally, annexed his kingdom to our Indian possessions. Under our rule the city of Mandalay prospered, and the pious inhabitants found themselves at last in a position to re-house their miraculous statue, which, according to their legends, had received from the breath of Buddha himself the power of walking and talking. After a long discussion it was decided, on the advice of English engineers, to construct the new temple of masonry, and Mr. Hoyne Fox, a professional architect and Government engineer at Rangoon prepared a design, which was approved and carried out under the supervision of Mr. Donnan. The design, in the traditional Burmese style, was cleverly rendered in masonry by Mr. Fox and carried out apparently with great skill; the stagings being erected over the head of the statue, which it would, of course, have been sacrilegious to disturb. This circumstance caused a little embarrassment. The barefooted native workmen found that the lime mortar burned their feet as they walked over the masonry, and put on slippers to protect themselves. Some priests noticed this, and denounced the disrespect to the god involved in wearing shoes over his head: but after a strike had lasted for three weeks the priests withdrew their objection. As the building approached completion, astrologers were consulted in regard to the selection of an auspicious day for the raising of the finial,—a step which, in the building of pagodas, is celebrated by a public festival. In this case, the finial consisted of seven heavy rings surmounted by a ball, and the festival continued for eight days, one ring being set each day for a week, the fixing of the ball, accompanied by a salute of fifteen guns, marking the final day. Mr. Donnan says, in the "Indian Engineer," that he had read in the Burmese records that when public works were opened an earthquake was always felt, produced by the "nats," or good spirits of Heaven, in token of their approval. Remembering this, he observed to some of the native spectators in the course of the festivities that, in order to have the celebration complete, there should be an earthquake to show the approval of the "nats." The morning after making this remark, a shock of earthquake was distinctly felt, showing that the nats like to see English engineers building heathen temples.

"'SPECIFICATION' is a splendid book."

THE LATE SIR ARTHUR BLOMFIELD.

WE regret to record the death of Sir Arthur William Blomfield, M.A., A.R.A., F.S.A., F.R.I.B.A., the distinguished ecclesiastical architect. He died quite suddenly before medical aid could reach him, on Monday night, October 30th, death being due to seizure with syncope from heart disease, while at his club.

Sir Arthur Blomfield was the fourth son of the Right Rev. Charles James Blomfield, Bishop of London from 1828 to 1857, and of Dorothy, daughter of Mr. Charles Cox, and he was the brother of Admiral Blomfield, and of the late Bishop of Colchester. He was born at Fulham Palace on March 6th, 1829, and was educated at Rugby and at Trinity College, Cambridge, graduating B.A. in 1851 and M.A. in 1854. After leaving Cambridge he entered the office of Mr. Philip Charles Hardwick, at that time architect to the Bank of England, serving his apprenticeship under him for three years. His practice as an architect began when the Gothic Revival was in full swing, and he attached himself to it throughout his career. With Pearson, Street, and Scott he may be regarded as one of the leading exponents of modern ecclesiastical Gothic, his sympathies lying with the older Gothic tradition. Just after leaving Mr. Hardwick he made a tour on the Continent with Mr. F. P. Cockerell, son of the great Professor. Sir Arthur was a man of untiring energy and power of work. He mostly worked in the Perpendicular style of Gothic, but also built in classic styles. He was a conversationalist of great charm, and was everywhere popular.

He was twice married — first to Caroline, daughter of Mr. Charles Case Smith, who died in 1882, and, secondly, to Sara Louisa, daughter of Mr. Matthew Ryan. In 1861 he became president of the Architectural Association, and was elected a Fellow of the Royal Institute of British Architects in 1867. On the death of Mr. George E. Street he completed, with Mr. A. E. Street, the New Law Courts in the Strand. In 1883 he was appointed architect to the Bank of England. In 1886 he was elected vice-president of the R.I.B.A., and held office for three years. In 1887 he designed the Church of St. Alban for the English-speaking congregation in Copenhagen, was elected an honorary member of the Danish Royal Academy of Arts, and received the Order of the Danebrog (Third Class) from the King of Denmark. In 1888 Mr. Blomfield was elected an Associate of the Royal Academy. Shortly after the opening of the new Queen's School and Lower Chapel at Eton College, which he built, by Her Majesty in 1889, he received his knighthood. The gold medal of the R.I.B.A. was conferred on him in 1891. In addition to the appointment mentioned be held that of architect to Lincoln Cathedral. He was appointed in 1899 architect to the Committee for the Restoration of Chichester Cathedral. Both these appointments were in succession to Mr. Pearson. He was also diocesan architect to Winchester Cathedral and one of the trustees of the Soane Museum. During the last few years he had taken into partnership his two sons, Mr. Charles J. Blomfield and Mr. Arthur C. Blomfield, M.A.

Sir Arthur was an excellent actor, and at one period of his life frequently took part in amateur theatricals at St. George's Hall and elsewhere, or in drawing-room entertainments of his own composition at his house in Montagu Square. In his younger days his chief recreation was in rowing.

The principal works he had in hand at the time of his death were the Church House at Westminster and the new Christ's Hospital at Horsham. The former promises to be one of his best examples in his favourite style, and of the portion already completed the roof of the great hall is a fine piece of work.

Sir Arthur carried out a very large number of restorations to old churches, and perhaps, the most interesting of these, was the rebuilding of the nave of St. Saviour's, Southwark, a description of which will be found on the next page. His most important mansion was Denton Manor in Lincolnshire, which he built for Sir William Welby Gregory, Bart. He carried out the Bancroft School at Woodford for the Drapers' Company, and the new great school and later buildings at Charterhouse, Godalming, and the new buildings for Shrewsbury School. In London he built the Law Courts Branch of the Bank of England; Sion College Library on the Thames Embankment; St. Saviour's Church in Oxford Street (1871); the Whitgift Hospital School at Croydon; the Church of St. John, Wilton Road; and the enlargement and remodelling of St. Peter's, Eaton Square.

Perhaps his church at Portsea, illustrated on this page, is his masterpiece. He did not build the tower, which is an old one. The establishment of this church was due to the generosity

ST. MARY'S CHURCH, PORTSEA. THE LATE SIR ARTHUR W. BLOMFIELD, ARCHITECT.

"Your very useful periodical, 'SPECIFICATION'"

of the late Mr. W. H. Smith, and the building shows a specimen of design unequalled by that of any of his contemporaries.

The church of St. George, at Cannes, consecrated in February 1887, was built by Sir Arthur Blomfield as a memorial of the Duke of Albany, and includes a small side chapel containing a replica of the monument by Sir Edgar Boehm, R.A., in the Memorial Chapel, at Windsor. He built the little church of St. Moritz, and, on the other side of the Atlantic, the Cathedral of St. George, at George Town, Demerara, which, owing to the nature of the soil, had to be constructed principally of timber, the whole resting on a kind of raft of concrete. The church of the Falkland Islands had to be built from materials, except the rough building stone and sand, sent out from England. He repaired and strengthened the tower and spire of Salisbury Cathedral, and carried out restoration work at Canterbury Cathedral.

Lately he had erected a school chapel at Malvern College; West End Church at Southampton; Junior School at St. Edmund's School, Canterbury; Cathedral Library and Meeting-room at Hereford; chapel at Queen Anne's School, Caversham; and a new nave and tower to Leamington Parish Church.

The funeral of Sir Arthur Blomfield took place at Broadway, Worcestershire, last Friday, at twelve o'clock. A memorial service was held at St. Mary's, Bryanston Square, at the same hour. There was a large congregation, those present including Sir John Taylor, Sir William Robinson, Sir James and Mr. Henry Blyth, the Archdeacon of Maidstone (representing the Dean and Chapter of Canterbury), Canon Duckworth, Canon Hervey, Canon Routledge, Mrs. George Blomfield and Miss Blomfield, Professor Aitchison, R.A., Mr. Ouless, R.A., Mr. Frank Dicksee, R.A., Mr. A. Parsons, A.R.A., Mr. Aston Webb, A.R.A., Mr. Kenneth Graham (secretary of the Bank of England), Mr. S. Flamank (secretary of the Corporation of the Church-house), Mr. Phené Spiers, Mr. Pinero, Mr. John Richmond, Mr. William Emerson (president of the Royal Institute of British Architects), Mr. Alexander Graham (hon. secretary of the R.I.B.A.), Mr. W. J. Locke (secretary of the R.I.B.A.), Mr. J. T. Lee, Dr. Holman, Dr. Ogle, Mr. D. Irvine (secretary of the Arts Club), Mr. C. L. Eastlake, Mr. R. Barrett, the Rev. E. Lascelles, Mr. E. H. Martineau, Mr. Royds, Mr. E. W. Mountford, Mr. Frank Pearson, Mr. Bereford Pite, Mr. G. H. Birch, Mr. E. Crofts, Mr. John Leighton, Mr. G. E. Monckton, and Mr. G. H. Fellowes Prynne (president of the Architectural Association). The service was conducted by the Archdeacon of London, assisted by the Rev. R. Dixon Box. In the course of a brief address, Archdeacon Sinclair said that Sir Arthur Blomfield stood with Ruskin, Pugin, Barry, Scott, Street and Pearson in restoring pointed or Gothic architecture as a science, with principles and laws of its own, instead of being, as it had been mainly in the hands of previous revivers, an imperfectly understood medley of beautiful details merely to be reproduced in ill-adapted imitation without system or proportion. His beautiful style was that thoroughly English one which prevailed from Edward III. to Elizabeth, though, as was shown by the church of St. Barnabas, at Oxford, he could adapt himself to any style that was chosen. Probably no architect had built or restored so many churches, and there were few countries where he had not left evidences of his taste and skill. Hundreds of beautiful churches all over the country proclaimed at once, by the purity of their style, their admirable proportions, and their adaptation to their needs, that they were the work of Blomfield. The members of his family who were mourning his loss would, at any rate, have the consolation of knowing that their sorrow was shared by all who knew Arthur Blomfield.

A New Liberal Club at St. Albans, recently opened, has been built by Mr. E. Dunham, of St. Albans, at a cost of about £900, from the plans and under the superintendence of Mr. S. Doddimeade Edmunds, of St. Albans, and Bow, E.

SIR A. BLOMFIELD'S WORK AT ST. SAVIOUR'S, SOUTHWARK.

By CHARLES G. HARPER.

MOST important among Sir Arthur Blomfield's later activities was his restoration of St. Saviour's, Southwark. This ancient building, formerly known as St. Mary Overie, has seen many changes since the time when it was founded as the nunnery, according to tradition, of "St. Mary of the Ferry," by the daughters of the ferryman who is said to have held the rights of the ferry across the Thames just at this spot. When the Dissolution of the monasteries came in the time of Henry the Eighth, the church belonged to an Augustinian Priory. At that period the late thirteenth century nave was vaulted in wood. A great deal was destroyed when the buildings were handed over to the Royal Commissioners, and although the people of Southwark, in their piety, leased the church from the Crown and finally purchased it outright for £800, in the days of the mercenary James the First those buildings that were not of purely ecclesiastical use were pulled down and their stones dispersed. It remained, however, for the nineteenth century to create the greatest havoc here. The Magdalen Chapel, on the south side was destroyed, and the Lady Chapel (not to be confounded with the existing Retro-choir which is sometimes given that name) was demolished about 1840 in order to make an approach to London Bridge Railway Station.

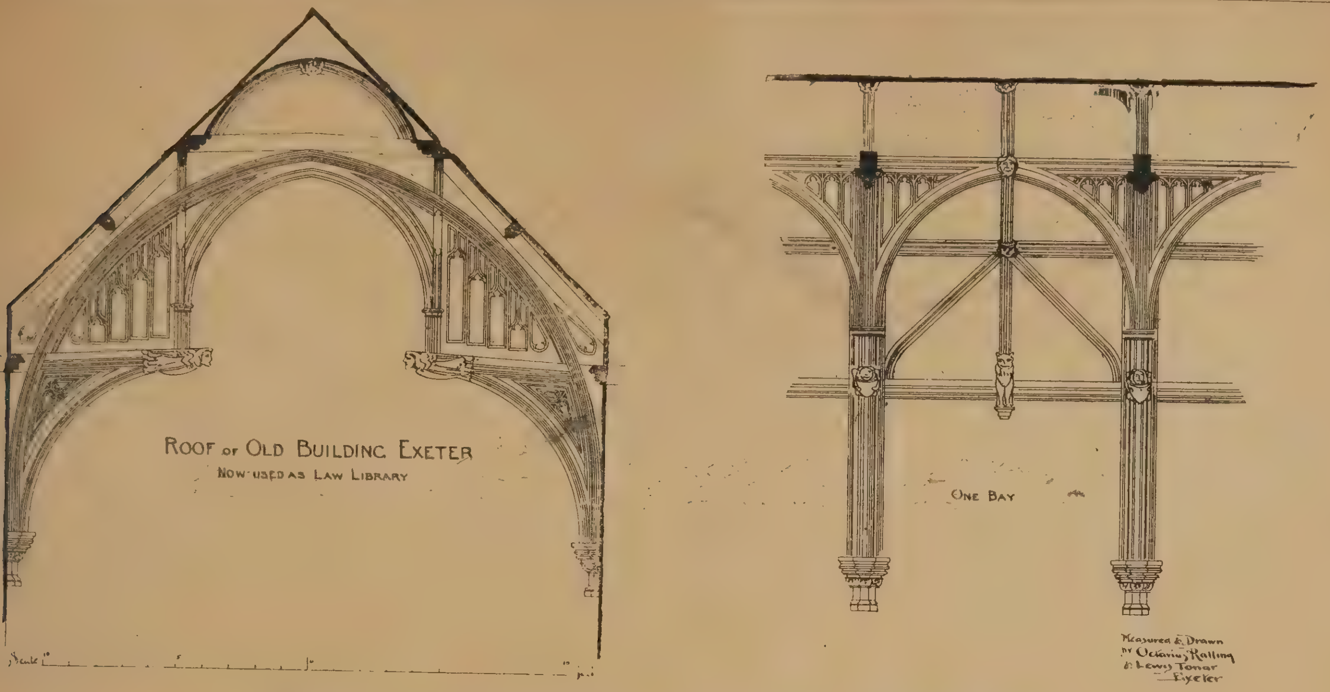
It is essential, for the proper understanding of Blomfield's work here, to know the architectural history of St. Saviour's from this time onward. No more unpromising work than this great restoration presented, nor one less thankless in these critical days, could be conceived to which to set one's hand. The very situation of the great church is unhappy. Railways, and the fruit and vegetable markets of the Borough, hem it in closely, and Barclay and Perkins' great brewery at the west end does not form an ideal landmark of a cathedral close. Despite these disadvantages, and the really terrible "restorations" at the east end by Cottingham or another early in the century, St. Saviour's is externally a noble and an imposing building, cathedral-like in dignity as well as in its cruciform plan; its central tower is a familiar feature. For nearly four centuries that tower has held this position, and in the old etchings of Hollar and his fellow antiquaries of Queen Elizabeth's time you still see it, the one great recognisable feature of Southwark.

Blomfield's work was almost wholly concerned with the rebuilding of the nave, the south transept, and the general restoration of the interior. Nearly nine and a half years ago, in July, 1890, the Prince of Wales laid the foundation stone of the new nave, and the restored, and in great measure reconstructed, church (in the meanwhile elevated to the status of a cathedral for the Suffragan Bishop of Southwark) was not reopened until February 16th, 1897. There was little or no controversy as to what should be done or what left undone in this restoration, for so greatly had the building been wrecked that the most ardent anti-restorationist could not for very shame bid the architect or the Restoration Committee stay their hands. Entering by the south porch, which is wholly Blomfield's work, one is immediately impressed by the length and beauty of his Early English nave. It may be interesting at this point to give a few comparisons of St. Saviour's with the measurements of two or three of our other cathedrals. Winchester is, of course, the largest, measuring over all from east to west 560ft. St. Saviour's measures 292ft., and thus falls little short of Rochester, which extends to 306ft. in all.

The nave consists of seven bays, rebuilt by Blomfield in that chaste and impressive Early English style, of which so few traces had been left by time, great conflagrations, and the falling of the stone vaulting in 1469, to say nothing of the wilful mutilations and the cementing of a later era. There have not been wanting those critics of Blomfield's career who have damned his work as belonging to that "old school" of Gothic revivalists whose buildings and restorations were possibly academically correct, but

DRAWN BY OCTAVIUS RALLING.

"The remarkable publication, 'SPECIFICATION.'"



ROOF OF LAW LIBRARY, EXETER. MEASURED AND DRAWN BY OCTAVIUS RALLING.

lacked the vivifying touch of enlightened sympathy. But here, at any rate, he was more than an architectural Owen, and did more than coldly reconstruct a nave from battered piers and half obliterated mouldings. In St. Saviour's nave he has made Early English to live again in fact and in feeling, and for this it is possible to forgive him his Law Courts Branch of the Bank of England, much more than we can find it in our hearts to forgive the Gothic Scott for his would-be Renaissance Government buildings in Whitehall, although, to be sure, the style of that Bank plumbs a deeper depth than that of those buildings, just as Blomfield's supple Gothic reaches a higher pitch of artistry than Scott's unvarying formula in that *genre.*

It is not often given to a man to be personal in a restoration, and yet to satisfy the critics. This is rightly so; for to set one's own stamp upon a pure restoration can readily be argued as an artistic and an archæological crime. Here, however, in the actual amount of reconstruction to be done in the nave, Blomfield is justified in the personal touch traceable. It is essentially a cheerful nave, and exquisitely proportioned and well lighted; the stone of piers and walls a warm cream colour, and the entirely new vaulting banded in cream and brown. This vaulting takes the place of a flat, wooden churchwarden's ceiling, which replaced the rotted fifteenth-century oaken vault. Ploughshare soffits give individuality, placed beside the clerestory windows. The present level of the nave floor is about a foot lower than before the restoration, and is laid with wood blocks. To those who knew St. Saviour's before these works the change is marvellous. £60,000 were expended upon them. With the floor and the transepts we have not so much concern in this place; it is the nave and the south porch that will remain as monuments of a great architect.

Bassalleg Church, Mon.—New boundary walls of red Risca and grey Forest stone, with ornamental wrought-iron railings and teak lych gates, are being erected round the churchyard of this interesting old church. The work is being carried out by Messrs. S. Shepton and Son, under the superintendence of Mr. C. B. Fowler; both of Cardiff.

A New Stand at Parkhead, Glasgow, which has been built for the Celtic Club at a cost of about £6,600, is 70yds. long, 46ft. deep, and has seating accommodation for 2,000. The seats are tip-up chairs, upholstered in green leather. In front the stand is fitted with glass windows, which can be raised at will, and so make the structure entirely open.

OLD EXETER.

ANYONE knowing Exeter is familiar with the picturesque buildings forming the Cathedral Close, varied as they are in style and character. The least pretentious externally are those shown in the accompanying sketches by Mr. Octavius Ralling, but they are, perhaps, the most interesting of all. One is the former residence of several of the old bishops, including bishops Oldham, Fox, and Courtenay, who have left emblems of their occupation in external or internal heraldic shields. The courtyard and entrance is one of the beauty spots of the city. Behind another of the buildings is a very fine old hall, now used as the Law Library, with a richly carved open-timber roof. This was probably used as the refectory of one of the monastic bodies. The house in Tudor Street is remarkable for the ornamental portion of the front of cut state hanging, the circles being filled with shields, fleur de lis, &c.

Professor Herkomer has had conferred on him the Knights' Cross of the Bavarian Order of Merit.

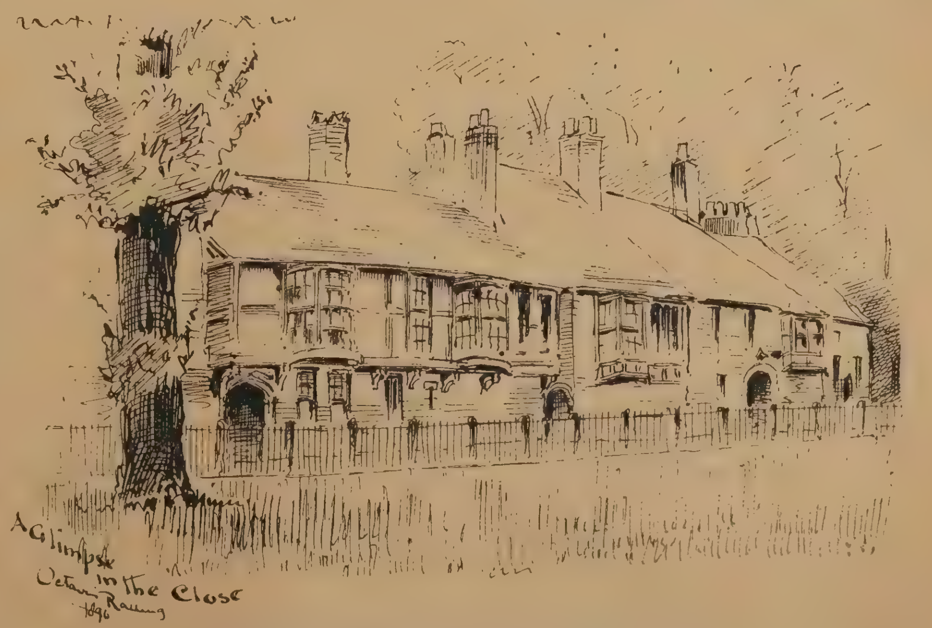
THE ARTS AND CRAFTS MOVEMENT.

By WALTER CRANE.

LAST Thursday evening at the New Gallery, Regent Street, W., the first of a series of lectures by members of the Arts and Crafts Exhibition Society was given by Mr. Walter Crane, president of the society, on "The Arts and Crafts Movement: its general tendency and possible outcome."

Mr. Crane, in opening his remarks, said it seemed a somewhat strange thing that the last quarter of this century, so progressive in the invention of machinery, should be characterized by a revival of the handicrafts. If all the epochs when such revivals had occurred were considered, it would be found that they were a natural outcome of the state of the public mind, and he thought that the present revival was no exception to this general rule. He would, therefore, look back on the movement as well as forward.

Standing upon our imaginary mountains and noting here and there significant land-



IN THE CLOSE, EXETER. DRAWN BY OCTAVIUS RALLING.

"The work will be found of great value."

marks which declared the way we had come, we saw many of the old traditions of the last century carried on into the present one; classical taste dominated our Architecture, striving hard to become domesticated, and sometimes looking dull. This gradually wore off when the middle of the century was reached; for instance, the simple old Chippendale furniture gave place to Ormolu and French glasses, &c.

The new naturalism then began to assert itself in all sorts of form, but industrial Art remained in the same state, things being done in the ordinary course of trade without anyone bothering about them. There was, however, at this time, one artist—Alfred Stevens—who spent his energies on domestic articles. This movement was mainly a sculptors' and modellers' movement and represented the naturalistic and Renaissance revival. Many and mixed elements contributed to the change, which might be traced to modes of thought which found expression in literature and poetry. William Morris appeared on the scene and the group of artists associated with him marked an epoch in England. The writings of Scott fostered quite a different kind of sentiment which had its use in keeping alive the interest in industrial life of olden days. He would not do more than mention the Gothic Revival in Architecture, as this subject would be dealt with in a later lecture of the series by Mr. Halsey Ricardo. The Gothic revival was an important point in this development of taste.

All these movements should be considered as so many streams which carried us on to the present revival of handicraft and design. Mr. H. Wilson would deal with the Pre-Raphaelite school in relation to the revival, and he (the speaker) would therefore not go into it further. Ruskin's writing was another great impulse, springing from his enthusiasm for truer ideals of Art and the study of Nature, which he so eloquently expressed. Despite all contradictions, mistakes even, Mr. Crane thought everyone who had come under Mr. Ruskin's influence would acknowledge the large part he played. It was a wholesome and stimulating influence, and should not be discountenanced by the mistakes he made, which, after all, were attributes of genius.

The initiation of the present revival was due to these many movements. One of the first in the revival was William Morris, who established his firm, the original idea of which was to give good furniture to the friends of the members, although the field of operations was extended later. Philip Webb helped in the movement, but his work was little known to the general public owing to its being mostly in private residences.

The publication of books dealing with many phrases of art and craft, while the treasures of the British Museum were opened to those who wished to really know what mediæval book-craft was like, helped to prepare the way for new ideas in craftsmanship. Associations were formed among artists for the discussion of such subjects; and among those intimately connected were also the architects Welby Pugin, William Burges, and Butterfield, who were fully alive to the value of the study of mediæval Art. Mr. Norman Shaw's work came later, and was more intimately connected with the movement, which owed so much to Architecture. Decorative artists may be said to have had nowhere to lay their heads, and so they laid their heads together. Mr. Lewis Day's society was absorbed into the Art Workers' Guild, which has since thrown out another branch, the Art Students' Guild.

These societies must be counted as educational to the public, and led to the formation, among others, of the national Society for the Encouragement of the Arts, Manufactures and Commerce, which held several congresses in the provinces as a scientific body might. Members of the Arts and Crafts Exhibition Society were always connected with these bodies, and when the Royal Academy was formed to hold national exhibitions in painting, &c., and also the crafts, they gave their support. The movement attracted a large number of adherents, especially in painting. But finding that the promoters were using this institution to promote their own personal ends the support was withdrawn, and the Arts and Crafts Exhibition Society was formed. William Morris did not join the Society until the programme had been defined, and the process of evolution was slow. Premises were at first difficult to obtain, but time seemed to help, and the New Gallery was opened. Here the first exhibition was held. The members were conscious that an exhibition was a necessary evil, for fragmentary pieces of Art could not be placed in their true relation and grouping, which was, of course, everything. The idea had from the first been to give opportunity for the craftsman to exhibit his work to the public. The ideals and aims were clearly set forth in the book of essays by members of the Society, which had been published recently. They wished to give artistic credit to nameless ones, who were concealed under the name of the firm who employed them; they had, perhaps, had more difficulty in this respect than in any other, and he again appealed to employers to help.

Looking back on the general character of their exhibitions, it was interesting to note the various influences that had affected them. A man's mature work differed from his youthful work, and if this took place with the individual, how much more might it be with a group of individuals! To the superficial observer the work was apt to be labelled as all alike. In one direction richness and artistic fancy seemed to have found a new field in jewellery, and gold- and silver-smiths' work, and the art of enamelling. This might be claimed as a direct result of the revival in artistic handicrafts.

Mr. Crane had ventured to say some years ago that we must turn our craftsmen into artists and our artists into craftsmen. This had occurred, but not so much with the latter as with the former. It was to be regretted that the English workman had been taught to look upon mechanical finish as an ideal. As a class the modern workman was engaged in an industrial war to raise his standard of life, or even to keep it, and it was to be hoped that the present system of education would help him. It was a significant fact that at the Central School of Arts and Crafts, under the direction of the London County Council, the majority of instructors were members of the Arts and Crafts Society.

The organised factory and machine industry would continue to work for the million as well as for the millionaire, but it would be a great good if groups of workmen or artists could raise standards of taste through the power and influence of their work. It was always possible for a Society to narrow down or widen; and this society had determined not to have any prejudices in regard to any particular school, but to deal only with the best work. They had seen great gaps in the ranks of men of design, and they were left to carry on the twin lamp of design and handicraft. They might well be of service in their exhibitions in maintaining the highest standard of design and handicraft, and this would be their aim.

Mr. J. Cobden-Sanderson, hon. secretary of the Society, announced that during November the New Gallery would be open until eight o'clock p.m., to enable craftsmen in business during the day to attend. The admission fee after 5.30 p.m. would be reduced to 6d. The next lecture will be given by Mr. H. Wilson, who will deal with "The Pre-Raphaelite School in relation to the revival of Design and Handicraft," on next Friday evening at, 8.30 p.m., and not on Thursday as first arranged.

A New Board School in Renfrew Road. Paisley, is to be built to accommodate 1400 scholars.

The Cardiff Empire Music Hall, which was gutted by fire last week, was designed by Mr. Matcham, of Nottingham, and cost about £25,000. It had a sliding roof, there were no columns to obstruct the view of the stage, and accommodation was provided for 1000 persons. The decorations of the auditorium were in the French Renaissance.

A VANISHED PARISIAN LANDMARK.

By GEORGE C. D'ALBI.

THE Parisians who travel on the penny boats between Auteuil and the Pont d'Austerlitz will no longer have to answer the unavoidable question of the English tourists: "I beg your pardon, sir, what is that?" *That* was a somewhat sad spectacle, and the Parisian, though light hearted enough, always winced a little in answering, more or less politely, according to his humour: "*That* is the remnant of the Palace of the Cour des Comptes, a fine building in its day." "Very long ago?" the English tourist would ask, if not well versed in French history, often taking the imposing ruins for those of a Capitole or of a Royal Palace dating from the Merovingian epoch. "Not so old as that—first Empire—destroyed in 1871 by the Commune." And the Parisian would say no more to the "Engliche" for, as a matter of fact, he did not like to talk much about this dumb, reproachful testimony of national madness, which, for the last twenty-seven years, has been left before his eyes, the last amongst the edifices destroyed by the Revolution of 1871. All the others have been razed to the ground or rebuilt. This last vestige also has now disappeared, and the Chambre des Députés, after discarding many others, has sanctioned the project which was brought before the Parliament in November, 1897, by the Orleans Railway Company, to buy the site occupied by the ruins and to build there a station, which is to be completed for the opening of the Exhibition in 1900. Visitors to Paris travelling over this line will be spared the tedious and expensive cab journey from the other side of the Jardin des Plantes; they will, instead, arrive on the Quai d'Orsay, in a square occupying the space between the river Seine and the Rues de Lille, Bellechesse, and Poitiers.

The Cour des Comptes, originally intended for the Foreign Office, was commenced in 1810 under Napoleon I., who took the greatest interest in the plans which were prepared by the architect Bonnard, prix de Rome. The Emperor, who, as everyone knows, had an unusual amount of confidence in himself, and meddled in everybody's affairs, insisted on having the plans brought to him once or twice a-week, and, as the wretched Bonnard wrote to one of his friends: "The big red pencil of his Majesty makes such a network of new lines on my drawings, altering and rearranging every detail, regardless of the practicability of his ideas from an architect's point of view, that *le bon Dieu* alone knows if I shall ever be able to complete the plans." Bonnard's presentiments proved to be correct, for the fall of the Autocrat and his own death took place before the completion of the Palace. After the Restoration, and under Charles X., the work was carried on slowly and without enthusiasm by Lacornée, who was a pupil of Bonnard, and, although in 1820 a sum of 5,354,101 francs had been already spent, it was only under Louis Philippe that the work was again taken up and at last finished, in 1842, at the cost of 9,874,480 francs.

It is generally believed that the members of the Commune were the sole destroyers of the palace; but a rumour circulated after the fall of the second Empire, accusing the partisans of Napoleon III. with the crime of destroying the building, or with having excited the infuriated mob to do so, the Emperor and his principal ministers having good reasons of their own to wish for the total disappearance of some secret State papers, too well conserved there. This is the way in which the good republicans and the enemies of the Empire tell the story of the fire, but the true facts are, that Eudes, one of the generals of the Commune, and Megy, together with a few other leaders of the Revolution, decided that the building should be searched and the Imperial documents brought to light. So they arrived one morning at the gates, and forced Mr. Noel, the governor of the palace, to give up the keys of the private rooms entrusted to his care. They were, however, disappointed, and found only

"My high opinion of 'SPECIFICATION.'"

a few certificates of deaths, births, and marriages in the Imperial family, and some autograph letters of Napoleon I. The believers in the rumour explain this, by saying that Mr. Noel had foreseen the possibility of a search, and had hidden any compromising documents which he had under his charge. He remained there unmolested till May 2nd, when the military chiefs of the Revolution, seeing that resistance was impossible, and that the troops sent by Thiers from Versailles would soon be within the walls of Paris, decided to destroy the principal monuments of the Capital and leave behind them nothing but ruin and destruction. The reason of this determination is not easy for any Englishman to understand; perhaps the leaders of the Commune did understand it, but it is doubtful whether there was any other excuse, except the love of wanton destruction, so dear to the hearts of the French mobs. Nôtre Dame escaped almost by a miracle, as did the Louvre, but the Cour des Comptes burned with the Tuilleries, the Hôtel de Ville, and all the private houses of the aristocracy around them. The palace of the Légion d'Honneur was saved owing to the extreme courage of two men, who, at the risk of their lives, entered the building, already partly in flames, and rolled away the barrel of powder put there by their friends. From the Palais Royal to the Champ de Mars there was nothing to be seen but a huge blaze surrounded by a joyous mob of lawless men and women, who were only prevented from committing further excesses by the timely arrival of the troops.

No one knows the names of the men who forced the gates of the Cour des Comptes and followed Mr. Noel through the rooms and the galleries, covering him with their guns, till he was forced to leave his post of honour. Then they proceeded to smear the walls with petroleum; a barrel of powder was brought into the Great Hall, and at a given signal, blown upon a clarion, the building was set fire to and the secrets of State destroyed.

Paris did not lose a marvel of architecture, it is true; the Palace was a hopeless mixture of styles; the exterior was far from beautiful, and the interior decorations were heavy and without any character. The rooms in which, for a time, the Council of State was held, was always said to be the most striking, but the Parisians who remember the huge building say frankly that it never was so beautiful and so picturesque before it had been gutted by the explosion of 1871. The principal frontage was on the Rue de Lille, though the best known was that on the Quai d'Orsay; both were somewhat alike, and showed evident proofs of their having been built by more than one architect, and under more than one government. The columns of the *rez-de-chaussée*, which were raised about 7ft. above the ground, were of the Doric order; those of the first floor were Ionic; the ornaments of the top were pure Renaissance; and the whole to the lover of classical harmony was a simple cacophony. The entire length of the building was pierced by nineteen arches, forming both on the side of the Quai d'Orsay and the Rue de Lille, and round the large Cour d'Honneur, open loggias on the ground and first floor, giving to the building a breadth of light and shade which made it striking. In the interior of the Palace were three Cours d'Honneur, giving access to the different halls and state rooms, most of them decorated with panels of various merit. The best ones were those of the grand staircase (the work of Theodore Chassériau) which were not completely destroyed. The groups personifying Silence, Meditation, Study, War, Force—the last one being a masterpiece—consisted mostly of female figures skilfully treated.

As long as the question of the reparation of the Palace was pending, the pictures were left covered with linen and thick layers of brown paper; last year they were brought to light and found to be in a fairly good state of preservation. They are going to be removed to the Louvre galleries. In the Salle des Séances some mural decorations by Gendron, representing the hours and the principal events of human life, have been very much spoiled. Some photographers have endeavoured to reproduce a few panels that are to be kept in the National Library.

For some years before its final destruction no one except the workmen and one or two privileged artists were allowed in the ruins, on account of the increasing danger caused by the constant falling of bits of walls and half detached stones, treacherously hidden under creepers of all sorts, for during the twenty-seven years which had passed since the fire, the Palace had been left untouched, and a most copious growth of vegetation had sprung up. Mr. Vallon, the well-known botanist, counts no less than 152 kinds of plants, amongst which all sorts of animals, birds, and reptiles live. For many years a large flight of rooks built their nests in the ruins, but, together with the other noisy tenants, they have been frightened away by the gang of workmen who came every morning with picks and axes to destroy their homes. And soon a modern building, which, let us hope, will be erected with enough taste not to spoil the fine view along the shore of the Seine, will stand on the spot which was once occupied by the ruins of the Cour des Comptes.

UNDERGROUND MINES AT THE PARIS EXHIBITION.

By A. ANDERSON.

ONE of the features that will certainly attract a very large proportion of the visitors to the Paris Exhibition next year will be the series of underground mines that are to be shown in full working order, and under conditions so ultra-realistic that the spectator's illusion will be complete. Such an enterprise would never have been possible, or, at any rate, would never have been seriously entertained, had it not been that the most costly part of the work, namely, the site, was prepared more than two centuries ago, long before international exhibitions had ever been heard of.

As many people are aware, the greater part of the city of Paris was originally constructed of stone, quarried from the strata directly underlying the soil, the practice being commenced by the Romans. The seams of stone being followed up wherever they led and as long as they lasted, a very considerable depth beneath the surface was attained in many places, the ramifications of the various galleries extending in all directions. As a consequence, the Paris of to-day is almost completely undermined, the continuity of the galleries being only broken by the bed of the Seine. Were it not for this, it would be possible to pass practically from one side of the city to the other without once being compelled to come to the surface.

Many projects have been at various times mooted for making use of these excavations, but something has usually interfered with their being carried into practical effect. In the earlier half of the present century, when the old cemeteries within the precints of the city were appropriated to other purposes, the question presented itself, what was to be done with the bones that were found in the soil? It was eventually decided by the municipal authorities to place them in a portion of the old quarries. This was the origin of the so-called catacombs of Paris, well known for many years past as a popular place of pilgrimage for the tourist. With this exception the miles and miles of wide galleries may be said to have never been utilised, not, at any rate, for any legitimate purpose! The approach of the Exhibition, however, once more brought the subject on the *tapis*. It so happens that the gardens that slope down to the river from the Trocadero cover one of the most important series of quarries, or rather mines, of former days. Moreover, the Trocadero gardens form part of the area that is included within the area of next year's Exhibition grounds. This double fact was taken advantage of by the Associated Coalfields of France to elaborate a project for utilising the quarries by installing a series of mines in them. The necessary permission having been granted, M. Gruner, the secretary of the Associated Coalfields, had operations started some time ago. A shaft about 50ft. deep has been sunk, and the portions of the galleries which it is proposed to utilise are being widened and heightened to about 8ft. The works involve considerable labour, as the use of blasting powder is absolutely prohibited, principally for fear of damaging the huge superincumbent structure of the Trocadero, the foundations of which come right down into the galleries. The workmen have also come across other foundations which were intended to be those of a palace that was to have been constructed for the King of Rome at the beginning of the present century, but which was never carried to a conclusion.

The original excavators of the stone had left at intervals large square columns, untouched by the pick, to serve as supports for the rock and soil above. These are now being demolished and replaced by solidly constructed masonry. In the galleries thus enlarged, mining operations of all kinds will be shown—coal, lead, the precious metals, salt, diamonds, copper, &c.—the substances being actually mined under the eyes of the visitors by real miners, employing all the most modern tools. In another separate section of the galleries, access to which will be gained by an inclined plane instead of by a perpendicular shaft, a series of archæological reproductions are being arranged, including a mine in the time of the Phœnicians, the tomb of Agamemnon as discovered by Schliemann, a necropolis of Lower Egypt, and various other similarly interesting sights. All the galleries, both in this section and in that of the mines, will be lighted, of course, by electricity.

The construction of the surface buildings presented no little difficulty. On the one hand it was necessary to have a structure that would be conspicuous from a distance, and on the other hand it was intimated that no plans would be passed by the exhibition committee that would in any way hide or even jar with the architecture of the Trocadero Palace behind, as it is intended that this is to play a very prominent part in the festivities and fêtes of next year. M. Beigbeder, the engineer, who has charge of the works, and under whose direction everything is being carried out, had thus, of course, his hands tied in advance, and was obliged in consequence to curtail his architectural ambition. The surface buildings of a mine are not as a rule the most æsthetic-looking structures in the world, and M. Beigbeder seems, under the circumstances, to have extricated himself with a good deal of dexterity from the toils of the problem he was asked to solve. The façade of the building, thanks to the lightly constructed extraction tower that dominates it, is relieved of all heaviness of aspect, and, judging by the plans, should, when completed, prove a by no means undesirable addition, from an architectural point of veiw, to the Trocadero Gardens. Were it not for the very great slope of the gardens, M. Beigbeder would of course have been still further hampered in the matter of height. The total depth of the building is forty-five metres, or nearly 150ft., and the width seventeen metres (about 56ft.). The shaft by which visitors will descend is situated at the end of the building, and has an interior diameter of about 15ft., sufficient to permit the employment of lifts capable of carrying a very large number of people at each journey. The frontage of the building is most elaborately decorated with multi-coloured marbles and enamelled cabochons, a somewhat florid style, being not only acceptable but almost necessary in periods of popular exhibitions.

English Advertisements in the Paris Exhibition Catalogue are in the hands of Mr. C. Wilkes, of 29, Ludgate Hill, London, E.C., who has been appointed general manager and sole agent for the British Empire (except Canada) for this section. He is also the sole agent for the French and English guides and other publications issued by Messrs. Lemercier and Co., the Exhibition printers.

For other opinions see inset in this number.

Keystones.

Mr. W. H. Trood, the painter of animals, has died at Taunton from pneumonia.

An Admiral Blake Statue for Bridgewater is now in the hands of Mr. Pomeroy at Chelsea.

New Baths for Birmingham.—It is proposed to build baths in Green Lanes, Small Heath, at a cost of £30,000.

London's Three National Art Galleries will now be closed on Sundays for some months to come. The museums will remain open.

Notice of Removal.—Mr. Herbert Quinton, architect and surveyor, 15, Magdalen Street, Oxford, has removed to 22, George Street, Oxford.

The Society of Arts commences its 146th session on the 15th inst. with an address from the Chairman of the Council, Sir John Wolfe Barry.

New Organ at Cardiff.—A new organ has been placed in St. Catherine's Church, Canton. Messrs. Harrison and Harris, of Durham, were the builders.

Sites for New London Board Schools are to be purchased in Chelsea, Finsbury, Greenwich, Hackney, Lambeth, Marylebone, and Tower Hamlets.

A Morley Memorial Model School has been opened at Homerton to commemorate the lifework of the late Mr. Samuel Morley. It accommodates 240 children.

The Arts and Crafts Exhibition will now be open on Monday evenings up to eight o'clock; after half-past five the price of admission will be reduced to 6d.

The Glasgow Art Club Exhibition was opened on Saturday, and will remain open until December 9th. There are 252 works exhibited, including three pieces of sculpture.

A New Association.—At a meeting held in the Leeds Technical School on Saturday, the West Riding Association of Teachers of Science, Art, and Technology was constituted.

New Chapter House for St. Ninian's Cathedral.—On November 2nd the foundation stone was laid of the new Chapter House in connection with St. Ninian's Cathedral, Perth.

The Guildhall, Winsford, Cheshire, was opened on Saturday by Sir John Brunner, M.P., who bears the cost—£3,000. It is for the use of trade union societies and other organisations.

The Winter Art Exhibition at Bristol includes some important Belgian works. A better and more comprehensive selection of modern pictures has never been exhibited in Bristol before.

Mr. Ernest Runtz, architect, of 10, Walbrook, is preparing plans for the new Gaiety Theatre and Restaurant, and also for Messrs. Short's wine stores, that are to be erected in the new street from the Strand to Holborn.

A New Mission Church at South Tottenham has been erected at a cost of £3,000. It is 104ft. long by 34ft. wide, with nave, choir, and sacrarium, and has seating accommodation for 350 persons. A parish room and two vestries are also provided. Externally, the church is built of red brick, with Portland stone dressings.

Mr. Gladstone's Manchester Statue will be unveiled in the centre of the open space at the junction of Victoria Street and Market Street towards the close of next year. The artist, Signor Raggi, is completing the plaster cast, and in a few weeks it will be sent to the foundry of Messrs. Signer and Sons, Frome, who will cast the statue in bronze.

Another Gladstone Statue.—A statue to the late Mr. Gladstone was unveiled at Blackburn by the Earl of Aberdeen on Saturday. It has been erected at a cost of £1,800, gathered by public subscription, weighs about four tons, stands 10ft. high, and is the work of Mr. John Adams-Acton. The attitude of the figure is with hand upraised as if about to speak.

The Edinburgh Building Trades' Exchange pay a dividend of 6 per cent this year.

New Municipal Gasworks at Vienna, just opened, have been built at a cost of £3,500,000.

A New Church at Deganwy, Llandudno, has been built by Messrs. S. Parry and Sons, of Llandudno, from designs by Mr. Douglas, of Chester.

New Technical Schools at Stoke-on-Trent have been built at a cost of £3,181. The scheme includes the extension of the public baths.

Farncombe Street Board School, Bermondsey, S.E., is one of the oldest schools erected by the London School Board. New halls have recently been added.

Redditch Technical Schools. — The foundation stone of this building was laid on November 1st. Mr. H. R. Lloyd is the architect, and Mr. G. Huxley the builder.

A Municipal Crematorium at Hull is now being built at the Headon Road Cemetery, at an estimated cost of £3,168. This is the first municipal crematorium in England.

A Nurses' Home at Newcastle, in connection with the Fleming Memorial Hospital for Sick Children, has been built from designs by Messrs. Oliver, Leeson and Ward, of Newcastle.

The New University of London Hall for the science of political economy, a site for which has been provided in the new street being formed by the London County Council in Clare Market, Strand, is to be commenced at once. Mr. Maurice B. Adams, F.R.I.B.A., is the architect, and Mr. Passmore Edwards has contributed £10,000 towards the cost of the work.

New Lunatic Asylum for Aberdeen.—At a meeting of the Aberdeen City and District Lunacy Board on Thursday, it was reported that the Sites and Buildings Committee had purchased the estates of Kingseat and Rainnieshill, measuring altogether about 1,500 acres, and costing about £34,000, for the purpose of a new lunatic asylum. The committee were authorised to obtain plans for the building, and to accept tenders.

Barry, Barry Dock, or Cadoxton?—At a recent meeting of the Public Works Committee of the Barry District Council a letter was read from the Ordnance Survey Department, asking the Council to decide upon the name of the town. At present it was called either Barry, Barry Dock, Cadoxton, or Barry Island. It was unanimously agreed that as the whole of the parishes in the town had been unified under the name of Barry, the town itself should be called after that name.

The Artists' Guild.—The Queen will send the following loans from the Royal collection at Windsor to the eleventh exhibition of the Artists' Guild:—(1) Contemporary drawing of Queen Elizabeth; (2) workbox given by King Charles I. to the ladies of Little Gidding; (3) coloured prints on satin of George III. and Queen Charlotte; (4) five portraits on silver by C. de Passe. The exhibition will be opened on Tuesday, November 14th, at three o'clock, at the Royal Albert Hall, by Princess Christian, and will remain open the three following days.

A Million for Workmen's Dwellings.—At a recent meeting of the St. Pancras Vestry Mr. J. Thornley, J.P., had a resolution on the agenda paper for providing industrial dwellings in the parish, for which he proposed that a million sterling should be borrowed at 2½ per cent., equal to the erection of thirty five-storey blocks collectively accommodating 15,000 persons. At a rental of 2s. for each room he anticipated a yearly income of £39,000 to meet an expenditure of £38,000 in repayment of the loan. The Vestry acquiesced to Mr. Thornley's request that he should defer his motion to a subsequent occasion, meanwhile supplying each member with a printed explanation of his scheme, which he held to be practicable and desirable, on commercial as well as on sanitary lines.

Public Baths at Stourbridge.—It has been decided to erect public baths at Stourbridge at an estimated cost of £4,500. Mr. F. Woodward, surveyor, has prepared plans.

A Bronze Statue of Admiral Raphael Semmes, the commander of the famous "Alabama," has just been cast in America. The late Mr. Caspar Buberl, of New York. executed the work.

The Karnak Columns, which fell a short time ago on account of a slight shock of earthquake, caused damage which is estimated to cost £50,000 to repair; this amount includes the strengthening of the temple.

Old St. James's Church, Leicester, a wooden building built in 1881, is to be replaced by a new structure designed by Messrs. Goddard and Co., at an estimated cost of £10,000. The chancel and part of the nave are to be built first, at a cost of £7,856.

A New Four-light Stained Glass Window has been placed in the west end of Holy Trinity Church, Smethwick, Birmingham, in memory of the late vicar, the Rev. Thomas Ridsdel. The subject of the window is "Christ Blessing Little Children." The work is from the studios of Mr. Arthur J. Dix, 54, Berners Street, London, W.

Result of Competition.—The successful competitors for the new Masonic Hall that is to be erected in Great George Street, Leeds, are:—First, Mr. J. M. Bottomley, Middlesborough and Leeds; second, Mr. Clarence Coggin, Adelphi, London; and third, Mr. A. E. McKewan, Newhall Street, Birmingham. The assessor was Mr. J. Lane Fox, of Dewsbury.

The High Altar Screen at St. Albans Abbey has been restored at a cost of about £15,000 by Messrs. Hems, of Exeter, who were under the direction of the late Sir Arthur Blomfield. The screen itself is 42ft. high and 39ft. wide, extending from the north to the south side of the sanctuary. It is built entirely of clunch, a finely grained, white stone obtained from the quarries of Totternhoe, in Herts. The most striking feature of the screen is the great central statue representing the Crucified Christ, which is 8ft. 6in. high. An illustration of the torso appeared in the BUILDERS' JOURNAL for February 8th last.

The Czar's House in Paris. — The Emperor of Russia is not sure whether he and the Empress can attend the 1900 Exhibition, but if they do, they will be under their own roof. It is stated that an agent of the Emperor has purchased for him the oddly-planned house in the Champs Elysées, which Cubas turned for some time into a restaurant. It was built by the notorious Madame de Paiva, who wound up a stormy life by marrying a vastly rich nobleman of Silesia. The French Government has decided not to provide lodgings as well as entertainment for any of the Sovereigns coming to the exhibition. The plan, dear to the late Felix Faure, of a Guests' Palace thus falls to the ground.

Sanitary Inspectors' Association. — A meeting of the Sanitary Inspectors' Association was held on Saturday evening at the Carpenters' Hall, London Wall, to hear the inaugural address of the Chairman of the Council, Mr. W. H. Grigg, Inspector under the Food and Drugs Act for Fulham. In his address Mr. Grigg congratulated the association on the remarkable favour with which the Qualification and Tenure of Office Bill, which it had decided to submit to Parliament, had met, a success which had far exceeded his most sanguine expectations. One of the most important benefits bestowed on sanitary inspectors, should the Bill be carried through, would be that whereas at present an inspector might be dismissed at the will of local bodies, after the Bill was passed no sanitary inspector could be dismissed by any local body without the sanction of the Local Government Board. It was proposed to introduce the Bill into Parliament immediately on the reassembling of the House. Another matter for consideration was the urgent necessity of promoting the amalgamation of the Sanitary Inspectors' Associations throughout the country in order to present a united front to their enemies.

PRESIDENT'S ADDRESS.

THE inaugural sessional meeting of the Royal Institute of British Architects was held on Monday evening last at 9, Conduit Street, W., when Mr. William Emerson, the president, occupied the chair. His first duty, he said, was to announce the regretable death of Sir Arthur Blomfield. It was only a week previously that he had received a letter from Sir Arthur, in which he intimated his intention to be present at this meeting. The chairman mentioned what an ardent admirer of the old Gothic school of Architecture their deceased friend was, and said that in his works, as in his life, there was a strong element of self-restraint; they were full of quiet refinement, and were totally devoid of any form of affectation. He said it was proposed to hold at the Institute an exhibition of Sir Arthur's chief works, and he referred to the simplicity, stately dignity, and proportion of Christ Church, St. Leonards, and of the nave at St. Saviour's, Southwark (a description of the latter is given in another column). Sir Arthur Blomfield had been vice-president of the Institute from 1886 to 1889, and could have ccupied the position of president years ago had the time at his disposal allowed him to do so. He was the stamp of man produced by the old school of architecture which had now died out, and his death was a great loss both to the architectural profession generally and to the Institute. The secretary then read a translation of a letter received from M. Charles Lucas, of Paris, an honorary corresponding member of the Institute, in which admiration was expressed for the influence of Sir Arthur Blomfield, who was by everyone referred to as a thorough gentleman. It was agreed that a vote of condolence and sympathy should be sent to his wife and family.

The deaths were then announced of Mr. Thomas Elworthy, elected Fellow in 1884, and of Mr. Henry Hockey Burnell, elected Associate in 1849. The Chairman then moved that a vote of sympathy should be sent to the family of Mr. William Simpson, who had died on August 21st, and had been an old member of the Institute as an honorary associate; he was a famous Indian archæologist, and had acted as war correspondent to the "Illustrated London News." For the statutory examination held on October 26th and 27th two candidates had presented themselves, and of these Mr. C. A. Daubrey, of 1, Wellington Road, Peckham, S.E., had been granted a certificate of competency to act as district surveyor in London.

After the secretary had read the names of candidates nominated for election at the business meeting to be held on Monday, December 4th, the president delivered his opening address as follows:—

The coming session, for which I have the honour of occupying this chair, is the sixty-fifth in the annals of the Royal Institute of British Architects. It is also the last ession of the nineteenth century. In glancng at the doings of the Institute since its foundation in 1834, the thing I most keenly feel in this particular position is the exceeding difficulty and responsibility of continuing and worthily upholding the character and dignity of the work that has been achieved by my predecessors in office. I think the list of members of the Institute points to considerable and satisactory progress in its affairs since its inception. n 1837 we had ninety-six Fellows and Associates, of whom fifteen only were country members. In 1887 we had 1109 members, of hom 259 Fellows and 435 Associates were om the Metropolis, and 169 Fellows and 246 Associates from the Provinces. In 1899 since the federation of the country societies with ur London body—and this is a fact I wish to mphasize—our number has increased to 1612, f whom 290 only are Fellows from the Metropolis, while 328 are from the Provinces, and 52 London Associates, and 442 from the ountry. The number of societies in alliance ith us in England, Scotland and Ireland, and he Colonies is seventeen. These figures show that the old reproach of this Institute being merely metropolitan can no longer be cast at us, but that it has now attained a national character and influence, as much appreciated by the members of the profession in the country as in London. The work also of the Institute is increasing each year in importance, making its opinions heard and felt in respect of many important public questions relating to architecture. The conservation of our national monuments, building projects both for the Metropolis and Provinces, the laying out of new streets and town improvements, legislative acts in relation to building operations, the representation of our Institute on many public bodies and committees where questions affecting architecture or buildings may arise, the conduct of competitions, the promotion of the education of architects by annual examinations, the presentation of annual prizes and medals, are some few of the subjects constantly dealt with by the Institute.

The Influence of the Institute.

Moreover, the Government at times does not hesitate to consult us on questions connected with public works. All these are fair proofs that the sixty-five years of our existence as a Royal Society have not been altogether wasted from a public and national point of view, apart from matters more immediately connected with the interests of the profession at large, and the future of architectural development. And the extending influence of the Royal Institute of British Architects seems in no danger of languishing—if one may judge by the vivid interest taken in its working and actions by the junior members, who desire more voice in its affairs. In respect to this point I may say the Council had under deliberation at the end of last session what steps could be taken under the Charter to associate them more directly with the work of the Council. Amongst other things it was decided to remove all restrictions as to the eligibility of Associates for seats on the Council. Also, with a view to extending our sphere of influence, a congress will probably be held in London this session, and in Glasgow in 1901, at the time of the Exhibition. At certain periods in the lives of individuals it seems fit to review, with a critical eye, the actions of their past lives. So at the wane of a century notable for its progress in knowledge, culture, and civilisation, it may be opportune for us, as architects, to glance back and see if any advance has been made in our art (which the Charter asserts is esteemed and encouraged by all enlightened nations), and whether our efforts have been conducive to the benefit of mankind and the glory of our country through the part the Institute has played during the last sixty-five years in the furtherance of our national interests so far as they are affected by Architecture. There are several reasons why during this century great architectural developments might reasonably have been expected. It has, on the whole, been eminently peaceful and prosperous, which fact one would think should certainly affect all arts favourably; for rest, quiet, and prosperity seem essential to their growth. This peace and prosperity were brought about by the exhausted state of Europe at the cessation of the wars of the last century and the early years of this; by scientific inventions which developed our Empire, manufactures and commerce; and in later years by the wealth and naval supremacy of Great Britain, the knowledge of the awful effects of modern warfare, and the growth of civilisation and humanitarian sentiments. At the close of the eighteenth century and the beginning of the nineteenth, Europe had passed through a crisis unparalleled in its character and effects in history. The Seven Years' war, the wars of American Independence, and the Napoleonic wars ending in 1815 had raised our National Debt to some £900,000,000 sterling. Taxation was heavy, commerce stagnant, and there was little demand for labour. Our impoverished and tired country was eager for peace and only too glad to turn its attention to home politics and peaceful pursuits. Then the experiences of the French Revolution taught England lessons which resulted in provisions for the more direct representation of all classes of people in the government of the country, and the Commons became the people's House of Parliament. The more direct representation of the people tended to the furtherance of utilitarian and humanitarian projects. The humanitarian feeling of the age for the poorer classes was shown by the abolition of the slave trade. This feeling found further expression in such measures as the formation of new poor laws, factory legislation, school boards, prison laws, asylum boards, national training schools of Art, railway bills, building acts, and county councils. All these have in many ways provided opportunities for architects and largely affected Architecture. But in most buildings for humanitarian purposes

Architecture has been Hampered

by the many necessary laws relating to sanitary matters, such as the relation of light area to rooms, superficial floor space and cubic air space, heating, ventilation, and drainage. Whether Architecture as an art has been improved by these conditions is questionable. From the utilitarian standpoint, Committees and Boards seem universally to affect Architecture in an adverse manner; in fact æstheticism and utilitarianism appear to be always antagonistic. But surely a properly educated body of architects should be able to reconcile the two. As well as from peace and the peaceful politics of the century, an advance in Architecture might reasonably have been looked for from the influence of the increase of knowledge, our modern facilities of travel, the scientific discoveries and inventions, resulting in an enormous influx of wealth; also from archæological research, and the desire for culture, from literary and artistic productions in books, journals and publications which have educated the taste of the public and also influenced that of architects. Looking at past history, Art seems to have acquired fresh vigour and life and made greatest strides at

Periods of Learning and Culture

during years of independence and peace succeeding great wars or troublous times. These latter have often lent inspiration afterwards to architects and sculptors for the adornment of buildings, and given a living interest to their work. The comparative quiet of the fifteenth century, after the turbulent feudal ages, saw the rise of the Italian Renaissance. So, also, when the Western world settled down after the invasion of the Goths, they developed the best periods of Gothic architecture under the influence and teaching of the Holy Catholic Church. It was in the quieter years succeeding two centuries of continuous Mahomedan conquests that the stately and magnificent Architecture in Africa, Spain, and the East developed itself. After the Persian sway had been destroyed at Thermopylæ and Platea, the Parthenon and the best Greek art were produced. So, too, at Rome the finest works of the Empire were created during the period of comparative calm and prosperity that followed the subjugation of Greece. Some critics decry our present architecture, and say it often shows little taste and no advance in Art or style. But they should recollect that

The Highest Level of the Arts

of any of the periods above mentioned was not arrived at in a day, nor did their architecture leap to perfection in a decade, and certainly Architecture then could scarcely have had to fulfil the complicated requirements which make modern architectural problems so difficult. The Parthenon was erected over half a century after Platea. The best of Roman architecture was not evolved till long after the battle of Actium; nor did the best phases of Gothic architecture appear until after many centuries of patient endeavour. Also more than two centuries succeeded the rise of Mahomedanism before its literature and scientific knowledge developed, or its architecture resulted in the Mosque of Toloun; and many more passed before the erection of the tombs of the Caliphs, and before the elaborate refinements of the Alhambra and the perfect beauty of the Taj Mahal were arrived at.

(To be concluded.)

Correspondence.

LEEDS MASONIC HALL COMPETITION.

To the Editor of The Builders' Journal.

London, E.C.

Sir,—What an unnecessary and useless expense the promoters of the above competition have put themselves to! And, further (but, of course, *that* is of no consequence), what trouble and cost they have put many competing architects to, when all this trouble and expense might in the first instance have been saved! For the work has been given to an architect who, most singularly, happens to have offices in the same street in Leeds (Bond Street) as the offices of the Leeds Masonic Hall Company, Limited, are situated. What a happy ending to a competition, and how pleased we all ought to feel to know that local talent is, in this instance, thus rewarded!—Yours faithfully, H. T. B.

THE USES AND LIMITS OF PERSPECTIVE.

To the Editor of The Builders' Journal.

London, W.C.

Sir,—My last letter was not intended to be critical, and I am sorry Mr. Middleton and his friend received it as such. My object was to suggest further uses of perspective and to express an opinion on certain points raised in the leaderette. Referring to the reply to my last letter, I fail to see how a drawing in lead pencil can be (gaudy?); neither do I assume, as stated, that the selected competition design is chosen on account of its perspective. If two designs be equal in merit (in plans, elevation, and sections, &c.) and one has a perspective and the other has not, I maintain that the former invariably takes precedence. This would be quite fair, as usually the view is optional to all competitors. I admit that "artistic merit" is not strictly to the subject, but in this case I was expressing an opinion as to a point raised in the original leaderette. In regard to the point of view, I have already expressed my opinion (see Builders' Journal, October 25th last). I would remind Mr. Middleton again that the expression of one's opinion does not indicate misunderstanding.—Yours truly, C. HENZELL-ASCROFT.

A QUESTION OF PROFESSIONAL ETIQUETTE.

To the Editor of The Builders' Journal.

Edinburgh.

Sir,—We should like to have your readers' opinions on the action of one of the competitors for the Dundee and Forfar District Hospital.

Plans for an Isolation Hospital for twenty-four beds were publicly advertised for; the total cost, excluding furnishings, professional fees, &c., was to be £4,500. Any person who has experience of buildings designed on the pavilion system knows very well that such buildings as were asked could not be erected for anything like this sum. The assessor, who evidently was called in after the plans were received, stated the cost of the buildings, as detailed in the conditions of competition, at about £8,000, which was also the opinion of Mr. Anderson, C.E., the sanitary inspector of the district. The design submitted by us was placed first by Mr. Morham of Edinburgh, the assessor, and while we were negotiating with the committee, Mr. Cappon, F.R.I.B.A., Dundee, who took the third place in the competition, wrote to the committee and stated that he was prepared to issue schedules and take in estimates, and if the offers received for the whole works exceeded the sum stated by him as the cost of his buildings, namely, £5,400, he would not expect any remuneration for the trouble and expense he had been put to.

The committee agreed to this being done, and we have since received a communication from them that Mr. Cappon had been appointed architect, the gross amount of his offers having come out at about £3,000 less than our estimate, which was £8,000, and, with the proportion of cost for other works, £8,800; so that the gross amount of Mr. Cappon's offers for the work of a hospital containing twenty-four beds and including walling round seven acres of land is £5,800.

The sum stated in your journal a fortnight ago was nearly £7,000. If the former sum is correct, can the work be executed with "first-class materials and good workmanship" for this sum? If the latter sum is correct, it seems to us that the committee have scarcely done what is fair to ourselves. Mr. Cullen, Motherwell, who took second place in the competition, was asked by the committee to make a similar offer to that made by Mr. Cappon, but he declined, as he considered that the only fair way was to submit the plans to a measurer of experience.—Yours truly,

McARTHY and WATSON.

PLUMSTEAD COMPETITION.

MUNICIPAL BUILDINGS AND PUBLIC LIBRARY.

FORTY complete sets of designs have been submitted by architects in compliance with the invitation of the Plumstead Vestry. The proposed site is a large one, open upon three sides, the longest and most important having a frontage to Gossage Road, and the narrower frontages to Ancona Road and Park Road. The conditions require a public hall to to seat 1,000 persons, public library, comprising lending and reference libraries, news and magazine room on the ground floor, and museums with commissioner's room on the first floor, and librarian's quarters. The library is to be located on a space provided at the angle of Gossage and Ancona Roads. The municipal buildings comprise vestry hall, offices for vestry clerk and surveyor, medical offices, rates and electrical offices, and burial board, together with committee rooms.

Of the designs submitted generally it may be said they are of very unequal merit, neither do they display, with one or two exceptions, any marked ability, either as regards architectural treatment or skilful planning. The whole of the designs shown upon 255 drawings were on view to the general public daily last week in the Windsor Castle Hall, Maxey Road, Plumstead.

In the selected design, No. 3, the public hall is placed with its length parallel to Gossage Road at the rear of the site, with entrance from Park Road, and an emergency exit into the main corridor of the municipal buildings, which are entered from the centre of the Gossage Road front. Large ladies' and gentlemen's cloak rooms, with lavatories in the basement, adjoin the entrance from Park Road, while a crush room is provided, entered from a private road, 20ft. wide, at the back of the site. The sanitary inspectors and medical offices are located in a lower ground floor, with the entrance to the rates department at the angle of Gossage and Park Roads. There are male and female retiring rooms under the stage. The vestry clerk's offices are placed on the ground floor, with the surveyor's offices at the angle of Gossage and Park Roads. The council chamber or vestry hall is a square apartment on the first floor, with the gallery entrance adjoining the entrance to the public hall. The committee rooms are arranged *en suite* on the first floor of the Gossage Road frontage. The public library is entered from Gossage Road, the news and magazine room occupy the Ancona Road front, and the reference library is on the right of the entrance.

The elevations are treated with a rusticated order, and are proposed to be executed in brick, with stone dressings. The central feature of the long façade is a dome rising out of a square base, and the angles of the wings are emphasised by rusticated domical turrets. The grouping of the building, as shown by the refined perspective drawing, is skilful, and displays consistent balance of parts. By hiding the large public hall away at the rear, the authors avoid one of the great difficulties in the architectural composition of the building, which makes this design much less expressive than many others exhibited. The arrangement of the municipal offices upon three floors does not appear at first sight very convenient, although the authors provide accommodation for 1,000 persons on the floor of the hall without the use of galleries. The perspective drawing shows an entrance to balance the library entrance, which does not exist upon the plan or elevation, and the authors will certainly require some columns at the back of the public hall to carry the wall of the council chamber and caretaker's quarters.

No. 30, the second premiated design, places the hall at the side parallel with Park Road, the principal entrance being in Gossage Road. The long frontage is divided into three portions on the ground floor by arched entrances 20ft. wide, in which are placed the entrances to the various departments. The library plan is similar to that in the first premiated design. The council chamber is on the first floor, in the centre of the Gossage Road front. It is awkward in shape, and impossible as arranged. The whole plan appears to us complicated, and the elevations much less satisfactory than the selected design.

No. 22, the third premiated design, places the public hall at the side, with municipal offices in the centre. The library is also entered from Gossage Road. All the offices are on the ground floor, with the committee rooms on the first floor. The elevations are feeble and the grouping poor.

No. 16 has a good plan, and places the public hall at the side, with a crush room and the Works Committee room arranged as a supper-room, with provision for refreshments. The library is entered from Ancona Road, and the vestry hall is placed in the centre of Gossage Road and Ancona Road. The elevations are treated with a great deal of simplicity and breadth, the long front being relieved by towers which mark entrances below. The author sends a good wash perspective drawing. No. 33 is remarkable for the good design of the elevations below the cornice line. The public hall is placed in the centre with corridors upon either side. No. 36 shows the hall at the side, and No. 25 with it in the centre, as in No. 33. The elevations treated with a Corinthian order are unsatisfactory. Nos. 18 and 7 are chiefly remarkable for their good perspectives by the same hand as the perspective of the first premiated design. No. 19 places the hall at the rear with entrances from Gossage Road and Park Road. No. 2 puts the public hall at the rear, as in the first premiated design, but with an entrance from Gossage Road as well as from Park Road. The elevations are well designed, especially the centre of Gossage Road elevation. The drawings are made with great freedom. No. 8 has the hall in the centre end on to Gossage Road, with corridors on either side; the municipal buildings balance the library upon the other side. The library is entered from Ancona Road. The elevations are of brick and stone, boldly drawn, with a large tower at the angle of Gossage and Park Roads. A good perspective accompanies the design. Some of the other designs have points of interest, but many are distinctly below the average standard. Mr. Mountford was the assessor.

Up to the time of going to press the names of the authors of the premiated designs have not been announced. We are, however, informed on good authority that the first premium has been awarded to Mr. A. B. Thomas, 7, Queen Anne's Gate, S.W., and the second to Messrs. Hall, Cooper, and Davis, 21, Old Queen Street, Westminster, S.W.

A Municipal Lodging-House at Southampton provides accommodation for 186 single men at a capital outlay of about £11,000 for the building. The electric light is laid on, and baths are provided.

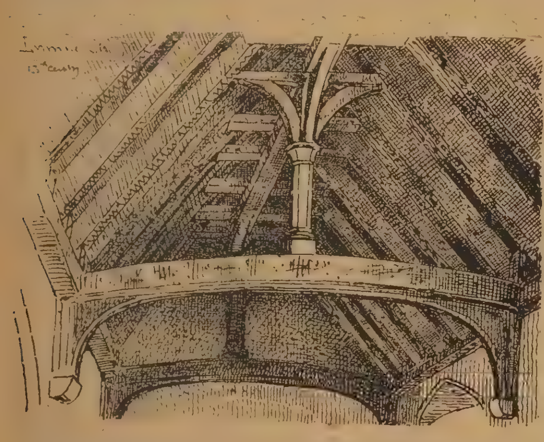
All Saints' Church, Lower Marsh, Lambeth, S.E., is to be demolished, in order to make room for the enlargement of Waterloo station. The church is only about fifty years old, and is not architecturally interesting.

Bricks and Mortar.

Aphorism for the Week.

"Works of true merit are seldom very popular in their own day; for knowledge is on the march, and men of genius are the "præslolatores" or "videttes" that are far advanced o their comrades. They are not with them, but before them; not in the camp, but beyond it."—C. C. Colton.

A Buried City. Many years ago excavations were made on the site of the Roman city Uriconium, which is about six miles out of Shrewsbury, and the valuable relics then discovered are now in the Shrewsbury Museum. The work was, however, brought to a premature conclusion through lack of funds and other causes, but the committees of the Shropshire Archæological Society and the Archæological Institute have now taken the matter in hand, and further excavations have been commenced. Similar work at Silchester had prevented researches at Uriconium being made by the Institute, so that it is pleasing to know the appeals of the Shropshire Archæological Society have borne fruit. Mr. St. John Hope, a member of the Institute, who has been engaged on the Silchester excavations, has commenced operations on a small scale on the south side of what is locally termed "the old wall," but which is, in fact, a part of the Basilica, a great building in the centre of the city. Adjoining this has been found the remains of another important building, which is believed to have been the Court House of the city, and several square feet of the tesselated flooring have been uncovered; but the centre, which was no doubt of handsome design, is missing. What has already been found is ample to justify the belief that there is still remaining under ground very much of interest that no eye has seen for nearly 1,500 years.



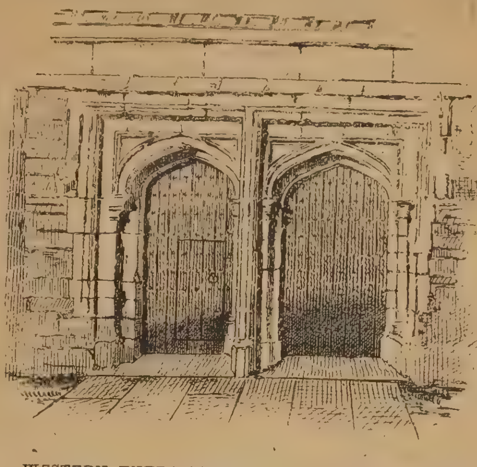
LYMNE CHURCH ROOF. SKETCHED BY JAMES WIER.

Glasgow Cathedral. "My impressions of Glasgow Cathedral" was the subject of a paper by Mr. A. Wagstaff, recently read before the members of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society. Mr. W. H. Baxter, the president, occupied the chair. Mr. Wagstaff, in proceeding with his subject, showed how by degrees the material form of the building might be made to lead every craftsman and artist to comprehend the ideas of Ruskin and many of the classics. He treated less of the architectural features, pure and simple, than the various evolutions which led to their own peculiar existence, and also remarked upon these buildings as being the height of art-excellence of a community and as such to be compared with similar structures of to-day, most unfavourably to the atter. He tried to draw a parallels between the decline of art and social and national affairs, nd gave it as his opinion that until architect and craftsman could work harmoniously and intelligently together, our art would never attain the standard it should. He showed many points about the cathedral which he considered deteriorating; for example, the heterogeneous collection of marble ornaments in the nave and the clumsy bench seating of the choir.

Sketches in Kent. On this page we illustrate three interesting sketches by Mr. James Weir, F.R.I.B.A., of 17, Victoria Street, Westminster, S.W. The western entrance to the fine old tower of St. Mildred's Church, at Tenterden, is situated about nine miles from Headcorn Station, near Ashford. This is the church which legendary lore credits with being the cause of the Goodwin Sands. The sketch of one of the gables of the fine old half-timbered house which stands on the road to Lyminge, a few miles from Folkestone, shows a somewhat unusual construction and a very fine old chimney. The roof of the old church over-looking the sea at Lymne, a few miles from either Folkestone or Hythe, is of about twelfth century date.

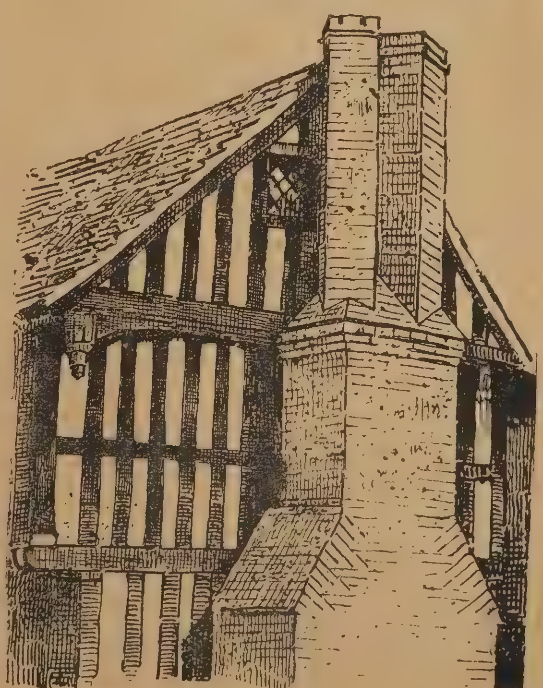
Testing Materials. The management of the Congress of Methods of Testing Materials of Construction, which will be held in connection with the Paris Exhibition next year, is in most distinguished hands. Among the members of the Committee of Organization are M. Candlot, whose reputation as an expert in the testing of materials is world-wide; Professor Bodin, of the École Centrale des Arts et Manufactures; General Gras, permanent inspector of artillery manufacture; General Borius, president of the military committee on engineering science; M. Polonceau, former president of the Society of Civil Engineers, and many others of equal note in the scientific world. The sittings of the Congress will occupy a week, from the 9th to the 16th of July. The foreign participants in the Congress will be divided into three classes, one consisting of a "committee of patronage," the members of which, as well as a certain number of honorary presidents, are chosen by the local committee of organisation from among persons in other countries known to them by reputation, while the second includes persons, or societies, who are acceptable to the managing committee, and who pay, as "membres donateurs," a contribution of not less than fifty francs; and the third includes the "membres adhérents," who pay only twenty-five francs. The committee request those who hope to be present to send early notice of their intention, it being understood that this notice does not bind them in any way, but is asked for simply to guide the committee in their plans.

Michael Angelo's Sculpture. Mr. Edward Lahtéri gave the first of a series of seven practical demonstrations and lectures in Modelling of the figure from life at the Manchester Municipal School of Art last Friday. After discussing the armature and measurements Mr. Lahtéri dealt with the division of the forms of the face, and in this connection he pointed out that one of the most important characteristics of the works of Michael Angelo, particularly in the statues of David and the slave, was the neatness and purity with which each of the forms of the face was drawn without anything being lost in the simplicity of the whole. In a cast of the head of Michael Angelo's David, placed in any light whatever, the head always retained its resemblance, and nothing seemed to have been left to chance. All remained neat and clear, the planes retained the direction required and modelled one with the other, giving movement to the whole surface. On the other hand, when a sculptor merely sought to render the impression of the model by the effect of shadows more or less mysterious, by tricks of texture or of tooling, the works produced, to preserve their quality, must be allowed to remain in exactly the same light in which they were originally produced, under the penalty of their being no longer recognisable—of that which was expressive becoming insignificant, and of reducing the work to a mere piece of plaster having none of those mysterious ideal qualities to be found in the work of an artist like Michael Angelo. In addition to artistic expression, which was the direct result of sentiment and of individual taste, the sculptor required a positive knowledge of the laws of nature. Michael Angelo had proved this to us more than any other master in the numerous studies that he had made of every part of the human body, studies in which the love of Nature and her laws was equalled only by the scrupulous conscientiousness of the work.



WESTERN ENTRANCE TO ST. MILDRED CHURCH, TENTERDEN. DRAWN BY JAMES WEIR.

Ipswich Street Improvements.—A Local Government Board inquiry has been held into the application of the Ipswich Corporation to borrow £14,200 for street improvements.



HALF-TIMBERED GABLE OF HOUSE ON ROAD FROM LYMINGE TO FOLKESTONE. SKETCHED BY JAMES WEIR.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

SOCIETY OF ARCHITECTS.

To the Editor of The Builders' Journal.

West Hartlepool.

Sir,—Would you kindly give me the address of the Secretary of the Society of Architects.—Yours truly, C. F. B.

Mr. C. McArthur Butler, St. James's Hall, Piccadilly, W.

GRAPHIC STATICS.

To the Editor of The Builders' Journal.

Manchester.

Sir,—Can you recommend me a book on Graphic Statics suitable for the Honours Building Construction and the R.I.B.A. Examinations?—Yours truly, P. C.

A good book on this subject is "Stresses and Thrusts," by G. A. T. Middleton. For a more extended work, Rivington's, Vol. 4, might be suggested. R. W. C.

SLAUGHAM PLACE.

To the Editor of The Builders' Journal.

London, W.

Sir,—Can you tell me where I can obtain particulars of an old mansion, Slaugham Place, near Horsham. It is, I believe, ruinous and about to be rebuilt.—Yours truly,

E. B.

An illustrated article dealing with this interesting old mansion is in course of preparation, and will appear shortly.

BUILDING BAY WINDOW.

To the Editor of The Builders' Journal.

Llangollen.

Sir,—A owns a public-house with a projecting sign; B owns a house and shop adjoining. Can B erect a bay window over his shop? The distance between bay window and sign would be about 6ft. Can A prevent B from erecting a projecting bay window?—Yours truly, PROJECTION.

The existence of the sign does not prevent the adjoining owner from erecting a bay window. H. P. B.

R.I.B.A. TESTIMONIES OF STUDY.

To the Editor of The Builders' Journal.

Wokinghan, Berks.

Sir,—I should be glad if you would tell me where a portfolio of drawings can be obtained suitable for copying, for testimonies of study in the R.I.B.A. intermediate examinations, and what you would recommend for this purpose.—Yours faithfully, C. H. P.

The practice of slavishly copying the testimonies of study previously submitted by some other student, is by no means to be commended. Not only should the draughtsman's skill be exhibited, but thought should be exercised. Usually the "orders" are taken from "Spiers" or "Chambers," being redrawn to a suitable scale, but the ornament sheets should be drawn either from casts or from the marbles in the British Museum. The Gothic sheets should all consist of measured drawings, there being ample material in almost all parts of England, and the construction sheets are best adapted, to suit the requirements of the examination, from office examples, though, failing these, Mitchell's sheets of constructional details (Cassell and Co.) may be used as guides. G. A. T. M.

R.I.B.A. PROBATIONERS' EXAM.

To the Editor of The Builders' Journal.

Beaufort, Mon.

Sir,—Being desirous of sitting for the probationers' exam. of the R.I.B.A., will you be good enough to give me a list of the very best books upon the various subjects treated in the R.I.B.A. syllabus, and oblige.—Yours truly,

NEW READER.

For the preliminary: Ordinary school books will suffice for most subjects; Perspective drawing—Middleton's "Linear Perspective"; Mechanics and Physics—Newth's "Natural Philosophy." For the intermediate: History and Ornament—Russell Sturgess' "European Architecture"; Anderson's "Italian Renaissance"; Fletcher's "Comparative History"; all three taken together, with Ferguson for reference; "Chambers'" or "Spiers'" Orders; Paley's "Gothic Mouldings," and Parker's "Glossary" and "Introduction to Gothic Architecture"; Stresses (theoretical construction)—Middleton's "Stresses in Structures." Geometry—Spooner's "Practical Solid Geometry"; Materials—Rivington's, Vol. III., supplemented by "Specification" (published at these offices). For the final: Ornament, as before, except Anderson's "Renaissance," which is not required; Materials and Construction, as before (this includes "Stresses"); also Stocks' "Shoring and Underpinning." For hygienic and general reference: "Modern House Construction (Gresham Publishing Company).—R. W. C.

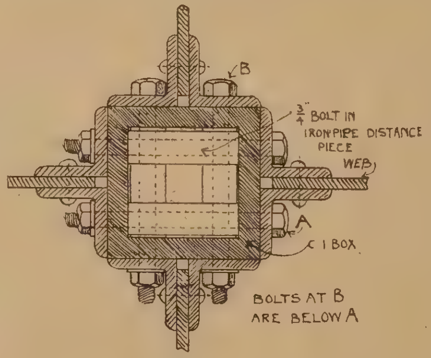
SECURING ANGLE CLEATS.

To the Editor of The Builders' Journal.

Highbury, N.

Sir,—In Model Answer to Question 9, the authors have set the builders a difficult task to bolt the angle cleats to the column. It is a simple error, but one that should not occur in a detail to be worked to.—Yours truly,

F. J. D.



PLAN

F. J. D. has misunderstood our drawing. It was intended that the angle cleats should be secured to the box (*not* the column itself) by means of through bolts, which would avoid the necessity of any manipulation in the narrow interior of the box, as will be seen from the accompanying sketch to a larger scale.—Yours faithfully,

MIDDLETON and CARDEN.

R.I.B.A. CONDITIONS OF AGREEMENT.

To the Editor of The Builders' Journal.

Workingham, Berks.

Sir,—I shall be glad of information on the following points concerning above:—

(1) Clause 2 on the front page reads thus: —"The Employer will pay the Contractor the said sum of ." Is this agreement, on the part of the employer, also held to be binding upon his heirs, executors, administrators, and assigns, without its being so stated? I notice that in the American form of contract, published in "Specification," from your offices, the last clause makes this point clear.

(2) Clause 25 on page 5, reads thus: "If in the opinion of the architect the works be delayed by *force majeure*, or by reason of any exceptionally inclement weather, or by reason of instructions from the architect, in consequence of proceedings taken or threatened by or disputed with, adjoining or neighbouring owners, or by the works or delay of other contractors or tradesmen engaged or nominated by the employer or the architect, and *not* referred to "in the Specification . . . . the architect shall make a fair and reasonable extension of time for completion in respect thereof" (Notice "not" italicised here.) This seems to imply that the contractor is responsible for the delay of parties named in the "Specification." Or could the default of the sub-contractor mentioned, in the matter of being late with the delivery of his goods, be considered a case "force majeure?"

(3) If the completion of the works were so much delayed by this cause that the contractor suffered a fine, could he recover this fine from the sub-contractor in court if there were no written agreement entered into between them as to the date of delivery, except a promise made in a letter?—Yours faithfully,

LEX.

(1) The agreement is binding on the employer's executors and administrators, but not on his heir or assigns. If the employer's personal estate is insufficient to discharge his debts, his real estate will be liable to make up the deficiency, but no personal liability will even in that case attach to his heir.

(2) The contractor would be responsible for delay of parties mentioned in the specification. The default of a sub-contractor is not *force majeure*.

(3) If the contractor did not complete his own work within the time (if any) prescribed by the sub-contract, or (if no time prescribed) within a reasonable time, he would be liable for such loss as the parties had in contemplation when the sub-contract was entered into. This, I think, would include the fine, if the sub-contractor was aware of the contractor's liability to it. A letter written after the sub-contract was entered into would not affect the case; a letter written before it might, and probably would do so. H. P. B.

ARTESIAN WELL.

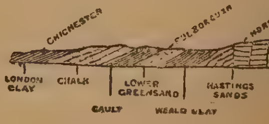
To the Editor of The Builders' Journal.

London, E.C.

Sir,—Can you or any of your readers help me? I have sunk an artesian bore hole in the Pulborough district, near the station of same name and on the bank of the river. After sinking to a depth of 40ft. down to the green sand formation I tapped a good steady supply of clear water, but so heavily charged with iron or other minerals that, though not bad to drink, it is absolutely useless for domestic uses; if spirit be mixed with it, in less than a quarter of an hour the mixture is as black as ink. If I sink below the green sand how far is it likely I should have to go before reaching softer water, capable of being used? It has been suggested to aerate the present supply to soften it. This means plant and someone to attend to it. Both the space and money at my disposal is limited.—Yours, &c.,

B. WATER.

The geological section from Chichester to Horsham, passing through Pulborough, is as shown in the accompanying illustration, by



which it will be seen that there is little prospect of any change in the character of the water unless the weald clay is penetrated, and this would mean boring to a considerable depth. It seems rather a question for a chemist to suggest means of purification.

HENRY ADAMS.

New Patents.

These patents are open to opposition until December 11th.

1898.—Door Checks.—20,793. R. Adams, London, S.E.—A slotted cam-lever is connected to the piston rod of the check and is arranged so that the check is strongest when the door is just closing. On the door being opened beyond a certain distance the lever leaves the slot in the cam-lever and the check becomes inoperative. Many modifications are included in the invention.

Flooring Blocks.—21,343. J. Hawley, Kirkby, Lancs.—Small pieces of wood are bound together by dowels or spiked plates so as to constitute blocks for paving floors, streets, &c.

Fireproof Floors.—21,584. E. Homan, London, E.C.—Bricks are used which have dovetail grooves and projections; they thus key with one another and dispense with centering. The first row of bricks is laid on the wall or girder, and the next row are hung on and cemented, and so on until the floor is made. The floor or ceiling can be covered with concrete, asphalte, or boarding in the usual way.

Machine Guards.—22,791. J. Kershaw, Hebden Bridge, Yorks.—An arm hinged to a rod at the back end of the surfacing or hand-feed planing machine carries a guard that covers the cutters and adjusts itself automatically as the boards are passed through.

Sashes.—23,489. G. C. Brown, Glasgow.—The sash cord is attached to a metal locking plate secured to the stile, and let flush into the latter is a tapered sash-plate of cast-iron. The sash is made to turn inwards for cleaning purposes, and when this is done it becomes disconnected from the plate to which the sash cord is attached, this being prevented from moving upwards by a plate on a hinged batten rod. The sash weight is thus automatically unshipped and shipped by the mere opening and closing of the sash.

Door Springs. — 23,526. H. Woods, London, E.C.—A plate having recesses for three spiral springs is let into the door post, and the outer ends of the springs are connected to a plate on that edge of the door adjacent to the post.

Sewage Tipping Troughs.—24,666. W. M. Ducat, London, W.—The trough is double, and has flat bottoms with splayed sides, a back forming a common mid-feather. The trough rests on a series of knife blades and becomes overbalanced when fed up to a certain level, discharging its contents over the surface of the filter bed.

Purifying Water or Sewage.—25,000. W. P. Thompson, London (*C. G. Gsell, Berlin*).—To the mud obtained from a previous precipitation of dirty or waste water or sewage s added as much sulphuric acid as is required o convert the bases in the mud (alumina, iron xide, iron protoxide) into sulphates; the water is then precipitated with this product.

Fireplaces.—25,400. R. Jewhurst, Margate.—The fireclay cheeks and back are corrugated and have vertical air passages, which roduces greater heat and a more perfect comustion (particularly of small coal or dust).

Prisms.—25,575. F. T. Brearley, St. Helens.—Instead of a number of separate lass prisms mounted together in a frame, one heet of glass is used, this being rolled out on recessed table. One side of the glass is ain, and the other has rows of ribs that form prismatic refracting surface.

1899.—Crushing Jaws.—1,258. J. E. and Broadbent, Stalybridge.—Steel jaws for ushing or breaking machines are made of he same thickness as cast-iron jaws. There e no recesses extending to the back, but ambers are provided, which may be closed the ends or provided with struts or ribs.

Waste-pipe Connections.—12,662. C. ylor, Eccles.—The waste-pipe outside the ilding has an elongated flanged aperture, er which the pipe leading from the bath or closet is bolted. The end of this latter pipe has a loose flange, which is prevented from falling off by the end of the pipe being turned up. By this means no special flange is required for each angle, and the making of the joint is facilitated.

Combined Bolt and Lock.—12,928. J. M. Forney, Nisbet, Pa., U.S.A.—The bolt is mounted in the ordinary way, and has an angular arm that enters a lock casing when the bolt is turned into the branch slot. When required, a key may be employed to lock the bolt in this position.

Wash Basins.—16,221. H. H. Lake, London, W.C. (*The Peck Bros. and Co., U.S.A.*)—The basin has a vertically removable plug, at the bottom of the stem of which is a disc that engages with an inclined valve that is connected by a lever with a handle.

Lead Sockets.—16,800. J. Stewart, Brixton, S.E.—A thin tube of copper, having tacks or lugs, is tinned over and placed in the socket mould, and the socket and tacks are then cast as usual. A cast lead socket is thus produced, in which is embedded a socket and tacks of greater tensile strength than cast lead.

Drawing Curves.—16,809. W. Haedicke, Ilmenais, Germany.—The frame of the device is somewhat similar to a pair of compasses. The legs have hinged shoes, through which passes a pliant rod or ruler that can be secured in any position by set screws. The rod is bent as required, and the curve drawn.

Corner Plates.—17,753. A. Fry, Bournemouth.—In order to prevent the accumulation of dirt and dust in corners—say between treads and risers—these are covered over by a triangular piece of metal, which is secured by nails or screws and may be ornamented.

The following specifications were published on Saturday last, and are open to opposition until December 18th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—14,827, Weber, apparatus for bending or straightening structural iron pipes and the like. 17,438, Ayton, radiating devices for heating or cooling purposes. 21,019, Adams, urinals. 21,887, Mountain, levelling staff used in surveying. 22,740, Hibbert, combined centrolinead and T-square for architects, artists, draughtsmen, and others. 22,742, Dorothy Fletcher, legal representative of the late John Fletcher, gate stop. 22,792, Kershaw, wood sawing machinery. 23,294, Moseley, window casements and casement frames. 24,188a, Villaret and Wahlen, means for transporting bricks and the like. (Date claimed under Patents Rule 19, November 16th, 1898.) 24,329, Rottenburg, fence or gauge for use with fret saws, band saws, and circular saws. 24,709, Oxley and Williamson, chimney pots for preventing down draughts. 24,782, Oates, earthenware or sanitary mangers for horses and cattle. 24,919, Dierickx, doors or shutters for buildings, tramway vehicles, cupboards, show-cases, and the like. 25,063, Boult (*Walsh, Ryckman, and Le Hane*), circular sectional hot-water heaters. 25,565, Page, seats of water closets. 25,618, Whichello, waste and other drain pipes and the like. 25,680, Taylor, ventilators. 25,835, Thorn & Hoddle, ball or float valves. 26,128, Ezra Stead & Edgar Rhodes, stone sawing machines. 26,665, Jackson, incandescent gas burners. 26,991, Sée, roofs. (Date applied for under International Convention, May 21st, 1898.) 27,064, Turnbull, sliding sash windows.

1899.—3,294, Raymond, brick and tile cutting tables. 8,981, Hancock, syphon cisterns for water closets. 9,730, Sayer, pipe and pipe-rail joints. 10,716, Robertson, ball valves for flushing or supply cisterns or the like. 12,871, Borgolte, manufacture of cement. 13,463, Trew, pipes and pipe couplings or connections for sewers, drains, and other purposes. 15,533, Cartwright, tiles. 15,804, Willems, process of manufacturing an enamel applicable to all kinds of bricks and other articles made of clay. 16,365, Ough and Ough, ventilators for buildings, ships, vehicles, and other structures. 16,543, Leet, alarm locks. (Date applied for under International Convention, January 21st, 1899.) 16,589, Bromley, construction of floors, arches, and the like, and centres therefor. 16,789, Pawsey, rain water, ventilating, soil, stack, drain, and like pipes. 16,983, Parsons, nail-making machines. 16,990, Neuburg, gas heating stoves. 18,164, Davies (*Fender*), fire-proof floor construction.

Professional Practice.

Horsham.—A new church is being built on a site in Rusham Road from designs by Mr. G. Scott. The contractors are Messrs. Rowland Bros. The church will be Early English in style, faced with red bricks inside and out. It will consist of a nave, chancel, organ chamber, with clergy and choir vestries. The commencement of the transepts is formed by means of double arches to each, so that at a future time the transepts may be extended further north and south without in any way interfering with the main structure. The west wall and porch will be temporary. When necessary, it is proposed to extend the nave two bays further westward, and then a permanent west porch will be erected. The windows of the church will be glazed with lead-light glazing. These and the chancel and transepts will have stone tracery; the others will be plain lancets. The floor of the chancel will be raised three steps above the nave, and the altar three steps above the chancel. There will be an open chamber roof.

New Brighton.—The Duchess of Westminster recently laid the foundation stone of the Church of Emmanuel, in Seabank Road. The new building is to replace the existing temporary iron erection, and to afford additional and improved accommodation for the parish. The plan of the church, which is to be entirely of brickwork, shows a lofty nave, 30ft. wide by 85ft. long, with low arcaded passages on each side, and shallow transepts, arcaded baptistry, and entrances at the west end on Seabank Road. The chancel is to be 33ft. 6in. long by 25ft. wide, separated from the nave by open timber work. There will be vestries and large organ space on the north side, and a morning chapel on the south side. The floor will be of pitch pine blocks, and the chair seating will give accommodation for about 700 persons. The contract for the first portion of the work has been let to Messrs. Paterson and Sons, of Liverpool, and provides for the complete chancel and accommodation for about 350. The estimated cost of this section is £3,800; the estimated cost of the entire church is £8,000. The architect is Mr. Chas. E. Deacon, of Liverpool.

Sheffield.—The formal opening of Trinity Wesleyan Methodist Church, Firth Park Road, Sheffield, took place on Thursday afternoon last. The church will form part of the Norfolk Street Circuit, and occupies a site at the junction of Firth Park Road and Owler Lane. There are four blocks of buildings. The plan is cruciform, with nave, aisles, transepts, and chancel. The church is 88ft. long by 45ft., and 63ft. 8in. wide across the transepts, and the chancel is 20ft. long; making the total length, including nave and chancel, 108ft. Splendid seating accommodation has been provided for 960 persons. One of the features of the church is the architecture of the pulpit, which is of polished alabaster, richly wrought, supported on an octagonal basis of red Mansfield stone, with polished marble columns at the angles, and is the gift of Mrs. Thomas Cole. The front is also of alabaster and black marble, also the gift of Mrs. Cole. Mr. J. Wills, of Derby and London, was the architect, and Mr. Geo. Carr, of Sheffield, the builder. The cost, including the purchase of land and architect's fees, is £9,000.

Wellington.—A new aisle at the chapel of Wellington College was dedicated on Sunday. The original architect of the College was Mr. George Edmund Street, who took for his model the famous La Sainte Chapelle, minus the crypt. Thus it consisted at first of a nave with apse, but as the number of students increased it became necessary to add an aisle on the north side. Sir Arthur Blomfield, who succeeded Mr. Street as the college architect, supplied the designs, and the building was completed last year. The beautiful stained glass windows, which were originally in the south wall of the nave, have been transferred to the new aisle, and in addition there are a triple lancet window at the west end and a wheel window at the east end, both of plain glass. Though the addition of aisles—or rather quasi-aisles, as they do not follow the strict architectural definition of the term—rather spoils the conception of a collegiate chapel, the general effect is most artistic within and without. The structure is of red brick with white stone dressings, and the apse is adorned with mosaics and frescoes. Much of the carved work represents plants, flowers, and animals indigenous to the district. The total cost of the work has been about £3,000.

St. Andrews.—The new University medical buildings accommodate four scientific departments, namely, anatomy, physiology, botany, and materia medica. There is a laboratory 38ft. by 27ft. in each department for materia medica, physiology, and botany. Each will also have a lecture room, 18ft. by 14ft., and a museum, 24ft. by 14ft. The physiology department will, in addition, have a number of smaller rooms for private research. A large practical room, 45ft. by 22ft., with a fine north toplight, is also in the anatomy department; a lecture room, 20ft. 4in. by 14ft.; and a museum, 38ft. by 26ft. It contains further a theatre, 27ft. by 24ft., with a large north toplight, which can be darkened by means of a sliding shutter. This theatre will also be used by the lecturer in physiology, but the students in that department will enter by a separate corridor. The total cost of these buildings is estimated at about £14,000. Messrs. Gillespie and Scott are the architects.

"**The Furnisher,**" the new trade journal, published by the proprietors of the BUILDERS' JOURNAL, has been welcomed with enthusiasm by all sections of the trades for which it caters. The second number, to be published next week, will contain several fresh features.

Views and Reviews.

THE CONSTRUCTION OF ROADS AND STREETS.*

The series of interesting and comprehensive articles which have appeared under the above title in our contemporary, "The Surveyor," has now been published in book form. The author, Mr. W. H. Maxwell, the assistant surveyor at Leyton, deserves special commendation for having produced a much wanted textbook, which embodies not only the latest ideas and methods of road construction, but also the opinions of the leading specialists in the department of civil engineering. Starting with a history of the subject, and ending with the Regulations of the Local Government Board, it contains all the information that one could desire, and every road surveyor should see that his library is furnished with a copy. The book is one of the St. Bride's Press series, and consequently in handy form, and we can confidently recommend the work to those of our readers who are interested in the improvement of our roads.

* "The Construction of Roads and Streets." By William H. Maxwell. St. Bride's Press, Ltd., 3s. 6d.

THE LONDON UNIVERSITY GUIDE.

This guide provides a very comprehensive account of the London University examinations, and everyone about to sit should obtain a copy of the work, for the information given is highly useful—we might almost say absolutely necessary to successful work—in preparing for the examinations. The book is issued from the University Correspondence College, which has now so bound itself up with the University that it may be said to almost form a part of it. The book contains the calendar for 1899-1900 of the College, in addition to the Guide. The Guide itself consists of five parts:—Part I. gives an interesting and useful account of the history and constitution of the London University; part II. gives particulars of the examinations; part III. a list of special subjects for 1900 and 1901; part IV. advice as to text books; and part V. consists of articles on special subjects for 1901. This last part is in the form of short descriptive biographical notes on the authors dealt with in the special subjects, and will, doubtless, prove of considerable aid to students working without the aid of a master.

"The London University Guide and University Correspondence College Calendar, 1899-1900." Published at 32, Red Lion Square, London, W.C. Price—gratis.

Keystones.

The Grands Prix de Rome.—The awards in the competition for the Grands Prix de Rome were announced on Saturday afternoon at the annual public sitting of the Académie des Beaux Arts. The first prizes are allotted in painting to M. Louis Roger, in sculpture to M. André César Vermare, and in music to M. Charles Gaston Levadé. An address was delivered in honour of the late Charles Garnier, the architect of the Paris Opera House.

The Roman Forum.—There has lately been an extraordinary activity in excavating in Rome, with surprisingly rich results. The Roman Forum in three months is completely changed, while at Pompeii every day shows something new. Professor Baccelli, the Minister of Public Instruction, under whose guidance the work is carried on, has just returned from Benevento and Pompeii, where, at the former place, a majestic Roman theatre has just come to light. A few stones have always been visible, but no one supposed them of any interest, until some preliminary investigations revealed an arch of the entrance to a theatre, composed of enormous blocks of travertine. From the parts brought to light it is deduced that this theatre will be one of the most important and perfect found up to the present. It is about the size of the Roman theatres of Pompey and Marcellus, and is better preserved.

Recent Discoveries at the Inner Temple were the subject of a paper read by Judge Baylis at the inaugural meeting of the winter session of the Royal Archæological Institute on November 1st. In the early part of the present year the Benchers of the Honourable Society of the Inner Temple decided, he said, to increase their safe accommodation, and for this purpose excavations were commenced beneath the hall and the chapel. Under the former building an old doorway and staircase in the east wall of the inner buttery of the Inner Temple were discovered. The appearance of the doorway and staircase indicated that they formed part of the chamber occupied by the Knights Templars, which was consecrated in 1195. The walls were 5ft. or 6ft. thick. Another paper, entitled "The Sepulchral Banquet on Roman Tombstones," was read by Mr. F. J. Haverfield.

CONTRACTS OPEN.

PARISH of LIVERPOOL.

TO BUILDERS AND CONTRACTORS.

The Select Vestry of this Parish are prepared to receive TENDERS for the ERECTION, at Olive Mount, Wavertree, near Liverpool, of a group of BUILDINGS, forming a Cottage Home School, for the accommodation of about 400 children, according to plans and specifications to be seen at the Office of the Architect, Mr. EDMUND KIRBY, 5, Cook-street, Liverpool, between the hours of TEN o'clock a.m. and FIVE o'clock p.m.

Bills of quantities, conditions of contract, and forms of Tender (upon which above offers will be received) may be obtained at the Office of the Architect on payment of a deposit of Three Guineas, which will be returned upon the receipt of a bonâ-fide Tender for the works. Sealed Tenders must be delivered to the undersigned not later than MONDAY, the 11th day of DECEMBER next.

The Select Vestry do not bind themselves to accept the lowest or any Tender.

H. J. HAGGER,
Vestry Clerk.

Parish Office, Liverpool.
November, 1899.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for RETAINING WALLS and FOUNDATIONS for the proposed new PUBLIC OFFICES, Parliament-street, Westminster.

Drawings and specifications, which have been prepared by Mr. J. M. BRYDON, F.R.I.B.A., together with a copy of the conditions and form of Contract may be seen on application to SIR JOHN TAYLOR at the Office of Works.

Bills of quantities have been prepared for the use of Builders by Messrs. FRANKLIN and ANDREWS, of 25, Ludgate-hill, E.C., and Mr. J. E. DROWER, of 16, Great George-street, S.W., and, together with forms of Tender, may be obtained at the undermentioned Office on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon, on WEDNESDAY, NOVEMBER 15th next, addressed to the Secretary, H.M. Office of Works, &c., Storey's-gate, London, S.W., and endorsed "Tender for Foundations, &c., Public Offices, Westminster."

H.M. Office of Works, &c.,
October 1899.

TO BUILDERS and CONTRACTORS.

The Brading School Board invite TENDERS for the ERECTION of a Higher Grade BOARD SCHOOL on a site near the Railway Station, Sandown, I.W.

Plans and specifications can be seen at the Offices of Mr. JAMES NEWMAN, Architect, "Thornton," Sandown, from whom all further particulars can be obtained. Copies of Quantities can be had by application to the Architect on payment of a deposit of 5s., which will be returned upon receipt of a bonâ-fide Tender.

Tenders to be sent in on or before NOON, NOVEMBER 14th, to the undersigned.

The Board do not bind themselves to accept the lowest or any Tender.

(Signed) HARRY C. GRAPES,
Clerk to the Board.

Sandown, I. of W.

CISTERNS.*

THEIR USE AND NECESSITY WITH CONSTANT WATER SUPPLY.

By ERNEST COLLINS, M.I.C.E.

THE provision of cisterns for the storage of water used in factories and private dwelling houses is absolutely necessary to enable the consumer to obtain an uninterrupted supply of water in the event of temporary stoppage of supply, caused by accident or unforseen circumstances. The constant supply of water cannot always be maintained without interruption owing to various causes, such as leakage from, or breakage of main pipes, communication pipes, lead pipes, and internal house fittings, and in some instances through a partial failure of the supply. Such failures have occurred at various times in nearly all our large towns, and in numbers of small towns and villages, resulting in a partial or restricted supply, necessitating the shutting off of the water for varying periods of the day and night. The abolition of cisterns has been found to be very detrimental where a restrictive supply has of necessity been resorted to. In houses of the smaller class inhabited by the very poor, the want of proper receptacles for the storage of water is very inconvenient. It is quite customary in business premises, factories, and large dwelling-houses, to provide cisternage of sufficient capacity to guard against interruptions of supply, and it is imperative that cisterns should be provided for supplying water for the use of steam boilers, hot water boilers, w.c.'s, and urinals. This is provided for in nearly all Acts of Parliament and regulations relating to water supply. As to

The Provision of Reservoir Cisterns

in small dwelling-houses, I am of opinion that cisterns of sufficient capacity for at least twelve hours supply should always be provided, and all the water fittings in the house should be supplied from it, a draw-tap attached to the main supply pipe being provided for drawing water for dietetic purposes.

As regards the size of storage cisterns, there is considerable conflict of opinion as to the capacity to be provided: a convenient form of calculation is a specified quantity, say twenty gallons per room of house or tenement; this for a house of six rooms would give the storage capacity as 120 gallons, by no means an excessive quantity. The practice of supplying dwelling houses without cisterns causes the consumers to place ordinary washing tubs under the draw taps to guard against an interruption of supply, and during the time the water is shut off, all manner of objectionable utensils are dipped into these tubs. In some towns to obviate the inconvenience arising from an interruption of the supply through the shutting down of mains, notice is given in local papers, &c., that the water will be shut off for so many hours on certain days in each week to enable repairs to be carried out. This causes consumers whose premises are not provided with cisterns to make other provision in the shape of a washing tub as described above. Even under this system the water has often to be shut off at other times for the repair of fractured mains, &c.

The Abolition of Cisterns

also causes a large waste of water, as the draw-taps over the tubs are usually left partly open. As an illustration of the wastefulness of this system in London, constant supply was introduced without cisterns to a district of 13,282 houses, having a population of 100,930 persons, and the average consumption was 1,554,152 gallons per day, or 15·3 gallons per head per day. I introduced a constant water supply to a district of 7,708 houses, having a population of 51,043 persons, each house having or retaining its own cistern, with the result that the consumption per day was 10·9 gallons per head. Trade supplies are excluded from both districts. These figures tend to show that from an economical point of view the provision of cisterns is desirable.

In some instances cisterns are provided and the supply pipe to same is also made to act as draw-off pipe. By this plan the whole of the fittings are supplied from the main until an interruption of supply occurs, when the stop back valve nearest the main closes, and the stop back valve nearest the cistern opens, and supplies the fittings from the cistern. This system is very objectionable in practice, as in the event of the water not being shut off in the main for a long period, the water in the cistern becomes stagnant, and upon the water being shut off this stagnant water is supplied to the fittings for the use of the building. It however finds favour with some builders, as the cost is lessened by reason of not having to provide a second or draw-off pipe. In providing and fixing cisterns great care is required to obtain

A good Circulation

of water through them, and the provision of too large a cistern is nearly as bad as the preceding plan. In small dwelling houses and tenements, 20 gallons per room is sufficient, and in large houses, 30 gallons per room will not be excessive. Factories, business premises, stables, &c., require sufficient storage for at least twenty-four hours' supply. The system recommended by the writer where cisterns are provided from which fittings are supplied is as follows:—

A communication pipe is taken from the main to the premises, a screw-down stop valve being provided at the entrance. This pipe is carried to the cistern and attached to it; and before reaching the cistern there are one or more draw taps for drawing water for dietetic purposes only. The remainder of the fittings supplying w.c.'s, urinals, taps, &c., are supplied by a separate draw-off pipe from the cistern. By the adoption of these arrangements the water is kept circulating through the cisterns for use of urinals, w.c.'s, &c., and in the event of an interruption of the water supply, the occupiers are enabled to continue to use water for sanitary and other purposes uninterruptedly for at least twelve hours.

In another system, adopted in some cases, the whole of the draw-taps for drawing water are supplied from the main supply pipe, and the fittings supplying w.c.'s, urinals, &c., are supplied from the cistern. This system no doubt has its advantages, but when the supply is interrupted, the occupier can continue the use of water for sanitary purposes only, and is unable to obtain any water for other purposes without, as frequently happens, dipping out of the cistern supplying closets, &c. Under this system also, the cisterns are very much neglected, no person taking any trouble to cleanse them, and it has been found that in some cases the water becomes so bad as to partly stop up the supply to the w.c.'s, &c. The

Choice of Cisterns

depends in a large degree on the quality of water supplied, and also for what purpose they are intended to be used. For hard water, the ordinary galvanised cisterns are extensively used, and last many years; these are usually sold without covers, and are generally provided with covers of wood, zinc, or other light material. Wooden cisterns, lined with lead or zinc, slate cisterns, and stone cisterns, are all provided with covers similar to the galvanised iron cistern. Lead and zinc-lined cisterns and those made of slate and stone are not now generally used, and are gradually being replaced by the galvanised cistern. Water-butts are prohibited by nearly all water works regulations and are almost extinct. The closed cistern to withstand the pressure of the street mains being very expensive is very little used, and when connected with heavy pressure is highly dangerous; also, no provision is made for cleansing, and it appears to be unsuitable for general use.

An improved "self-cleaning air-tight cistern" has been devised by Mr. Hugh Alexander, chief sanitary inspector for Shoreditch. This cistern is expensive, but it is undoubtedly a valuable improvement in domestic water cisterns. It has been adopted in the design first advocated by the London County Council for its new model dwellings at Millbank. In filling water-bottles the tap should be allowed to run for a moment, so as to flush the sediment out from the leaden pipe before the bottles are filled. Bright water from the iron cistern is then obtained. It is an excellent and practical cistern, but at present its cost appears to limit its general use.

The galvanised iron and wooden cisterns lined with lead or zinc are unsuitable and dangerous for soft water. Slate, stone, cement, and other compounds of a like nature, are alone suitable for soft water.

The position of cisterns is one which requires special attention, and some of our architects appear to have forgotten to make provision for their reception, and cisterns are fixed in any available situation, inaccessible to the ordinary occupier for cleansing and inspection. The practice of fixing cisterns on the roofs of buildings, even in the rare cases where means of access are provided, is very objectionable, as these cisterns, although covered, are usually unprotected from frost and the sun's rays, and are rendered useless by a slight frost. Cisterns in these positions should be well protected against the effects of frost, and tight-fitting covers provided. Another common practice is the fixing of cisterns in roofs. They are unseen, and their existence is often unknown to the occupier.

Still another objectionable practice is fixing cisterns under floors—in some cases under bedrooms and even under w.c. floors—and allowing soil pipes or drain ventilating pipes to pass through them. Cisterns should be placed where they can be seen, and should be readily accessible for periodical inspection and cleansing, and it should be the duty of our sanitary authorities to see that the cisterns are placed in such suitable positions. It should also be the duty of waterworks authorities, through their staff, to give notice to the sanitary authorities of the existence of dirty cisterns in order that notices might be served for cleansing. As regards the

Cleansing of Cisterns,

it is difficult to secure good administration on the part of all householders in respect to the care of their own water cisterns; and to some extent the regulation of the water companies requiring an overflow warning pipe, but allowing no standing waste of any sort, makes it impossible to clean out the cistern by direct flushing. This regulation might be modified with advantage. In no case ought a cistern to be so constructed that it cannot be emptied except through the drinking-water taps. It is very difficult to effectively clean out a cistern, except through a standing waste so inserted as to completely empty the cistern, and to allow it to be flushed out effectively by the supply tap, while the sides and bottom of the cistern are lightly swept down with a soft hand broom. The pipe for the service of the drinking-water taps should in all cases be an inch above the bottom of the cistern, so as to allow a thin layer of sediment to subside below the level of the drinking-water outlet. This condition alone renders it impracticable to efficiently flush out sediments through the drinking-water taps. A standing waste, leading to the warning pipe, is the best arrangement. In case of overflow the proper warning is then given; while by simply lifting the standing waste the cistern can at once be flushed out perfectly. Of course the standing waste must in no case have any sort of communication with a drain pipe. A rubber garden hose pipe may be attached to the end of the warning pipe while the cistern is being flushed out, and in that way the flushing water can be discharged over a trapped gulley at a convenient point.

The Manchester Statue of the Queen, for which a site has been selected opposite the Infirmary, is to be of bronze and not of marble as was originally intended. The change has been made on account of the liability of marble to be affected by the smoky atmosphere of the city.

---

* A paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

Builders' Notes.

Building at Dumfries.—The value of the plans passed during the year now ended was £20,520, this being made up as follows:—Dwelling-houses, £14,000; hotels, £1,000; business premises, £4,180; offices, stables, &c., £560; lodging-houses, £600; halls, £180.

Jerry Builders Reprimanded.—The jerry builders in East Worcestershire have received a sharp lesson from the Yardley District Council. For several months past complaints have been made to that body with regard to jerry-built houses, and representations have been made to the builders concerned. No improvement, however, has taken place, and now the local authority has ordered the demolition of certain buildings at Wake Green.

A New Stone-sawing Machine.—An exhibition of the capabilities of the patent "Rapid" stone-sawing machine was recently given at Wellington Bridge, Leeds, to a number of local quarry owners and others interested in the stone trade. Within an hour the fourteen blades, each having thirteen notches, sawed through two blocks of Howley Park stone, measuring respectively 6ft. by 5ft. and 5ft. square. Compared with other apparatus in use for cutting stone, marble, and granite, the machine would appear to be a decided and most valuable improvement. It is constructed on an entirely new principle, and the inventors, Messrs. Rhodes and Stead, claim that it will turn out 100 per cent., and in some cases 400 per cent., more work than any other machines in the same time, and with the same cost of power and labour.

Remarkable Differences in Tenders.—For the execution of certain works on the Skibo Castle Estate of Mr. Andrew Carnegie, thirteen firms recently sent in tenders. The highest sum asked was £22,147, the next tender was for £15,222, then there were various intervening prices down to £11,263 (which was accepted), the lowest of all being £9,156. These widely-differing figures seem to indicate either a haphazard method of framing estimates, or very different notions as to the proper percentage to be charged for profit. The works to which the tenders had reference form only an item in the important improvements which Mr. Carnegie has arranged to carry out at Skibo. Two large locks are to be constructed, for boating and angling purposes, together with a dam 250 yards long and 12ft. high. At a point near the castle a large swimming-bath is being erected, which is to be supplied with water drawn from the Firth by a steam pumping-engine. It is also contemplated to make a new approach to the castle from the west, about a mile and a half long, and to lay out the grounds on both sides as parks.

London County Council.—At the meeting of the Council on October 31st it was decided to seek Parliamentary powers to acquire Spitalfields Market. The Water Committee reported that they were of opinion that the only way to ensure a high state of purity in the London water supply was to make a daily examination of the water delivered to the consumers. The chemist was authorised to continue the analyses of the water of the Thames and Lea above the companies' intakes, and of the water drawn from the companies' mains, for a further period of three months, at an expenditure of £37 a week. It was decided to purchase certain properties in order to partly widen Bell Lane, Whitechapel, from 11ft. to 40ft. The net cost of widening Bell Lane throughout, and the southern portion of Crispin Street, would be about £133,900. The Highways Committee reported that £902 had been spent in repairing the damage to the Queen Victoria Street subway, caused by the subsidence of the ground in connection with the tunnelling of the City and Waterloo Railway Company. The company are being asked to refund this amount to the Council.

City Corporation.—At the last meeting of the Court of Common Council the Lord Mayor said this year would be memorable for the passing of the London Government Bill through Parliament, whereby the advantages of direct municipal life, so long enjoyed by the citizens of London, had by the creation of thirty new municipalities been extended to every district of the entire metropolis. At the instance of the Sanitary Committee, it was resolve to seek Parliamentary sanction next session for the erection of a crematorium at the City of London Cemetery at Ilford, and for powers to enable the Corporation to construct baths and washhouses in the City. It was also decided to seek powers to permit the Corporation to make provision for the accommodation of pipes, wires, and cables under the public ways, for the construction of bridges, and to apply the consolidated rate to the maintenance of open spaces in the City. The Court, on the application of the Charing Cross and Strand Electricity Supply Company, approved a site at Marsh Gate Lane, Bow, for a generating station. The Bridge House Estates Committee were instructed to report upon the existing facilities for traffic across the river; to make suggestions for increasing the number of bridges, and to report upon the desirability of constructing a viaduct from Queen Street on to Southwark Bridge.

Who should Repair the Roof?—At the Leeds County Court on Friday, Mr. J. C. Kershaw, surgeon, Wellington House, Bruce Street, New Wortley, sued Mr. Thomas Eddison, his landlord, for £7 3s. 7d., for breach of covenant. Plaintiff took from defendant Wellington House, on a ten and a-half years' lease at £54 a year, the agreement stipulating that the plaintiff was to keep the inside of the house in good repair, and the defendant to repair the exterior. Soon after entering the premises plaintiff found that the roof of the surgery, which had been built by his predecessor, was in very bad condition. The lessor put on new slates, but the roof, which was flat and had a skylight, was still leaky, and plaintiff wrote to him repeatedly, informing him that from time to time water came through into the surgery and caused much inconvenience and annoyance. As nothing further was done by the lessor to remedy the defect, the plaintiff consulted Mr. Winn, architect, and, at his suggestion, had the roof stripped and re-slated, the total cost of the repairs—including Mr. Winn's fee—being £7 3s. 7d., the amount of the claim. Mr. Waugh (for the defendant) submitted that there had been no breach of the covenant, inasmuch as what the lessor agreed to do was to keep the premises in repair, not to carry out any re-construction, which was practically what the plaintiff had done. His Honor gave a verdict for the plaintiff for the amount claimed, less the architect's fee of two guineas, with costs.

Protection of Workmen on Buildings.—An important issue was raised at the Victoria Law Courts, Birmingham, in an inquiry held by the City Coroner, Mr. J. Bradley, concerning the death of Walter Broughton (25), a journeyman bricklayer, of West View, Clent. The deceased was engaged with another man in tiling the roof at the Higher Grade Schools, Whitehead Road, Aston, which are being erected by Messrs. John Bowen and Sons. Mr. S. H. Knyvett, H.M. Inspector of Factories, was present. At the inquiry no member of the contracting firm was present, but their foreman stated that the reason there had been no protection for the men working on the roof was that they had not had time to raise the scaffolding; the deceased had slipped whilst walking along the cornice, and fell a distance of 45ft. to the ground. He was conveyed to the General Hospital, where he died shortly after admission. The jury returned a verdict of "Accidental Death." Mr. Knyvett said it was a very great pity that some measure of protection was not afforded under the Factory Act to persons employed on buildings such as there was to those employed in factories. In a case of this sort, if it had come under the Factory Act, the firm would have been bound to have provided some protection. Factory inspectors had no power to compel builders to provide fencing or other safeguards, and the Home Office had no power to issue any kind of order. The coroner intimated that he would probably write to the Home Office, and Mr. Knyvett stated he would support him. Mr. Shipley, the foreman, agreed that the inspector's idea was a very good one, and he hoped some such definite rule as to scaffold fences would be laid down.

Admiralty Contracts.—The case of the Admiralty Commissioners v. Bligh was heard before Mr. Justice Grantham and a special jury on Friday. Mr. Acland, in opening the case, said that in 1894 the Admiralty were desirous of erecting in the river, just above Sheerness and below Chatham, important defensive works, for the prevention of torpedo-boat attacks up the River Medway. These defences consisted of what was called an anchorage and a pier on either side of the river. It was alleged that defendant had put in piles of timber of improper length. The defendant had also omitted, in some instances, to use concrete and rubble where specified, and had completed the whole work in a way that might have proved to be a danger instead of a defence. The work done showed that the defendant must have deliberately made up his mind to commit a fraud. Suspicion was aroused with regard to the bolts used, and on examination a certain number of them were found to be spikes, with the appearance of bolts, and must have been made on purpose to deceive those whose duty it was to look after the work. Mr. Thomas Sims, Superintendent Civil Engineer to the Admiralty, gave evidence in detail, showing that the contract had been most improperly carried out, the piles in some cases being 6ft. and 7ft. short, and, instead of 20ft. of concrete being used in one place on the south shore, only 12ft. were used, and the mud below had not been removed. Mr. Witt (for the defendant) said he had listened to the case, and he did not see that he ought to resist it, but he wished to say this: The certificates had been given, and the work had been completed nearly two years, before the case was made against the defendant. Of course, that was no answer to the claim now put forth as to the hidden nature of the defences, and he therefore said the plaintiffs should have a verdict for the £914. Mr. Joseph Robert Bligh, the defendant, was then called, and said he had a person on the works in conjunction with the Admiralty officials, and, though he was there occasionally, he had no improper dealings in any way with Mr. Monkhouse. Until he received the letter from the Admiralty complaining of the work, he did not himself know there was anything wrong. Mr. Justice Grantham said, as the matter stood, it was not necessary for him to sum up, but in this case he thought he ought to make a few remarks in regard to Government contracts. Government contractors ought to know that these matters might be criminal; if they were not, then they ought to be made criminal. In his opinion, where a man entered into a contract where the safety of the country was concerned, and committed a breach of it, he committed a crime. For instance, the whole of the troops on board one of our ships now on their way to South Africa might be burned through a contractor supplying heated hay, and could they imagine anything so criminal? Could any punishment be too severe for people who broke faith in that way? He mentioned this because he considered that when a person broke a contract in which the safety of our country was concerned, he ought to be dealt with as a criminal. If it was not a criminal offence it ought to be made one, and when the defendant said he trusted to an agent he could only say that it should be a criminal offence to trust to an agent in that way; but he thought the jury would not believe him.—The jury, by direction, then returned a verdict for the plaintiffs for £914, and his lordship gave judgment for that sum, with costs, and certified for a special jury.

Masters and Men.

Strike of Bricklayers at Ilford.—A serious delay is occurring in the erection of two schools for Ilford School Board, through a strike on the part of the bricklayers. The cost of one of the buildings is £21,000, and of the other £16,000. The former should have been finished some time ago.

Eight-Hour Day for London Engineers.—The eight-hour-day system has been intoduced at Messrs. Penn and Sons' engineering works, Deptford and Greenwich. The works have recently been taken over by the Thames Ironworks Company, Limited, who have followed the system at their other works for some time past with satisfactory results.

Strike at Newark, Mon.—The men at Messrs. Cafferata and Co.'s plaster works struck work last Tuesday week. The strike only affected a section of Messrs. Cafferata's men—those interested in the heaving of the plaster from the pits. About seventy men struck for an increase of wages, and were incensed to find that thirty of their comrades refused to act with them. When the latter attempted to resume work last Wednesday morning, the strikers menaced them. The police were sent for, and arrived in time to stop violence to the alleged "black legs." The strikers were dispersed by ten policemen, and the works were guarded. The men went away, but returned in the vicinity of the works on Thursday, and intimidated those who were in defiance of them continuing their employment. For some time matters had assumed an ugly look, but the presence of the police had a salutary effect. Subsequently a compromise was arrived at, the masters agreeing to give a halfpenny per yard more for the plaster raised. It is understood that thirteen summonses taken out by Messrs. Cafferata and Co. against the men for intimidation have been withdrawn.

The Scottish Carters' Association recently issued a circular to the employers in the East and West of Scotland threatening to strike unless an increase in wages of 2s. per week and a reduction to fifty-six hours per week, and payment for Sunday labour was given. The demands have been settled by a compromise, the employers agreeing to give 1s. advance in wages. The question of Sunday labour was left over. Mr. James Coull presided over an attendance of probably between 500 and 600 of the Edinburgh and Leith carters, to consider the offer. After its acceptance the following resolution was agreed to, on the motion of Mr. A. Philip, secretary of the Leith branch:—"That this mass meeting of Edinburgh and Leith carters, having heard of the concessions made and offered to the men, we, with a view to promote harmony and a fair understanding between employers and employed, and with a desire to avoid a conflict which would jeopardise the interests of the trade and the workmen, agree meantime to accept the terms offered of 1s. per week of advance all round as a partial settlement, and call upon all carters to at once close their ranks by joining the Scottish Carters' Association, as the only effective means whereby the carters of the country will secure wages and other conditions comparable with other trades."

The Workmen's Compensation Act.—At the recent dinner of the Article Club, Mr. Richard Bell said his society (the A.S.R.S.) had fought thirty-eight cases in the law courts, and there had been thirty-eight different decisions. Sir Charles Dilke said the Act was a great experiment, and there was therefore difficulty in applying it to those cases where ill-health was caused by the nature of the employment. In the cases of small employers he preferred the German system, under which the State, and not the employer, should pay the indemnity, and be the national assurance authority. The Act was a novel experiment, and therefore legal decisions must necessarily put different constructions on the Act to those expected by its promoters. These promoters desired that the Act should be covered by insurance schemes covering all injuries, and he for one believed that such schemes offered a solution which ought to be taken advantage of. In his own constituency, such a scheme had been adopted. Workmen and employers paid half the cost of insurance, and it had been found that the accidents during the first two weeks cost as much as all the others, and therefore to apply the Act to all accidents meant doubling the cost of insurance. He could not see that it was possible to bring in the agricultural labourers, the shipping interests, and the fourteen-days accidents under the Act unless the State would be a guarantor that compensation would be paid. Mr. Justice Darling said whether the Act had worked well or not they must admit that there was probably never put upon the Statute Book a more difficult Act to administer. It was the first attempt to make a piece of admitted Socialism a part of the law of England. It might be the beginning of further Acts in the same direction, but they must not expect that legislation, which did not deal with crime or property, should always be interpreted in the same manner by different judges.

Leeds City Carting Agents' Association.—A meeting of the Leeds City Carting Agents' Association was held last Saturday in the Old George Hotel, Briggate, to protest against the by-law of the Corporation prohibiting one man driving more than one horse within a mile radius of Commercial Street. The chair was occupied by Mr. S. J. Stott. The association has only been in existence for nine months, but has had a very successful career, already having nearly fifty members, owning between four and five hundred horses. The objects of the association are to promote the commercial interests of the members and to afford them assistance, and, where necessary, protection in legal matters. The secretary, Mr. J. McGrail, stated that he had been informed by the Town Clerk that the by-law had not been put into force yet, and in all probability it would not be till January 1st. The law would make a very serious difference to many agents, and there were members of the association who had been put to an expense of £50 during the week in obeying the by-law, which they believed to be in force. He complained of the interference of the police in stopping drivers with two horses, and taking their names, without giving them any notice. Mr. J. T. Harrison considered that a man in charge of two horses and carts had quite as much control over the horse behind as the man who was driving a team of three horses had over the horse in the traces in front of the other two. The by-law was most unfair. If the Corporation decided that there should be one man for every horse, they should apply the rule to the whole city, and not limit it to a mile radius.—Mr. Redshaw said the result would be that agents would be compelled to employ a man and a boy or two boys. They could not afford to employ two men for two horses.—Mr. Treen favoured the idea of one man for one horse, on the ground that it would be better in the long run for the agents, who, if they were united, could secure higher rates of charges. Notwithstanding the fact that bran had gone up 9d. a bag, and blacksmiths charged 6d. extra for shoeing horses, the charges had remained the same.—After further discussion, it was decided, on the motion of Mr. Treen, seconded by Mr. L. A. Pyrah, to appoint a committee to inquire from the Town Clerk or Chief Constable how matters stood with regard to the by-law, and report to the next meeting.

Hensol Castle, Glamorgan. — Extensive water supply and drainage works are being executed at this castle for Lady Price Fothergill. New farmhouses and repairs are also being carried out at a cost of over £4,000. Messrs. George Jennings, of Lambeth, are executing the water and drainage works, and Mr. W. A. James, of Cowbridge, is doing the remainder under the superintendence of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff.

Engineering Notes.

Ludgate Hill Station is to be lighted with electricity.

Haslar Bridge, connecting Gosport with the Naval Hospital, Portsmouth, collapsed on November 1st, through a barge colliding with the main support.

Fifty Electric Tramcars for Leeds are to be supplied by Messrs. Dick, Kerr and Co., Ltd., London, whose tender amounted to £27,500, or £550 per car.

A Large Sum for Experimenting.—The London School Board are going to spend £5,000 upon experimenting with a new system of ventilation at a school now being built in the Hackney district.

Croydon Tramways.—The Corporation of Croydon, having purchased the tramways, have agreed to equip them on the overhead system of electric traction, and to lease the undertaking to the British Electric Traction Company, Limited.

Singular Electric Light Fatality.—A boy employed at the Cleveland Steel Works, Eston, Middlesbrough, recently fell asleep, and, on awaking, yawned and stretched out his arms. One of his hands came in contact with the electric lighting wires, and he was killed instantly.

Faversham to Maidstone.—The Earl of Jersey and Colonel Boughey, two of the Light Railway Commissioners, gave favourable consideration on November 2nd to an application for an order to construct a light railway from Faversham to Maidstone, at a cost of £87,000.

London Docks Improvements. — The entrance to the South-West India Dock is to be lengthened and deepened. The present lock is 300ft. long, and the depth available for the full width is 23ft. 6in. The lock will now be lengthened to 480ft., with three pairs of gates, and deepened to 29ft.

The Manchester Gas Explosion.—It was stated at the inquest on the body of Mr. Stevenson, the engineer, that the explosion at the municipal gasworks in Rochdale Road, Manchester, was caused by a naked light setting alight a stream of gas whilst a transfer was being made from an old to a new meter. Thirteen persons were injured. The clock tower is to be taken down.

Improvement Schemes at Heckmondwike.—On Thursday Mr. W. R. Slacke, one of the inspectors of the Local Government Board, held an inquiry at Heckmondwike into the District Council's application for sanction to borrow £19,260; £14,000 being for electric lighting plant, £3,438 in respect of public baths, £1,540 for the purchase of land as a site for public offices, and £282 for the erection of a fire station.

The Welsh Water Scheme Pronounced Unnecessary.—In his report to the Middlesex County Council, Sir Frederick Dixon-Hartland, Bart., M.P., the chairman of the Thames Conservancy Board, says that the system of intercommunication between the metropolitan water companies has proved that the Thames is capable of supplying the needs of London. When once the system of reservoirs adopted by Parliament is in working order, adds Sir Frederick, all pretence for saddling London with the enormous cost of bringing water from Wales will be absolutely unnecessary.

Liverpool Engineering Society. — The first meeting of the twenty-sixth session of the Liverpool Engineering Society was held on November 1st at the Royal Institution, Colquitt Street, when Mr. A. Bromley Holmes, M.I.C.E., delivered his presidential address. The present session, he said, being the last complete one of the nineteenth century, was especially appropriate for retrospection. The century had been more particularly distinguished for the discovery and development of inventions for the transmission of power in the form of electrical energy, and its distribution for mechanical and other purposes. He discussed the progress in the use of electricity in domestic service, in the hospital, telephonic communication, illumination, traction, manufactories, and other branches.

Electric Lighting at Dudley.—The Town Council desire to borrow £33,000 for electric lighting purposes, and £5,280 for municipal buildings. A Local Government Board inquiry has been held.

The Institute of Junior Engineers held their inaugural meeting at the Westminster Palace Hotel on Friday. Sir William H. White, the retiring president, received a hearty vote of thanks for the manner in which he had carried out his duties during the year, and he introduced Mr. Charles A. Parsons, the new president, and decorated him with a badge of office.

The Paignton Water Supply.—At their meeting on November 1st the Paignton District Council decided to proceed with their big water scheme. An effort was made to get the Local Government Board to consent to the Council proceeding without an Act of Parliament, but this failed, and the town will have to bear the expense of a special Act, as well as of the £40,000, or more, that the scheme will cost. The scheme comprises the purchase of 700 acres of land at Holne, and the construction there of a large reservoir. The only alternative was the securing of a supply from Torquay, but the Council unanimously preferred having an independent supply that will provide for all future developments. The consent of the ratepayers will have to be obtained at a statutory meeting before the Council can proceed.

Davos-Platz Funicular Railway. — A funicular railway up to the Schatzalp at Davos-Platz has just been completed. It commences at the rear of the Kurhaus, and is about 2,200ft. long. The force used to propel the cars is electricity, which is generated in the valley near the ice rink by dynamos driven by gas engines (an English patent), the mixture of air and gas being exploded not, as is usual, by a jet of gas, but by an electric spark. This is one of the first funiculars in Switzerland to use electricity as a motive power. The line cost more than double the price estimated—the amount expended being about half a million francs. The two Kurvereins of Davos-Platz and Davos-Dorf have just been amalgamated, the orchestras combined, an electric tramway is shortly to be inaugurated between Platz and Dorf, and in many ways a new epoch in the development of the resort seems to have been reached. The foundation stone has just been laid of a large German sanatorium, and another establishment of the same kind is in course of erection on the Schatzalp, and will be opened next year.

Rust in Iron Pipes.—Last week we briefly referred to the paper on "The Incrustation of Iron Pipes at the Torquay Waterworks," read before the Institution of Mechanical Engineers; we now give a few more particulars. The Torquay water mains lose 21 tons of iron every year owing to the action of the water passing through them. They would lose much more were it not for the special coatings that are placed on the pipes to preserve them. But there is no cause for alarm. Residents in Torquay are not drinking 21 tons of iron a year. The soft water from the moors in passing through the pipes draws out the iron, but does not absorb it into itself. Having drawn out the iron, it solidifies it again in the shape of rusty blisters all over the inside of the pipes. These blisters are always growing, and would in time completely block the pipes, but every year the entire length of the main is scraped. The largest main is only 10in. in diameter, so that men cannot go through to clear off the rusty blisters. The scraper is a strange-looking machine, nearly 4ft. long and 132lb. in weight, and was invented by Mr. W. Froude in 1873. It is placed in the main at the reservoirs, and is forced through the pipe by the weight of the water behind it. Seven men are employed to follow the scraper, the rush of which they can distinctly hear, and which, at times, travels at the rate of $7\frac{1}{2}$ miles an hour. The following of the scraper "o'er hill and dale" is said to be exciting. The flow of water through the mains after each scraping is increased by 28 per cent., and, of course, the diameter of the pipes is gradually growing. For instance, what was once a 10in. pipe is now $10\frac{1}{2}$in. in diameter.

Surveying and Sanitary Notes.

For Completing a Scheme of Sewerage for Aldridge, the Walsall Rural District Council seek to borrow £2,500.

Privies and Closets at Stourbridge.—The Sanitary and General Purposes Committee have been instructed to take steps to bring about the conversion of all privies into water closets during the next seven years, or earlier.

New Appointment.—The First Commissioner of Works has appointed Professor W. H. Corfield, M.D., of University College, Consulting Sanitary Adviser to the Office of Works for the Royal Palaces and Public Buildings in charge of the Department.

£15,520 for Sewage Purposes at Southend, £420 for public walks and pleasure, and £9,300 for the construction of works for the utilisation of sea water for sewer flushing, street watering, and other purposes, were asked for by the Council at a Local Government Board inquiry.

Sewage Works at Ranceby.—The Sleaford Urban District Council on Wednesday evening adopted a plan for the disposal of the sewage of the new County Asylum at Ranceby at an estimated cost of £960. Towards this sum the County Council have consented to contribute £500.

Wallasey Improvements. — The Local Government Board have intimated to the Wallasey District Council that they are not prepared to sanction a loan of £7,580 for the construction of a new road from Wallasey Village to the seashore. They have sanctioned the Council's application for borrowing powers for £10,000 for electric lighting purposes.

New Street in the City.—The opening of Lloyd's Avenue will form a connection between Fenchurch Street and Crutched Friars, and will give a direct line of communication between these thoroughfares and the Minories, the Tower Bridge, and the docks. The new street is 40ft. wide and 450ft. long, and has cost about £13,000, the Corporation having undertaken the construction of all the sewers, subways, and vaults beneath. The opening ceremony will be performed on November 11th by the new Lord Mayor.

Beautifying London.—At the meeting of the Metropolitan Public Gardens Association on November 2nd it was decided to offer to plant trees in various thoroughfares, and to support schemes for acquiring Albert Square, E., as a public garden, for the extension of Brockwell Park, and for converting the Latchmere Allotments, Battersea, into a public recreation ground. It was stated that the association had begun the laying out of the churchyard of St. Mary's, Plaistow, and that similar work would soon be commenced at Christ Church, Blackfriars.

Manchester and Salford Sanitary Association.—A meeting of the committee of this association was held at the offices, Brazenose Street, on Wednesday, Professor D. J. Leech in the chair. The issue of a new series of health publications was approved, and steps were authorised with a view to the holding of a Health Conference in Ancoats. On the suggestion of Mr. Horsfall, it was decided to memorialise the Government in favour of the appointment of a Royal Commission on Physical Training, and to invite all societies throughout the country likely to be interested in this important subject to co-operate.

Proposed New Sewage Works at Newcastle-under-Lyme.—At the last monthly meeting of the Corporation, the Sewage Works Committee presented a report stating that the sub-committee appointed for the purpose had visited the sewage works at Lichfield, Pelsall, Rushall, Walsall, and Malvern, and recommended the adoption of a complete scheme of coal-filter for the purification of the sewage of the borough, in accordance with a scheme submitted by Mr. J. Edward Willcox, of Birmingham. New sewage disposal works had been rendered necessary through the County Council complaining of the impurity of the effluent discharged from the present works. The cost of the new scheme, including payment of commission to Mr. Willcox, was put at £13,025. The recommendation was adopted.

Supposed Dick Turpin Tunnels.—On Wednesday last one of the Highgate Harriers was injured through a subsidence in the roadway; the cavity was about 6ft. wide and 15ft. deep. Upon examination it was found that the upper portion of a subterranean passage had collapsed, and, on tracing the course of this passage, another was discovered. The main tunnel, which is of considerable width, leads on the left to the Flask Tavern, in South Grove, close to St. Michael's Church, and on the right it is supposed to lead to the open fields near Caen Wood, the seat of the Earl of Mansfield. The Flask Tavern, a very old house, is popularly supposed to have been one of the haunts of Dick Turpin. The house has numerous and extensive cellars, with trapdoors leading from the rooms above, and close by is the stable which is said to have sheltered Black Bess. It is supposed that these subterranean passages were constructed in order to give a ready means of escape from the house in times of danger.

Trade and Craft.

A NEW PAINT.

Of recent years a great deal of attention has been given to the manufacture of paints, oils, and varnishes, and, as a result, numerous novelties have made their appearance. One of these is "Siderosthen" paint, which is made by the Siderosthen Paint Syndicate, Ltd., of Monier Road Works, Wick Lane, Bow, London, E. For this paint it is claimed that it will absolutely prevent the rusting of the material to which it is applied, that it will stand any degree of heat without blistering, that it will resist the action of chlorine, ammonia, caustic soda, and nitric, acetic, sulphuric and muriatic acids, that it is unaffected by salt air, spray or sea-water, and that it is elastic when dry and will not crack or chip. "Siderosthen" has the character of thin oil paint and is of a blue-black colour. According to some tests made with this paint, it was found that after being immersed in water for a year, a plate coated with it remained unchanged. An iron plate coated with it was, after drying for five days, exposed for two hours to a temperature of about 260deg. F.; the paint first softened and then became hard again. The plate was then immersed in a steam boiler heated up to 320 deg. F., and the paint was found to remain intact. It follows that "Siderosthen" can be used for painting steam boilers inside, and we understand it is found to be of great service in preventing formation of scale. Plates coated with it were unaffected after being subjected to acids and fumes for six months. A peculiar feature about the paint is that it dries from the inside outwards. Its covering capacity is three times that of red lead ($10\frac{1}{2}$gal. will cover 1,200 square yards, the cost being $\frac{1}{4}$d. per square yard). For railings, girders, woodwork in damp positions, iron casements, underground water pipes, and general sanitary work, it should prove of great value, as rust makes great havoc and causes much expense. About eighteen months ago "Siderosthen" was used for painting the girders at the west end of Westminster Bridge Station and has stood the sulphur fumes most satisfactorily. The Crown Agents for the Colonies, several leading railway companies, and numerous large firms throughout the country, are using it, so that the paint does not come before the public with unsupported claims. It will preserve wood from the ravages of white ants, which should make it specially suitable for the colonies, where these pests do so much damage. Where another colour than black is required, an isolating paint can be used in red or grey, over which linseed oil paint can be applied as a finishing coat. Linseed oil paint will not adhere directly to "Siderosthen."

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
		BUILDING—		
Nov.	10	Rogerstone—Footbridge	Parish Council	T. Rees, Engineer, Corn Exchange-chmbrs., Newport, Mon.

PRESS OPINIONS.

THE ENGINEER" says of No. 4:

"The field embraced by this issue appears to grow with each half-yearly issue. No. 4 contains over 700 pages, and we note that the compilers are alive to the necessity of collecting together in separate divisions all information, although not quite of a kindred nature, yet likely to be sought for by men of a particular profession. For instance, 'Hygienic Engineer,' 'Roadmaker,' and a new miscellaneous section have been incorporated into one division, entitled 'Municipal Engineer.' The labour involved in the production of such a publication must be immense, and it is to be hoped that it will meet with a commensurate reward."

"ELECTRICITY" says:

"SPECIFICATION No. 4 maintains its reputation as an architects' and engineers' compendium. The present issue has been corrected and brought up to date, and yet further enlarged. The various sections have been written by men whose names are a guarantee for their thoroughness."

"THE SURVEYOR" says:

"It is really impossible to give an adequate idea of the book by means of a notice. It is a professional library in one volume, and its scope and value can only be properly appreciated by an actual examination. We are safe in saying that to see it is to feel a strong desire to possess it. There is a strong list of contributors, and the numerous illustrations form one of the strongest features of an excellent compilation, the production of which must have involved no small labour. There are over 700 pages, and the price is only 5s. nett."

"THE IRONMONGER" says:

"The work will be found of great value."

"ENGINEERING" says:

"The remarkable publication, 'Specification.' . . . . . . should prove extremely useful."

Strand, W.C.

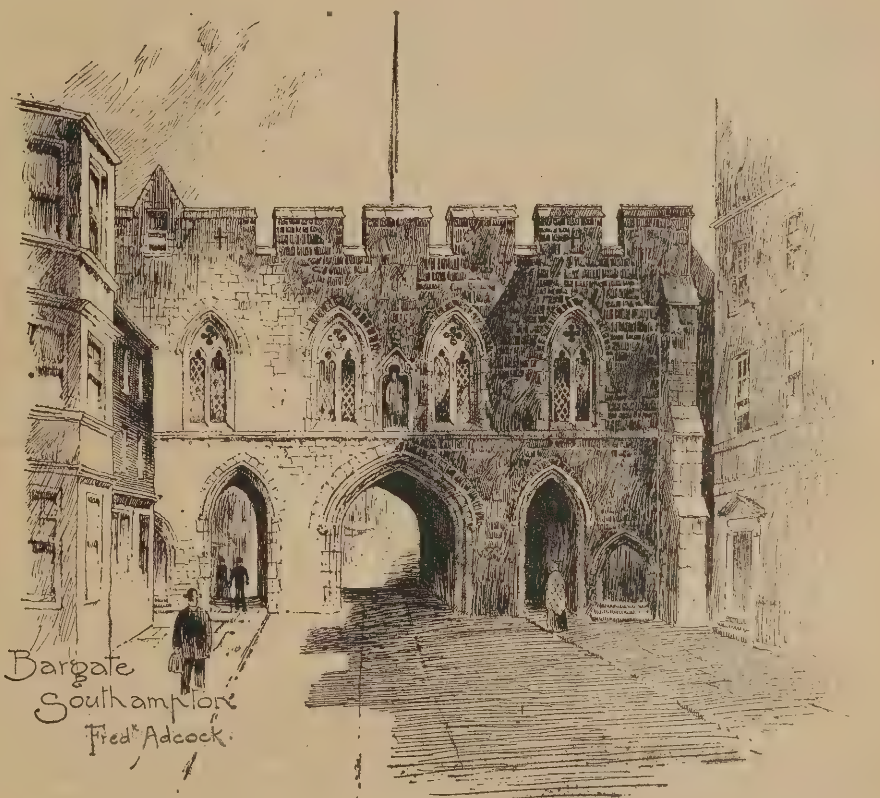
An Architectural Causerie.

The Study of Old Work. What is the object with which we study old work? Is our object to copy or to understand? Some people of course go so far as to say that old work should not be studied at all; yet their work often shows prominently the influence of the old masters, both in form and, still more, in spirit.

Of course, the obvious and natural idea of a Renaissance is that it should be an imitation of ancient work, not necessarily in defiance of new requirements, but still an imitation. Palladio measured Roman remains that he might reproduce the orders with their correct proportions in his own buildings. The architects of the fifteenth and sixteenth centuries did not trouble themselves very much about the purposes of ancient buildings, their origin, and developments; the imposing results were sufficient, and those they measured in order that they might copy. The same conception of ancient art comes out very clearly in old Italian collections of sculpture, such as that in the Vatican, especially if we compare them with a modern one, such as that in the British Museum. In the early collections judgment is given, so to speak, on results; the finest works are collected together in some "Tribune," irrespective of their style, or the date at which they were produced. In a modern gallery the works are arranged according to their dates or their schools. We are interested to see what influence each master owes to the one who went before. Old collections were for the instruction of artists and connoisseurs the more beautiful work was the one to study. Modern galleries are places rather for the historian of art; such a work inspired such another. Here we recognise the style of one school, here of a second; so a historical and scientific interest has come to qualify our sheer admiration of a work of art.

The conception that ancient buildings were so many storehouses of designs for modern ones went on gathering force right up to the Gothic revival, and the Gothicists inherited it in its full strength. Instead of measuring temples and baths they measured churches and halls, and reproduced them in their own work. But it was soon found out that mediæval buildings were not only beautiful and imitable, but intelligible and interesting; so that architects and antiquaries sought not only to know the buildings, but to know about them; when they were first put up, how altered, and what were the uses of the various parts. Modern archæology has reached enormous limits, so that there is hardly anything in the social and religious life of earlier ages which it does not touch. Among the many accomplishments that an architect is required by the public to possess, is a sound knowledge of archæology. And this was fair enough in the days when architecture was frankly an imitative art and archæology an acquaintance merely with the relics of antiquity. Of course, if an architect was to imitate it would be well for him to be familiar with the best models. But, now, though architecture may still be an imitative art—it is so regarded by the public at large, especially I think, by the cultivated part of it—the architect's old conception of archæology is quite antiquated. Research has shown the way to so wide a field that a mere acquaintance, however close, with features that we can copy hardly counts for archæology at all. Yet, is the architect to shut himself out from all this interest? Is he to refuse to trace the outline of a refectory on the site of an infirmary that he may devote himself to sketching Gothic windows on the cornices of Georgian houses? This is in fact the question which has puzzled our humble sketcher; in brief, is archæology any good to an architect? Everyone will answer this question in his own way. The writer's object is not to provide an answer to it, but to point out how mistaken is the notion that architecture and archæology are the same thing, even granting that architecture must depend for its inspiration upon the past. To those who admire as much as the writer the straightforwardness and simplicity which the mediæval builders show throughout their work, whether it be elaborate or plain, whether in the decoration or arrangement, it will be difficult to think that archæology is not of the greatest indirect value to an architect. But many people will think otherwise. Certainly its direct value is not obvious, and perhaps a single brain can hardly carry all the attainments which might have an indirect bearing on the practice of our art.

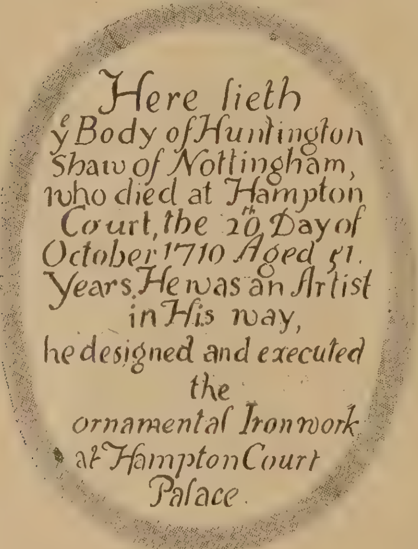
E. B. S. S.



Bargate, Southampton. The fine old gateway at Southhampton, which divides the High Street into two portions—Above and Below Bar—was formerly the northern limit of the town. It was at one time protected in front by a broad ditch; beyond this a "fore-gate" suburb sprung up, which has gradually become connected with the rest of the town. The lower stage of the gateway is composed of a central arch with a smaller one on each side. The central one appears to be of the early English period, but the smaller ones are of a later date. The upper storey on the south side, as shown in the illustration, has windows of the decorative period, which are a modern restoration to something like the appearance of the gateway before the "improvements" of the last century, when sash windows were inserted and the interior walls plastered. The statue in the niche above the central arch is of George III., attired as a Roman emperor; it replaces one of Queen Anne which has been moved to the interior of the building. The room over the archway has been used as a Court of Justice since the reign of Queen Elizabeth. In spite of the various alterations, this beautiful old gateway still remains one of the finest examples of the kind in England.

F. A.

"An Artist in his way." This is a phrase contemptuous alike of the artist and his work, of artistry and of the artistic career, a phrase whose implied slight, even unaccompanied by the intentionally offensive intonation, places the man so characterised as of little account among his fellows, and his calling as one to be sneered at, or patronised by every respectable tradesman. It is, in short, the phrase that fills the mouth of the estimable commercial man when he is discussing the artist in paint, in architecture, in sculpture—the artist, in fine, in all media; and it carries with it an undefined sense of superiority assumed by the user of it. It might, perhaps, be thought that this is a phrase of modern mintage; and indeed it carries a specious air of modernity that might be calculated to deceive the most expert in recent vulgarisms; but we have happened upon a relic which embodies it and proves that nearly two hundred years ago the Philistine flourished exceedingly. It is a relic interesting in itself and valuable as a text on which to hang this discourse. It may be found at Hampton-on-Thames, in the church, and is in the shape of an oval medallion on the wall, with the quaintly lettered inscription shown in the accompanying illustration. The name of Huntington Shaw is one familiar to the architectural profession, for, as this epitaph incorrectly tells us, he was long thought to be the designer of the beautiful wrought-iron gates at Hampton Court Palace as well as the craftsman who fashioned them. The belief that he designed these remarkable gates is now an exploded one, and a Frenchman, a certain Jean Tijou, a well-known designer of that period, is known to have been officially employed on such decorative details at the Palace. But if it is certain that to Jean Tijou's rich fancy we owe this florid design, it is also no less certain that it is to the skilful craftsmanship of Huntington Shaw we are indebted for the translation of the Frenchman's fancies into actual solid facts, in the stubborn medium of iron. He was, indeed, "an artist in his way," as his epitaph says, and much more an artist than that slighting form of words would seem to allow, even while crediting him with more than was his due. Art, you see, was even then in the ordinary mind commonly restricted to the category of painters. The great galleries of that riverside Palace were hung with the works of Old Masters and with those of contemporary painters. Those painters were men of very varied calibre, but they all employed brushes upon canvas, and so all were "artists." The walls and ceilings, too, of the Palace were even then being decorated with what Pope, or another, calls "The sprawling nymphs of Verrio and Laguerre," and Laguerre and Verrio, too, were "artists." Shaw, however, wrought at the forge, and smote and hammered iron, and was probably looked upon as little better than a kind of glorified blacksmith, so that even those who erected his memorial, and who cannot be accused of wilfully under-rating him, only conceived of that wonderful craftsman as by way of being of that dignified company. That, even nowadays, there are those who deny architecture as an art, is perhaps sufficient proof that, to the crowd, the most gifted of architects and decorators are only, at the utmost computation, "artists—in their way." C G. H.



Here lieth
y^e Body of Huntington
Shaw of Nottingham,
who died at Hampton
Court, the 20^{th} Day of
October 1710 Aged 51.
Years. He was an Artist
in His way,
he designed and executed
the
ornamental Ironwork
at Hampton Court
Palace

On Reflection.

The March of Engineering. Though one expects it from men in exalted professional positions, the manner in which the presidents of our great societies and institutions acquit themselves at their inaugural sessional meetings is highly satisfactory. They supply much food for thought, striking out now and again into new paths, and, as in the masterly address given this year by the president of the Royal Institute of British Architects, reviewing the work of the past—be it years or months—with the voice of authority and experience. The address which Sir Douglas Fox (the new president) recently delivered at the opening of the eighty-first session of the Institution of Civil Engineers was of this class. There was certainly much matter for thought. Though what our foreign friends say of us is largely due to old-time prejudices, accentuated by modern jealousies, it is impossible to deny that innovations meet with great opposition in this country. As Sir Douglas said with regard to electrical traction, lighting and power, while the development of these great utilities is here hedged in by legislature and encumbered by regulations and by-laws, in the United States, Germany, Switzerland, Japan, and even our colonies, electricity is so universally used that the comparison is very discouraging to us. See how we stand with regard to electric railways. What an exception they are in Great Britain. The Metropolitan and Metropolitan District Railways of London have only just begun to experiment on a question that has long been decided in America—that of the electrical haulage of heavy trains combined with rapid starting. After referring to the complete revolution in the sanitary engineering of towns and villages during the century, and to the present unsatisfactory state of the London water supply, Sir Douglas Fox emphasised the conclusion of Sir J. Wolfe Barry that the metropolis would have to form new thoroughfares and widen the existing ones. We have often decried in our columns the narrowness of some of the London main streets, and pointed out how glaringly insufficient they are for the great stream of traffic which passes over them. This is a subject which has been talked about for many years, but something will really have to be done shortly. The president is evidently not nervous about the future of gas, which, since the days when Murdoch startled the inhabitants of Redruth by employing it for house lighting, has made great progress. With the statement made by those who foresee the age when all the coal dug out of the earth will go into retorts to provide a source of heat or light, "so that there will be no more fogs and no more waste of useful by-products," some will no doubt disagree; for, when engineering is in a state of constant advance it is certainly hard to define what will be the condition of things in future years, and many theorists are zealous in emphasising that a new invention may upset all former axioms and definitions. Therefore, prophecy needs to limit its vision.

Looking Ahead. Still here is the vista of the future as set forth by Sir Douglas Fox:—"May we not look forward to a time when horses shall have given way to mechanical traction, avoiding offensive smell, reducing noise and wear and tear, and enabling asphalte pavement to be used throughout with cleanliness and safety; when the cooking and heating of the town shall be effected, if not electrically, at least from gasworks situated in the neighbourhood of the collieries; when the fog-producing marshes of the East shall be thoroughly drained and dried up; and when an efficient ventilation of sewers shall prevent the escape into the thoroughfares, especially in the higher parts of towns, of the foul gaseous emanations of the mighty sewage flow beneath." The present is, perhaps, a fitting opportunity to point out a matter which has often been greatly deplored by architects. Without exhibiting what might in any way be called jealousy, envy, or pettiness, is it not fair to ask why the newspaper press and the public (as a result) give so little attention to architecture and architects? Their work is of equal importance to that of the engineer, yet, as an example, see what space has been devoted, and what prominence given to the opening meeting of the Institution of Civil Engineers as compared with the opening of the Royal Institute of British Architects. Public applause is not what is asked for, but simply that attention which the architectural profession deserves, in order to show that it is, indeed, a great and a living force in the nation's life. Too long has the architect been left in the shade; it is high time that his position was more fully recognised.

A Word About Patents. Three thousand years ago the wise man said that of the making of many books there was no end, and his utterance may very well be employed with regard to the number of patents taken out at the present time. It is amazing to see the long list of patented inventions that are introduced yearly, and there is no doubt whatever that the supply is largely in excess of the demand. The greater number of those who take out patents are really not competent to do so. As the result of false and silly representations of tiny articles or simple devices having brought fortune to their inventors, thousands have been led to exercise their inventive faculty in the attempt to follow suit, and in the majority of cases it were far better, both for themselves and for everyone concerned (the patent agent excepted) that they had devoted their time to something more profitable. To come nearer home, look at the number of sash fasteners, water closets, windows, fireproof floors, saw guards, lock nuts—to mention just a few—for which patents are taken out every week. Thousands of building patents are lodged annually at the Patent Office, but how many of them ever come on the market, how many are of any real practical value? It is true that small inventions, requiring little prior art on the part of the inventor, have proved valuable, but it is also true that in lotteries someone receives a large sum for a small outlay; yet lotteries are recognised as demoralising influences. The same might be said of patents. The real inventor is he who first satisfies himself that there is a need for his invention, and who then makes a thorough search of all the devices of those who have preceded him; unless he does this he will probably find that his idea is valueless or that it has already been exploited by another. The American Government Commissioner of Patents forcibly pointed this out some time ago; he said "the valuable inventions are those which are the result of hard work, careful study, and experiment by those who have familiarised themselves with what others have done and with the real needs of the art. The careful student does not always produce inventions of value, but he is at least not likely to merely reinvent what is already known, what is already before the public, either adopted by the public or tested and thrown aside as worthless." This well considered and common sense advice should be taken to heart by the would-be inventor. A little of the leaven of experience, and a short acquaintance with the Patent Office records, with their stupendous list of inventions, would soon drive him away from the inventive field, or rid him of conceits and make him more fit to develop his idea.

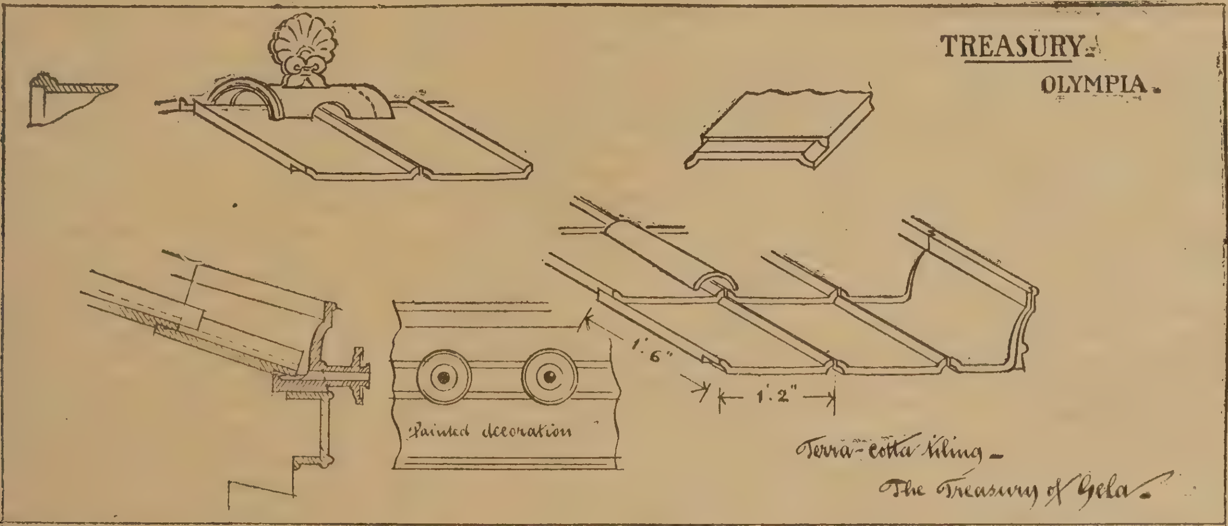
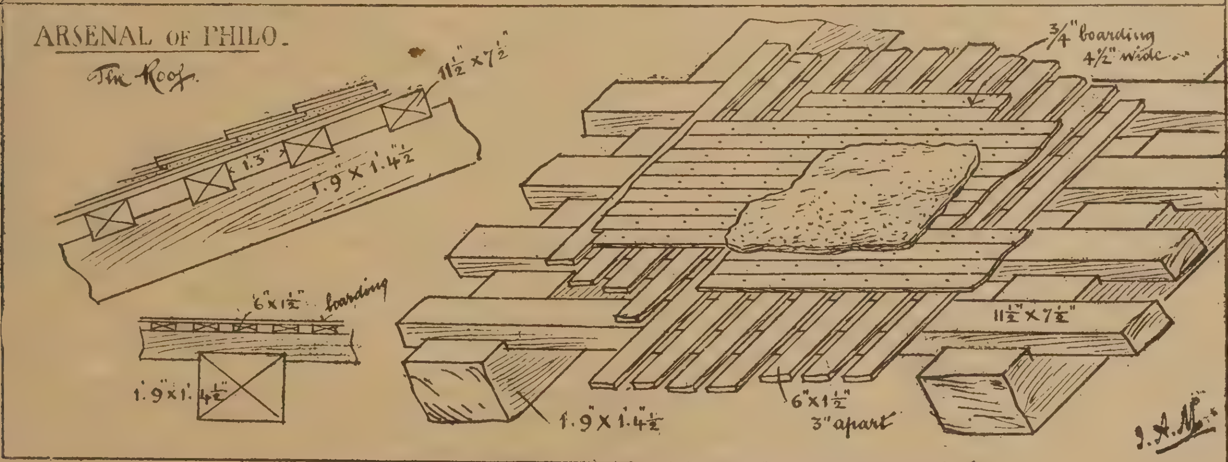
> "*At last he rose, and twitched his mantle blue;*
> *To-morrow to fresh woods and pastures new.*"
> —Milton.

HAVING now followed the various stages in the erection of a Greek temple, from the foundations to the cornice, it only remains to consider some of the general methods employed in the treatment of the roof tiling.

Until the early part of the sixth century, B.C., clay was probably the only material used for Greek tiles, and to make it impervious the terra-cotta was sometimes coated with a glaze. The invention of marble tiles not only increased the durability of the roof covering, but ensured a uniformity in the material employed throughout the exterior of the building; occasionally, however—from a motive of economy, or to limit the weight—the marble tiles were confined to the eaves and pediments, the rest being of burnt clay. In the islands of Naxos and Paros the making of marble tiles seems to have been a regular industry; the marble for the original tiling of the Temple of Zeus, at Olympia, came from one of these islands, but in Roman times it was replaced with tiles of Pentelic marble.





These were the tiles noted by Pausanias when he visited Olympia in the second century, A.D. After recording that the architect of the temple was Libon, a native of Elis, he points out, as worthy of note, that "the tiles on the roof are not of baked earth, but Pentelic marble, to imitate tiles." "They say," he continues, "that such tiles are the invention of a man of Naxos, named Byzes, who also made statues. This Byzes was a contemporary of Alyattes, the Lydian, and Astyages, the King of Persia." The marble from Naxos and Paros when in thin slabs is very translucent, and it has been suggested that this quality might have the advantage of causing the interior roof space to be fairly well lighted—assuming that the tiles were laid directly on the timbers without the intervention of boarding. In some cases it is certain that special provision was made either to light, ventilate, or gain access to the interior of the roof by perforating some of the tiles, and providing them with covers fitted over a curb or rim; such tiles have been found at Olympia, Phigaleia, Tegea, and Athens.

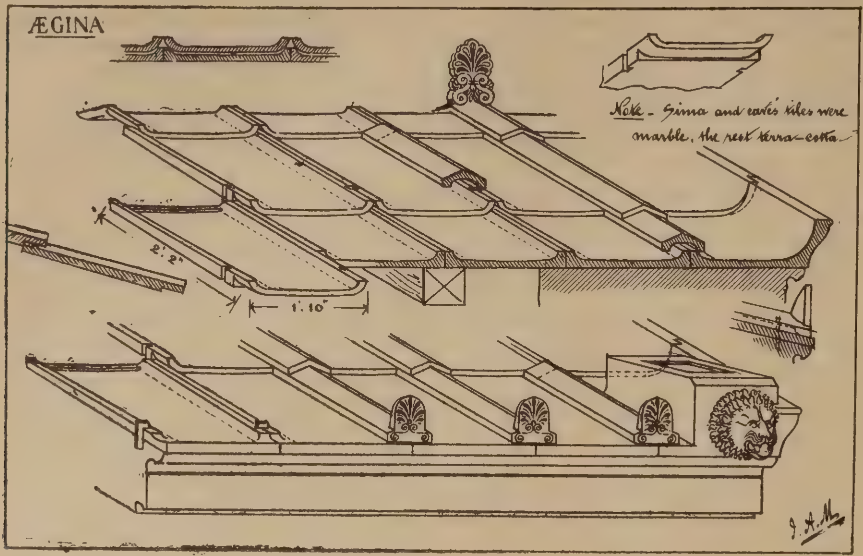
That the tiles did not always rest on the rafters is evident from the description of the roof given in the specification for the Arsenal at Zeia, in the Peiraic peninsula. It will be remembered that this building was divided into three aisles by two rows of columns; the columns were 11ft. from centre to centre, and 30ft. high; on the top of each colonnade were placed epistylia, or beams of timber, 2ft. 6in. wide and 2ft. 3in. high, each extending over two intercolumniations. Across the central avenue were tie beams of the same scantling as the epistylia. A propping block, 3ft. high and 1ft. 6in. square, was fixed in the middle of each tie beam, to support the principal rafters at the apex. These rafters were 1ft. 9in. wide and 1ft. 4½in. deep; they were secured to the ends of the tie beams with stout pins, and thence extended to the walls. On the principal rafters were placed longitudinal timbers, or purlins, 11½in. wide, 7½in. thick, and 1ft. 3in. apart; and on these, again, planks, or common rafters, 6in. wide, 1½in. thick, and 3in. apart. The rafters were covered with ¾in. boarding, nailed on in widths of 4½in., and on this was laid a preparation of some kind—perhaps loam or mortar. The roof is specified to be tiled with "Corinthian" tiles, fitting closely; these were probably of terra-cotta and bedded on the mortar.

There was no independent ceiling, and to light and ventilate the building a window was provided in each bay, and three at each end, 3ft. by 2ft., and fitted with bronze shutters; narrow openings were also left here and there at the vertical joints of the walling.

Respecting the bed of loam or mortar for the tiles, it may be mentioned that the German archæologists seem to have accepted this method as of general application, judging from the restorations in their work "Die Baudenkmäler von Olympia."

The Greek roofing tile may be briefly described as a shallow tray, with rims on two sides, to keep the water away from the joints as it runs down the roof. The underside was flat, excepting the overlapping part in front, which was shaped to fit closely over the rims and to the concave surface of the tile below; this part was also "throated," or undercut, to prevent the water being driven under, and as a further precaution, a slight roll or fillet was generally formed on the top surface of the tile, at the back, where it was overlapped by the "throated" portion of the tile above. To cover the joints at the sides, narrow tiles, saddle back in shape, were placed over the rims, and overlapped at the ends, like the rest of the tiling. When the eaves tiles included in their length two or three of the ordinary tiles, stops were worked on the eaves stones to receive the ends of the intermediate cover tiles; and in Doric buildings—where the sima was generally omitted on the flanks—the raised rims at the joints of the eaves stones were stopped short of the front edge, so that the antefixa, or anthemion, at the end of each cover tile could be bedded as a solid block, to conceal the rims, and be dowelled to the eaves stones; but if the eaves stones had a sima, which formed a gutter, as in Ionic buildings, then the cover tiles were shaped to fit the concavity of the gutter, and pass over the top edge of the sima, where they were terminated by antefixæ.

The question of how to finish the tiling on the pediments seems to have been solved at a very early period, as is shown by numerous



ÆGINA
Note - Sima and eaves tiles were marble, the rest terra-cotta.

J. A. M.

"archaic" fragments in terra-cotta which have been found from time to time.

The large size of the ordinary Greek tile rendered it necessary to conceal, in some way, the over-lapping at the verge, and this was done by turning up the thin outer edge of the tiles to form a deep sima; and in order to preserve a uniform width on the top edge, the over-lapping of the tiles was ingeniously merged into a rebate, so that the joints of the sima were "flush" on both sides. This elegant method of terminating the roof—as if the undulations of the tiling had culminated in a billow—lost, in the course of time, its refined character, and was eventually superseded by the ponderous coping stones of a later age. We will now follow our usual plan of briefly describing a few examples, which may serve to make the foregoing remarks a little clearer.

Treasury (*Olympia*).—An early example of terra-cotta tiling; size of tiles, 1ft. 6in. by 1ft. 2in. The rims of two contiguous tiles form a roll, which kept the water out of the joints. Where the tile overlapped it is rebated on the underside to catch the back of the lower tile, and thus was kept in position; the overlapping part is shaped to fit exactly into the tile below and over the rolls. The ridge tiles have socket joints at the ends, and a semi-circular opening in the middle of each side was provided for the insertion of the cover tiles; the latter were made tapering so that they could be more accurately fitted, and be less liable to slip. The sima of the eaves gutter had an outlet in the middle of each tile.

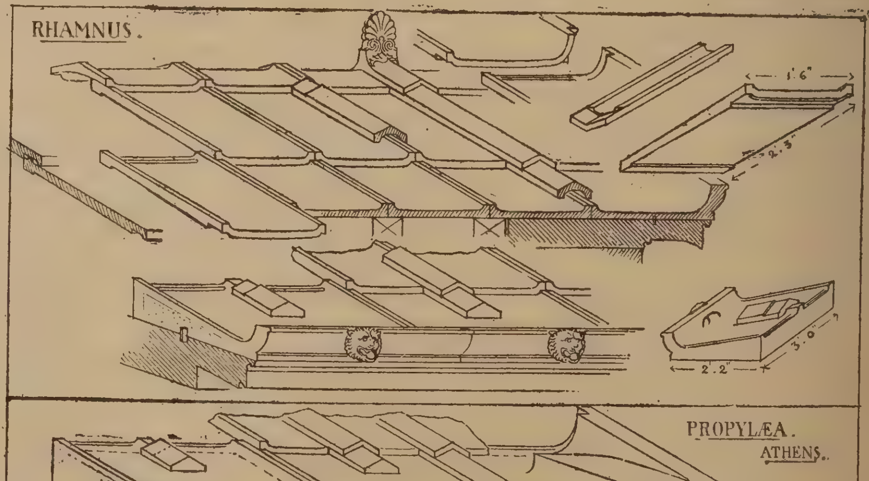
Aegina.—An instance of terra-cotta and marble tiling combined. The eaves tiles, with their cover tiles and antefixæ, also the sima tiles of the pediments, were of Parian marble; the rest of the tiling, including the ridge tiles, being of baked light yellow earth. Size of tiles, 2ft. 2in. by 1ft. 10in. The top surface is slightly concave, and the overlapping part on the underside is curved to fit into the lower tile; there is, apparently, no provision for fitting this part over the rims, and to get room for inserting the overlapping portion the trough of each tile is gradually widened towards the back by tapering the rims; even this expedient would not allow the tiles to fit very closely, but to prevent the water being driven under, a roll was formed at the back of each tile. The tiles were secured to the roof with iron dowels let into grooves formed in the sides, so that one dowel answered for two tiles; the dowels for the eaves tiles projected above the rims to secure, at the same time, the joint tiles and antefixæ. The rims of the eaves tiles stopped short of the front edge to allow the antefixæ to be properly bedded. The ridge tiles agreed with the ordinary tiling as regards the joints and overlapping parts.

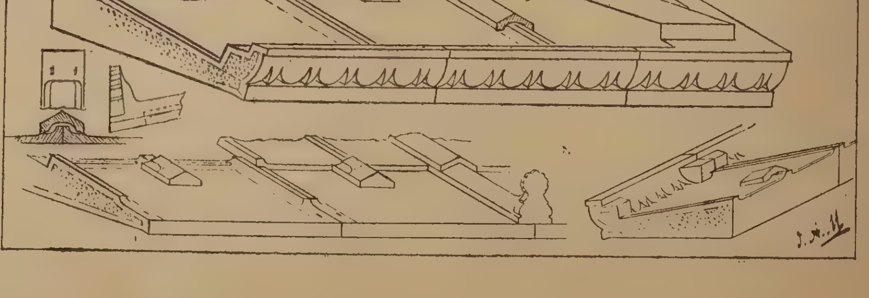
Rhamnus.—The tiling here was of marble throughout. Size of tiles 2ft. 3in. by 1ft. 6in. The front edge of each tile is formed into a throated drip, which passed over a roll at the back of the lower tile, and is shaped to fit into the trough and over the rims at the sides. A fillet at the back, on the underside, secured the tiles to the roof. The eaves tiles comprised two of the ordinary tiles, and the intermediate cover tiles were received by a solid block worked in the middle of each gutter stone. We cannot say how the cover stones over the joints were terminated, but we have seen them shown to abut against the back of the sima, in which case the joint would not be weather-tight.

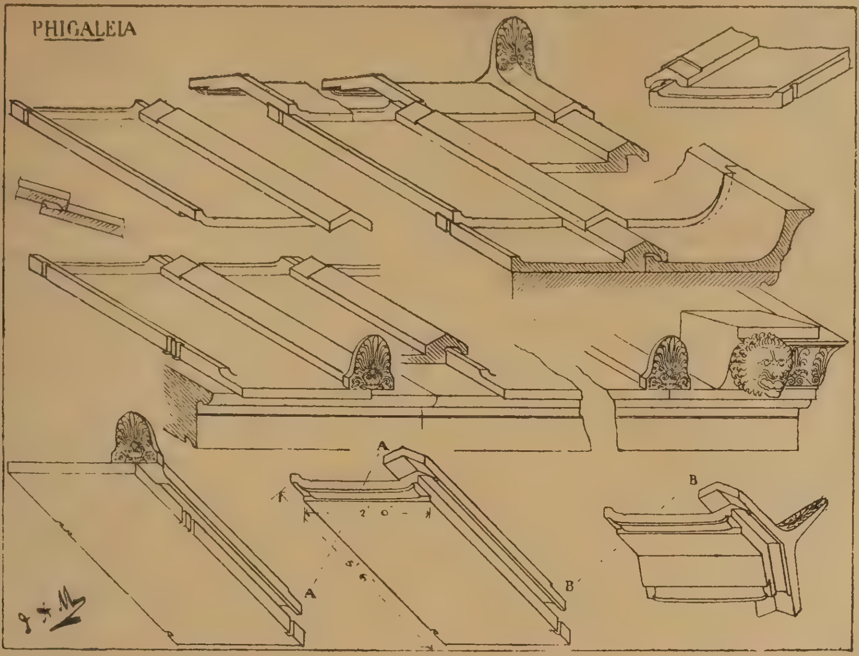
Propylæa.—The eaves of the main vestibules were treated in two ways; for the porticoes, as far as the breaks in the entablature, the eaves tiles were provided with a pierced sima, but for the intermediate portion of the flanks the sima was omitted. On each side of the joints, at the back of the sima, square blocks were left, perhaps to strengthen the sima or to serve as seatings for antefixæ, which may have been worked on the cover tiles. In other respects the arrangements are similar to some already described.

Phigaleia.—The fragments of tiles found on the site of this temple indicate, perhaps, the most perfect system of Greek tiling ever devised; at the same time it will be readily seen that the labour involved in its execution must have been unusually great. The tiles were very large (3ft. 6in. by 2ft. 1in.), and instead of working the covers in the ordinary way, on separate stones, they are worked on the same stones as the tiles. This arrangement would not only tend to make the roof more weather-tight, but it would add considerably to the strength of the tiles, not an unimportant matter, taking into account their excessive length. The ridge and eaves tiles, including their acroteria and antefixæ, were treated in the same manner. To secure the tiles to the roof, iron dowels were let into the sides, as at Aegina. Another instance of combination tiling was found at the Treasury of Sikyon, at Olympia, but here the arrangement was only applied to the eaves. In the "Phigaleian Room" of the British Museum the student may, by careful search, detect some tile fragments at the bottom of a case; and on the wall will be found a considerable length of the pedimental sima, exhibited in a horizontal position.

Ephesus.—Some fragments of tiles, encased in the "Ephesian Room," belong to the later temple of Diana; and could they be minutely examined, they would be found to possess many points of interest. On the wall of the same room are also the well-known fragments of the eaves gutter; the stones for the latter were about 6ft. in length, which probably comprised two of the ordinary tiles. The unusual height of the rims, dividing the gutter at the joints, leads to the conclusion that the gutter was turned up at the back to the height of the rims, so as to form a complete trough, and the first course of tiles would thus be raised some inches above the gutter. This conclusion is strengthened by the peculiar section of the "throated" drip on the first course of tiles, and which is clearly intended to project beyond a vertical face (A). The rims of the gutter stones were made sufficiently wide to receive the covers entirely free of the trough, and a secondary rim was worked on in continuation of the rims of the tiles (X). The cover tiles were, no doubt, turned over the sima, and terminated with antefixæ—indeed, the smooth, unweathered surface at the back of the sima, which was protected by the cover tile, can be traced. The intermediate cover tiles of the first course had "stopped ends," which finished flush with the front edge, and fitted closely to the rims (B). Another fragment (E) has a pad worked on the hollow of the rim, apparently with the object of providing a convex seating for the "stopped end" of the cover tile. The fragment C, which is in the "Archaic Room," has a stop worked on the rim a few inches from the front edge; this was evidently intended to receive a projection on the underside of the cover tile, with the







object of keeping the latter in position; on the fragment D such a projection will be found, and although it is not to be assumed that these two fragments were actually related, yet the principle of the expedient seems to be clearly established.

It will be noticed on fragment C that the rim is abruptly reduced in thickness on the outside, a few inches from the front edge, so that a space would be left between the tiles at this part; a similar peculiarity is also to be seen on some of the tiles found at Olympia, and the reason for it is made obvious by a peg which is worked on the underside of a cover tile (G) to fit into the slot and abut against the rebate.

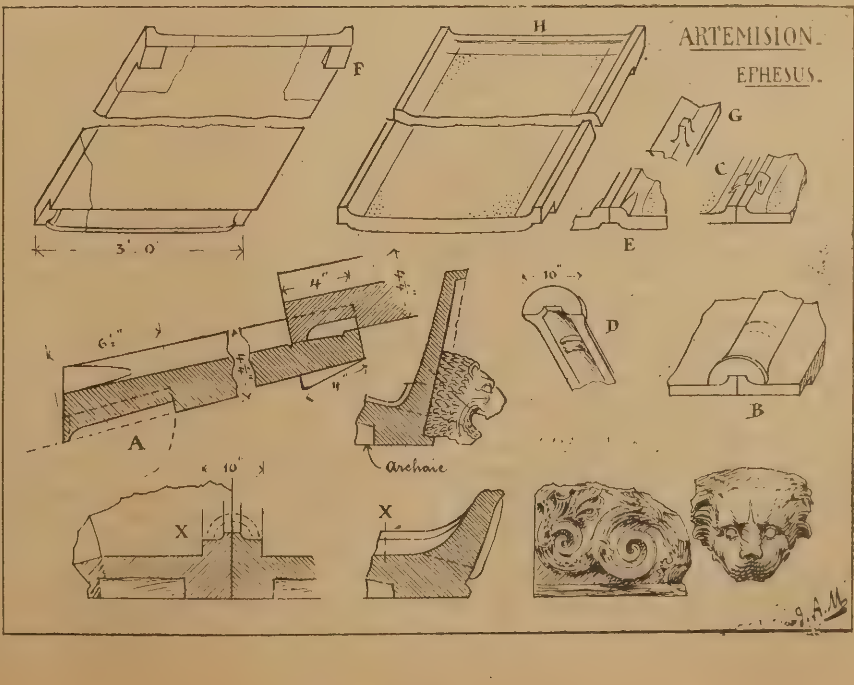
To keep the ordinary tiles from slipping projecting nibs (F) were left on the underside; and, to avoid unnecessary "cutting to waste" when working the tiles, the latter are reduced in thickness towards the back, so that the extreme thickness at the back, including the nibs, does not exceed the thickness in front. On the top surface at the back is an indent (H) to check the water when driven under the drips; the margins, which were protected by the cover tiles, are defined by an inscribed line, and still retain their polish, while the exposed surface is much water-worn.

In concluding this attempt to epitomise for students what is known of the structural qualities of Grecian Architecture, it will hardly be necessary to offer a note of warning against any attempt to revive in these days the details of this architecture; such a course would be quite out of place and distinctly detrimental.

In what way then, it may be asked, can the contemplation of Hellenic art advance the progress of the Modern? For an answer the words of a great writer need only be quoted: "It is the grace of the Greeks, their sense of proportion, their distaste for the exaggerated, their exquisite propriety; it is these that we should endeavour to assimilate without the loss of our own individuality. We should quicken our sense of form by intelligent sympathy with theirs, and not stiffen it into formalism by a servile surrender of what is genuine in us to what *was* genuine in them." To the same effect are the following lines of Goethe's, which he ascribes to that pert rogue Amor, who had followed him to Italy:

Hast thou a mind again to form? The school of the Grecians
Still remains open, my friend; years have not barr'd up its doors.
I, the teacher, am ever young, and love all the youthful,
Love not the subtle and old; Mother, observe what I say;
Still was new the Antique, when yonder blest ones were living;
Happily live,—and, in thee, ages long vanished will live!

H H



DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

By GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

(Continued from page 178, No. CCXLVI.)

V.—CONSTRUCTION OF WALLS.

THE Act does not appear to contain any specific definition of the term "wall." It may be inferred, however, from the general tenor of the first schedule that a "wall" within the meaning of the Act cannot be less than 8½in. thick. In the "Preliminary" part of the First Schedule we read (8) that "walls are deemed to be divided into distinct lengths by return walls, and the length of every wall is measured from the centre of one return wall to the centre of another, provided that such return walls are external, party, or cross-walls of the thickness required, &c." It is evident that external walls can be divided into lengths by other external walls at right angles to them, but I know of nothing in the Act to define the lengths of these other external walls. Suppose, for example, that a building, facing the south, has a frontage of 80ft., and that half of its frontage coincides with the general building line, while the other half is set back 10ft. towards the north. The front external wall is thus divided into two distinct lengths by a return external wall about 10ft. long; or, more correctly, here are two distinct walls connected by a return wall, which forms an efficient buttress to each. But if this return wall were less than 10ft. long, it would form a less efficient buttress; it might be only 9in. long—there is nothing, apparently, in the Act to define its length. If the whole 80ft. front wall had only a 4½in. kink in the middle of its length, would this suffice to make it two separate walls for purposes of the Act, or must it then have the additional thickness required for walls exceeding 45ft. in length? Some surveyors hold that a wall in such circumstances is divided into two distinct lengths only when the outer face of the part set back is not in advance of the inner face of the other part. It is to be wished that we had some more definite rule for our guidance.

What is a Cross Wall?

External and party walls may be divided into distinct lengths by cross walls. Section 5 (17) defines a cross wall as "a wall used or constructed to be used in any part of its height as an inner wall of a building for separation of one part from another part of the building, that building being wholly in, or being constructed or adapted to be wholly in, one occupation." It does not appear that this separation is intended to be anything resembling a party separation; for we read, under the "Miscellaneous" part of the First Schedule, that a cross wall may have openings in it. But what is meant by the "separation of one part from another part of the building?" I have known a district surveyor allow a wall to rank as a cross wall when it was bonded to one external wall and extended far enough across the building to separate two rooms. He said that such a wall fulfilled the intention of the Act by forming an efficient buttress. Another district surveyor has maintained that a cross wall must extend across the entire building, being bonded to a party or external wall at each end. Personally, I prefer the latter view, as more correctly representing what appears to be the intention of the Act, which is to provide a means of separation, both for the purpose of a buttress, and for protection against the spread of fire. But it is to be regretted that there should be any scope for divergence of opinions upon this point.

Recesses in External Walls.

Under Section 54 (2), recesses in party walls are limited to one-half the area of the wall in the storey where they occur; and they are not permissible within 13½in. of the inner face of the external walls; moreover, they must have 13in. backs, and must be arched over where they exceed 5in. in depth. So far the stability of party walls is carefully protected under the Act. But in the case of external walls, which would seem to require more protection, both on account of their being liable to be pierced with openings, and being sustained by floors on one side only, less protection is provided under the Act. Indeed, there is nothing in Section 54, apparently, to prevent an external wall being reduced to 9in. thick for nearly an entire storey. Fireplaces in party walls must, under Section 64 (10), have 8½in. backs, but no definite thickness is provided for the backs of fireplaces in external walls. This is a point which has been frequently disputed between district surveyors and speculating builders of the "jerry" type, the latter delighting in 4½in. backs to fireplaces in external walls. In the absence of any special provision it has always seemed to me that such fireplaces should be treated under the rule in Section 54 (1) (*a*), relating to recessess, and a 9in. back should be insisted upon, in the interests of the public.

External Walls One Brick Thick to any Height.

Subject to certain conditions, it is possible to erect a building of any height, up to 80ft. from the ground to the top of the external walls, such walls being not more than one brick thick. The "Preliminary" part of the First Schedule (7) provides that the height of a wall, for the purpose of determining its thickness, shall be measured from its base; and Section 5 (10) defines the base of a wall carried upon a bressummer as the underside of the course above such bressummer. All that is needed then is first to provide such piers or other supports for bressummers as are required under Section 56 (1), and we may build each storey with its own 9in. external wall carried upon a bressummer at each floor, provided that no storey exceeds 10ft. in height from floor to ceiling. [See First Schedule, Part I. (11)]. I have heard it objected that this method of construction would not be permissible, on the ground that it would defeat the intention of the Act; but I do not think that such objection could be sustained.

Stanchions Built into Walls.

Bearing in mind the great value of space in modern buildings, it is not surprising that architects should seek to economise it by building stanchions into walls. Much can be said in favour of this practice. A stanchion so built in has a buttress on each side of it, which helps to resist any tendency it may have to move in the longitudinal direction of the wall; and, at the same time, the brickwork around it affords protection against the action of fire. But, at the same time, the building-in of the stanchion interrupts the bond of the wall, and tends to impair the wall's efficiency as a tie. I have known several cases in which district surveyors have disputed the right to build stanchions into party, external, or even cross walls. In one instance, a cross wall, extending through the middle of a building from side to side, had the effect of dividing the party walls on each side into lengths of less than 45ft. It was proposed to build stanchions into chases to be formed in the cross wall. The district surveyor objected, basing his objection mainly upon the second paragraph of the "Preliminary" part of the First Schedule:—"Every wall constructed of brick, stone, or other similar substances shall be properly bonded, and solidly put together, &c." On the other hand it was urged that, although the Act contained regulations as to chases in party walls, there were no restrictions as to chases in external or cross walls, and stanchions could be placed in such chases without any infringement of the Act. But the district surveyor maintained that the proposed chases would impair the efficiency of the cross wall as a tie, and that, if the proposed construction was adopted, he would so far consider the cross wall non-effective as to regard the party walls as exceeding 45ft. in length, and as requiring the extra thickness required for such walls, under the First Schedule.

It does not appear that any such objection as the foregoing could have been sustained against placing stanchions in chases in a party wall, provided that such chases, in accordance with Section 60, were not wider than 14in. nor deeper than 4½in., were not nearer than 7ft. apart, nor within 13in. of an external wall; and provided, also, that the stanchions did not support girders carrying walls. Such girders would come within the rules as to bressummers, which have been a fruitful source of disputes and difficulties.

Rules as to Bressummers.

Under Section 56 (1), "every bressummer, whether of wood or metal, shall have a bearing in the direction of its length of four inches at least at each end upon a sufficient pier of brick or stone, or upon a timber or iron storey-post, fixed on a solid foundation, in addition to its bearing upon any party wall or external wall, &c." Remembering that a bressummer is defined, under Section 5 (7), as "a wooden beam or metallic girder which carries a wall," we see that when such a girder bears partly upon a party or external wall, space cannot be economised by recessing a stanchion beneath it into the wall. I have heard it contended that when such a girder bears wholly upon a stanchion which is chased into a party wall, it does not actually bear upon the wall, and that therefore the extra 4in. of support required under Section 56 (1) cannot be demanded. But even here, and in all similar cases, the district surveyor has the whip-hand of the builder; for the section quoted provides that "the district surveyor shall have power in his discretion to require that every bressummer shall have such other storey-posts, iron columns, stanchions, or piers of brick or stone, or corbels, as may be sufficient to carry the superstructure."

Most architects and builders have had experiences enabling them to realise how vexatious the rules as to bressummers may become, if strictly enforced upon all occasions, especially when small alterations are being carried out. It is perhaps to be regretted that Section 56 (1) does not leave more to the discretion of the district surveyor. It seems absurd to build projecting piers under the ends of every rolled joist that is placed in a party or external wall to carry a few yards of brickwork. I have known one district surveyor state that he thought the rule only applicable to girders carrying such walls as are specifically dealt with under the Act, such as external or cross walls, and that in the case of a mere partition wall he would not enforce the rule, unless the girder actually required the additional support. Another district surveyor has been known to state that he did not always apply the rule, even in the case of a girder carrying an external wall, because of the hardships and anomalies frequently resulting from such a rigid enforcement of the Act.

In the construction of shop premises, the space in the front part of the ground storey, where the shop window is formed, is, of course, of the utmost value, and builders are usually desirous to recess the stanchions which support the shop-girder back into the party walls. Chases in such portions of a party wall are, of course, not permissible under the Act; and I have known a district surveyor maintain that the party walls must be built to their full thickness as far as the frontage line, in order that they may fulfil their purpose as dividing walls between adjoining premises, and that stanchions to support shop-girders must be placed against the inner faces of the walls, and not recessed into them. This view appears to me quite in accord with the intention of the Act, although it is far from commending itself to the approval of most persons who build shops.

(*To be continued.*)

George Eliot's House, "The Priory," St. John's Wood, N.W., is about to be demolished to make room for the enlargement of the electric lighting station.

Correspondence.

"GARDEN CITY": AN ARCHITECT'S CRITICISM.

To the Editor of THE BUILDERS' JOURNAL.

TUNBRIDGE WELLS.

SIR,—In your issues of October 5th and November 1st, you called attention to an association recently formed to educate the general public up to the point of founding an ideal city, and in the former notice you reproduce a plan given in Mr. Howard's book "To-morrow," which purports to be a plan such as he would conceive an ideal city might possess. Perhaps you may be able to find room for a few remarks upon the scheme from an architect's point of view, although I would preface my remarks by saying that since reading your notices I have heard Mr. Howard lecture on his scheme and in reply to criticism he seems very ready to admit that his plan is capable of a good deal of improvement. Still, if a man or an association are appealing to the general public to support a particular movement and publish a plan of something they would like to attain, one cannot be blamed for pointing out its weak points.

In the first place I would call your readers' attention to the circular arrangement of the scheme. Leaving out of consideration the improbability of finding in this country a track of sufficiently level country on which a circular city might be laid, it must be obvious to any architect that the objections to a circular as distinct from a rectangular system of laying out a town are very numerous. Anyone who has had the misfortune to live in a crescent will know the objections to houses built on a curve—objections both æsthetic and practical.

It seems to be a natural law that our senses are not capable of taking in an unlimited number of circular lines in a perspective. The materials of building are of such a rigid and inelastic nature that we instinctively feel that all the main lines of our Architecture should be either vertical or horizontal. While we can tolerate or even enjoy the sweeping lines of a dome, or the oblique lines of a roof or buttress, knowing their purpose and fitness, any attempt to multiply the curves of a plan produce a feeling of uneasiness, not to say nausea. The quadrant in Regent Street is an example of a street laid out on the curvilinear plan, which, however inoffensive it may be with all its houses of one pattern, would have been very unsatisfactory if each house had had a separate owner and architect. But when it comes to the practical side of the question, think of the uncomfortable rooms you get when they are rhomboidal in shape, or with curving walls; of the increased cost of building on the curve, of laying drains or sewers along a bending road.

But there is a more important consideration even than appearance. You do not need to be reminded that in laying out streets it is desirable, in order that each house may get its maximum of sunlight, that the street should run as far as convenient in the direction of north and south. It is obvious from a glance at Mr. Howard's plan that only a very few streets in the whole city of concentric rings would have that direction. Allowing, however, for a moment the circular idea, does it not strike you that Mr. Howard's plan wants turning inside out? The Grand Avenue is intended for the larger residences, a magnificent thoroughfare, but I notice it is surrounded at a distance of only 200 yards with a cordon of railways, factories, and workshops, with their endless noise and dirt and smell. The inhabitants of the city would be like a beleagued garrison, open on every side to the attacks of gas fumes, factory noises, engine shrieks, and chimney smoke; never able to escape and gradually driven in upon their central park to stifle. Looked at from the outside at any rate it could never be a beautiful city, and its central parks and gardens could never flourish properly, invested as they would be with this formidable army, nearly four miles in circumference, of smoke producers. But is it one of the essentials of a successful commercial and industrial community that traders and workers should all be in touch with one another, not only connected by railway and telephone but actually near one another? It should surely be a first consideration to concentrate the commercial portion of the town. The more the warehouses, factories, offices, and business premises are concentrated the better it is for trade and the more convenient it is for the general public. And the natural desire to leave the business at the close of the day, and escape in all directions into the surrounding open country should not be despised. Besides which the expansion of a town must necessarily be from the centre outwards and not the reverse, and while the smaller zone of business premises increases slowly, the larger zone of homes increases faster and faster as the prosperity of the community advances. Not that I disapprove of the central open space. By all means in a brand new city leave a big square in the middle like La Grande Place of Bruges, and abutting on that square put all the best public buildings, the town hall, the post office, the fire station, the police court, the exchange, the cathedral, in short, all that represent the serious side of public life. The halls of pleasure and the shops might perhaps be relegated to a secondary position. In Mr. Howard's plan the hospital is placed centrally, in the public park, quietly situated as is right, but it happens to be a mile or more away from every place where an accident is likely to occur, namely, in the industrial part of the town. The central square would, of course, be useful as a meeting place, for civil ceremony and festival, the centre of municipal life. It might be beautified by trees, but certainly should not be a garden. The gardens should be where we can have leisure to enjoy them. But above all, a city scientifically planned might take warning from London and almost every large town and take its railway right home to its heart. To stop the railway on the fringe is surely a mistake. The ideal city should have its railway station close to the centre, from which should radiate a good system of electrically driven cars.

These are some of the criticisms which occur to me in looking at Mr. Howard's plan. But it seems to me that if, as your article announces in bold headlines, we are to have "an ideal city made practicable," we should have some better notion of what an ideal city should be. The idea is and always has been a fascinating one to architects. To have a hand in building an ideal city where the irresponsible speculator and the restricted site and the ground landlord and absurd building by-laws do not exist; where the Philistine ceases from troubling, and the artist may be at rest, is one of our dearest *chateaux en Espagne*. It is heartrending to feel how hopeless we are at present to stem the tide of "uglyfication" which is spreading over the face of the land. Just recently in this country town, famous for its natural beauties, a large wood has been eaten up by the speculator. If Mr. Howard and his influential Association do not succeed in creating a new garden city, but only lead public opinion in the direction of preserving what garden character there may already be in our cities and towns, they will have earned our undying gratitude.—Yours faithfully,

C. H. STRANGE, A.R.I.B.A.

RUSKIN SOCIETY.

To the Editor of The Builders' Journal.

Brondesbury, N.W.

Sir,—Can any of your readers inform me if there is a "Ruskin Society" in London. If so, what are it objects?—Yours truly,

SEVEN LAMPS.

We do not know any such society.

LEASEHOLDERS' NATIONAL COMMITTEE.

To the Editor of The Builders' Journal.

Finchley Road, Hampstead, N.W.

Sir,—The iniquities of the terminable building lease (the foster-parent of jerry building and insanitation) are so flagrant, and the control by the "dead hand," and by non-resident landlords, over the restrictive covenants in leases so unjust, that a "Leaseholders' National Committee" has been formed with the object of obtaining Parliamentary legislation to enable:—(1) Short building leases to be converted into perpetual leases on equitable conditions (such as by a slight increase on the annual ground rent) in order to uproot "jerry building" and kindred evils; (2) Holders of terminable leases to remove their buildings at the expiration thereof, or to sell them to the landlord at an official valuation; (3) The power of the "dead hand" of absentee landlords, and of arbitrary agents, over restrictive covenants in leases to be removed, and the control and revision thereof to be transferred to a "committee of survey," selected from the local county council—the duly chosen representatives of those living in the district, who are alone rightly interested in the arrangement and use of its streets and houses; (4) Landlords to be restrained from appropriating at the end of the lease the goodwill of the business, created or purchased by the tenant, and to secure to the tenant the free sale thereof. It is desired to obtain local committees, of not less than twenty members, in every constituency of England, Wales, Scotland, and Ireland, in order that united action may influence every Parliamentary and municipal election until the above reasonable and urgently needed reforms are conceeded. There is not any fee or payment of any kind required for membership. Full particulars and membership cards will be sent, post free, to any part of the United Kingdom on written application, by letter or post-card, to—Yours truly,

JAMES HAYSMAN, *President,*
"Leaseholders' and Traders' National Union."

Obituary.

Sir Thomas Newenham Deane died rather suddenly on Wednesday last at his office in Dublin. He was born in 1830, and was the son of the late Sir Thomas Deane, architect, of Dundanion, Co. Cork, and was for many years the head of one of the most eminent firms of architects in Ireland. He was a member of the Royal Hibernian Academy, a member of the Institution of Civil Engineers, curator of the National Monuments of Ireland and Ancient Monuments under Sir John Lubbock's Act, and lecturer in Architecture to the Science and Art Department in Dublin. Sir Thomas Deane was the architect of several fine public buildings in Dublin, and took part in the restoration of Christ Church Cathedral, afterwards occupying the position of architect to the cathedral authorities. He was knighted in 1890, on the occasion of the public ceremony of opening the Science and Art Museum and National Library of Ireland, of which buildings he was the architect, in association with his son, Mr. Thomas Manly Deane. Sir Thomas Deane married, in 1851, Henrietta, daughter of Mr. J. Manly, of Ferney, Co. Cork.

Mr. Thomas James Flockton, senior partner in the well-known architectural firm of Messrs. Flockton, Gibbs and Flockton, of Sheffield, has died at the age of seventy-five. As a young man he came to London for a few years in the office of Sir Gilbert Scott, and being contemporary with the movement, took up with enthusiasm the Gothic revival. After being in business with his father, Mr. William Flockton, he started for himself and combined later with Mr. Gibbs, the firm receiving its present title three years ago when Mr. Charles B. Flockton was admitted. The deceased Mr. Flockton did a great deal of church and public work, was adviser to the Sheffield Corporation for the great street improvement scheme commenced about 1872, was the first president of the Sheffield Society of Architects and Surveyors, a F.R.I.B.A., and at one time had a seat on the council of the Institute.

Under Discussion.

CHELMSFORD A MILLION YEARS AGO.

It will surely be admitted that Mr. W. H. Shrubsole, F.G.S., F.R.M.S., by taking this one, chose a very startling title for his recent lecture at Chelmsford. The Mayor (Councillor Taylor), who presided, said he should be glad if Mr. Shrubsole could tell them where Chelmsfordians obtained water a million years ago, and whether it was possible to have water without paying rates. A view of the High Street at that time would also be interesting, so that they might find out whether there were obstructions then and how they were dealt with. Mr. Shrubsole showed upon the screen a section of the ground beneath Chelmsford, and stated that about 400ft. down they came upon chalk, and they might go hundreds of feet deep without getting to the end of this bed of chalk. This chalk, too, was spread over a large portion of England, and it had been proved that whenever chalk existed in an unmoved condition there, at some time or other, had been a broad ocean. Chelmsford had been at one time nothing but an indistinguishable spot in mid-ocean. Geological changes were still in progress, although the earth had lost the fire and ardour of its youth. Changes would probably go on for millions of years before the earth became unfit to sustain life. They might comfort themselves with the assurance that this good old earth would serve their purpose, and would last quite as long as they needed it as a place of habitation. The local water question seems to be the cause of much anxiety to the Mayor, for after thanking Mr. Shrubsole for his lecture he said he only hoped that when they touched the chalk at Chelmsford they would be happy in finding water.

AN INDIAN ON ART.

Mr. Sasi Kumar Hesh, an Indian artist, described his artistic experiences on the Continent and in this country in a paper which was recently read at the Imperial Institute under the auspices of the National Indian Association. By the aid of local patrons—principally that of Maharajah Mymensingh (how curious the name sounds in English ears)—he was enabled to pursue his artistic studies for three years in Rome, Paris, and London. He described the effect produced on his mind by examples of ancient art in the galleries at Rome, Florence, Paris, and elsewhere, and how his views widened and his experience deepened with the study of modern Italian, French, and German art. Coming last to the Royal Academy exhibition in London he confessed to considerable disappointment. Leaving aside Sargent, Herkomer, Orchardson, Collier, a few portraits by Shannon, and some landscapes, he found little in the exhibition worth notice. The work of John Sargent came up to his highest expectations, and that painter might fairly take his stand with such masters as Rembrandt and Velasquez. The chief characteristic of modern art was intense realism, and this was a source of danger the reality of which was evident in certain phases of French art. The danger lay in the lack of the ideal, without which the real became meaningless and inane. The ideal of the Greeks was physical perfection and beauty, and with Christian civilisation came another influence. But physical beauty was no longer conceded to be the highest ideal, and science had loosened the hold of the supernatural on the human mind. Modern art needed a new ideal, and where was it to be found?

ARCHITECTURAL PRACTICE 200 YEARS AGO.

At a recent meeting of the Architectural Association of Ireland Mr. T. E. Hudman delivered a lecture on "Architectural Practice 200 Years Ago." He mentioned that Vitruvius, who practised in Rome during the reigns of Augustus and Julius Cæsar, where there were seven hundred other architects in practice, was the greatest of architectural writers. The dull apathy towards all things artistic which followed the austerities of the Cromwellian period was followed by a re-awakening on classic lines, based on Vitruvius and Palladio. Up to the beginning of the eighteenth century architects were more like artists, and were frequently painters, sculptors, and silversmiths; they only supplied the sketches, and in large works superintended the making of a model to scale. The details were entrusted to a master builder, whose office was on the lines of the present day clerk of works, and it was owing to this that so many buildings showed such weakness in detail, though the general design showed evidence of skill and thought. Architects did sometimes superintend their buildings, but in those cases they were called surveyors, and generally held appointments as such to some public body. At the commencement of the eighteenth century architects and surveyors separated, and formed dual professions, and building work gradually worked its way into the system now in vogue. This was partly due to the enormous increase of building in London, consequent on the Great Fire of 1666, and also to the fact that in the time of Charles II. a series of legislative enactments came into force, which compelled buildings to be erected with some conformity to laws regulating stability and quality of materials, and called into being a staff of officials whose business it was to see their laws carried out. Those Acts had been repeatedly repealed and amended, but they remained for all that the by-laws regulating buildings now in force in the Kingdom.

IN SOME OLD GARDENS.

The members of the Birmingham and Midland Institute heard a very good lecture on "The History of Gardens" at their last meeting. Mr. Albert Forbes Sieveking gave the history very fully, beginning with the Garden of Eden and such ancient gardens as the hanging gardens of Babylon. Of the gardens of mediæval and modern Europe, however, he was able to give most circumstantial accounts from old writers, with sufficient lantern views from their books to furnish a lecture on the art of engraving. The masterpieces of the old French gardeners, the semi-oriental gardens of Moorish Spain—whose nearest kin are the gardens of Persia—and some lovely and famous old Italian gardens were beautifully illustrated. Speaking of Versailles, the most celebrated of French gardens, perhaps of all gardens, the lecturer mentioned that the fountains cost £200 an hour to work, while from first to last the gardens cost £8,000,000. The Tudor gardens of England, illustrated by woodcuts and by a small survival at Hampton Court, received due honour; and the Dutch garden, both at home and as naturalised in England after the arrival of William and Mary, was splendidly illustrated in the latter case by, among others, the Hampton Court gardens as they were in the days of Queen Anne, with their ingenious geometrical parterres and terraces, and long lines of clipped trees. So the lecturer proceeded, showing how Pope, by his writings and his garden at Twickenby, prepared the way for modern natural and landscape gardening, whose rise through the "sentimental" and "zigzag" styles was carefully and picturesquely traced. Some old Oxford and Cambridge College gardens, Vauxhall in its most famous days, Chatsworth, Esher, Melbourne, and other famous gardens associated with "the stately homes of England," Fred Walker's picture painted at Brockenhurst, known as "The Lady in the Garden," and several of Mr. Elgard's pictures of gardens at home and abroad were made use of as illustrations to the lecture. Kent's adherence to nature to the extent of planting dead trees was humorously referred to as a distinct case of "laying out." The lecturer concluded by pronouncing for a judicious eclecticism. The formal garden, whose designs were architectural in their origin, was best for use near the house; then the design should pass by a harmonious transition from complexity to simplicity, through the flower garden and the fruit garden to the orchard, to the park or landscape garden, and so on to the country and the natural scenery—an unbroken sequence from fine art to the wildest nature.

ELIZABETH'S LONDON.

Many curious statements were made last Wednesday by the Bishop of London at the meeting of the London Reform Union. He said he had known an old lady in North London who lived to be 105, and she could remember going in her youth to see the cows milked in what was now Finsbury Circus, and then walking across the fields to the village of Islington. St. Martin's-in-the-Fields told by its name its remoteness. Westminster was a village grouped round the royal palace there. On the other side of the river was the little ward of Southwark. There were fogs, but no smoke. The growth of London was just beginning, and continued, in spite of all attempts to check it. But the Londoners lived in London, and all villadom was unknown. The merchant lived at his place of business, and in the same street as the workmen or the lord. The streets were either torrents of dirt or paved with black mud; coaches were introduced in 1564. The Thames was the silent highway of London, and 2,000 wherries plied upon its waters. One bridge only spanned it, and that led into Southwark. At the time of Elizabeth the Lord Mayor's Show existed in much the same way as at the present day, save that the Lord Mayor went to Westminster in his barge. The water that Londoners drank in Elizabeth's day came from the Thames, and from conduits fed by streams from the northern hills. In the time of James I., the question became a difficult one, and it had remained a difficult one ever since. The houses were built of timber and of plaster. They were as a rule of two or three, and occasionally, as in Cheapside, of four storeys, and the upper storeys overhung the lower. In a street of some width the effect of such buildings was no doubt picturesque, but most of the streets were narrow lanes, and the projecting buildings almost met at the top, making the passage below gloomy and dark. The great glory of London was St. Paul's Cathedral, designed on a scale worthy of the dignity of the City, being 690ft. long by 130ft. broad. It was adorned with tombs and monuments which gave an epitome of civic life. These all disappeared in the Great Fire. The nave was a place of fashionable resort and was known as Paul's Walk, only the choir being used for Divine service. Outside the cathedral St. Paul's churchyard was mainly occupied by booksellers. The other great place of resort was the Royal Exchange, built by Sir Thomas Gresham and opened by Elizabeth, who gave it its name. The lecturer said he could not describe the lighting of the streets, because they were not lighted at all. It was a day of hard-headed and long-headed men, who were keen after business and after profits; indeed, he was not sure that as many "secret commissions" were not taken then as now.

THE PRE-RAPHAELITE MOVEMENT.

There was a large attendance at the New Gallery, Regent Street, W., last Friday evening to hear Mr. H. Wilson deliver his lecture (the second of the series instituted by the Arts and Crafts Exhibition Society) on "The Pre-Raphaelite School in relation to the Revival of Design and Handicraft." The old workers, he said, had their heart in their work, they had their own traditions, and strove to produce what was intelligible to the common people. Then, at the end of the fifteenth century, came the first influence of that passion for classical learning which afterwards changed Gothic England into Classic England, when the early beauties of the national work were veiled by a foreign tradition. The old spirit, however, showed clearly through the veil, but after two centuries had passed the workers had forgotten the ideals of their ancient predecessors, and their works were dull and foreign, and without creative merit. Yet even at the beginning of the present century there was some of the true spirit surviving, needing only a worshipper to revive it; such a man was William Blake (born in 1757), whose influence it was hardly possible to overestimate, a man possessing grand imagination and great creative powers. Though living in a time when the old training and tradition had disappeared, the very incompleteness of his works, due to a lack of education, has a charm which is not possessed by the productions of lesser men with greater skill. In thinking of Blake we should not forget his master, Basire, who had done so much to enlarge the spirit of his pupil's efforts. In all noble art it is the inner visage and spiritual body that signifies; it is not the adroit draughtsmanship or laboured technique, but the cry of spirit to spirit, mind stretching out toward mind, and Blake truly said of his contemporaries "They were blind and I have taught them to see." So important and far-reaching is his influence that an artist may now be known according to his attitude towards Blake. As Ruskin had pointed out, the name "Pre-Raphaelitism" is not only unnecessary but somewhat misleading, though having now become current Mr. Wilson was of opinion that it would have to continue. When Cornelius in 1844 was asked to undertake the decoration of the Houses of Parliament he recommended that the work should be given to William Dyce, and it was this work which had inspired young Madox Brown, who is so closely connected with the revival of the Arts and Crafts. Born in 1821, he had early showed remarkable powers, and a portrait of his father painted when young Brown was only fifteen years of age is perfectly astounding. After a training in Antwerp and Paris he became a perfect master of his craft, but though he had acquired great knowledge he had not found himself. Like Watts, he had the greatest contempt for handling and brush work, a fact which is chiefly exemplified in his cartoons. They are rubbed and scrubbed and it is not until you stand away from them that you see how the artist's self-denial has led you to the very heart of the subject. "Christ washing Peter's feet" (in the Tate Gallery), "Elijah and the Shunamite's son" (at South Kensington), "Ancilla Domini," "The Triumph of the Innocents," and "The Carpenter's Shop"—these, said Mr. Wilson, are the most perfectly impressive of the religious pictures of the present time. Perhaps the best work Madox Brown ever did are the frescoes in the town hall at Manchester. He was the precursor of the Brotherhood. The question now asked as to whose influence was the greatest on the movement—Holman Hunt's, Rossetti's, or Millais'—did not trouble these men, who worked with one heart, one spirit, and one mind, and if any could be said to hold the first place it would be Holman Hunt. The story of the lives of these men comes like an illuminated page in a dull book. Madox Brown was the Baptist of the movement and he prepared the way; Rossetti was the poet-painter gifted with great enthusiasm and passion and wonderful colour feeling; Hunt possessed the religious sense; Millais was the typical Englishman, but a perfect craftsman; and Burne-Jones was the dreamer whose dreams came true, and who had the great gifts of invention and of harmony combined with pertinacity; but all these men made one whole. After dealing with the modern critic, Mr. Wilson pointed out how Pre-Raphaelitism was the direct contrary of Impressionism. The aim of the Arts and Crafts Society was to produce first a school of artistic craftsmen, and second to imbue in the public an appreciation of the spirit of their works. It also desired to encourage the artist to be a craftsman, so that the resulting work might have the direct influence of the designer. According to Pre-Raphaelitism all beauty must be organic; beauty is the moment of transition; and the ideal, therefore, was the production of organic beauty. Pre-Raphaelitism had been much misunderstood, and we ought not to reproach it for not doing that which it had never intended to do; and it was out of this movement that the Arts and Crafts revival had sprung.

Bombay's First Block of Workmen's Dwellings is now being built.

PRESIDENT'S ADDRESS.

(Concluded from page 213, No. CCXLVIII.)

IT took one hundred years of learning and study, initiated by the Humanists (who saw that, apart from the theological training of Mother Church, culture and scholarship are inseparable from true human greatness), to usher in the Italian Renaissance; and then a further century of study of Greek and Roman methods, and of experiment and invention elapsed during the Quattro Cento (of which the Hybrid Classic and Gothic of the Certosa at Pavia and the Cathedral at Como are exemplifications) between the rise of Brunelleschi, the erection of his Pitti Palace, and the dome of the Duomo of Florence, and the time of Bramante, Michael Angelo, Raphael, Giulio Romano, Peruzzi, Sansovino, Palladio, with the production of such works as the dome of St. Peter's, the Chapel of the Medici, the Villa Madama, the Library of St. Mark's, and other works of the best period of the Renaissance. Is there any reason for thinking that this history of an advance in, or a Renaissance of architectural art is in any way being repeated in our time, or that with the unexampled wealth and prosperity of this country during the last hundred years, there has been a stirring of the dead bones of Architecture, and that we may even now be travelling towards the goal of a development of a fresh expression of English thought, and an evolution of a new modern style that some day may be no disgrace to our Empire? Possibly this might be answered in the affirmative, but what the evolution of our present methods may become remains to be seen. At the end of last century the Renaissance of the Cinque Cento, which a century or more later found expression in this country through Inigo Jones and Wren, had for years been in its decadence, and was at a very low ebb in England. The ascendency of classicism in our public schools and universities, where Greek and Latin were taught to the exclusion of modern languages and science, naturally had its influence on architects as well as on the general public, and resulted in a revived interest in Greek art and the study of Grecian architecture. This was encouraged and assisted by the researches and publications of Dawkins and Wood, and Stuart and Adams. But though in the first quarter of this century

The Antique was the Fashion,

mere reproduction was sufficient for work which was inevitably devoid of life. Greek and Roman façades or porticoes were attached to modern structures, ancient designs were reproduced irrespective of their suitability to modern requirements—sometimes effectively, but always incongruously. The British Museum, St. Pancras Church, and many of the churches with Doric and other classic porticoes, and town halls of this period, illustrate this. After the first twenty years or so, a more intelligent use was made of classic forms and details. It was then sought to give some expression to the specific purpose of each building, and some of our architects, following the methods of the Renaissance, began to use the borrowed details of Greece and Rome as a means to an end, and strove to adapt them more intimately to modern wants. The best works of Barry, Wyatt, Cockerell, and some others, prove this. Also the printed works of Stuart and Revett, Cockerell and Penrose, showed the real meaning of classic architecture. It is sufficient for my purpose to name some of the most prominent of our classic architects and their works. Amongst them were Decimus Burton, Soane, Nash, Wilkins, Basevi, Smirke, Wyatt, Barry, Cockerell, Elmes, Pennethorne, Cuthbert-Broderick, Gibson, of many of whose buildings we are proud. As examples of some of these works may be named University College; the Fitzwilliam Museum, Cambridge; Bridgwater House; the Queen's Mews at Buckingham Palace; the Taylorian Institute at Oxford; the Travellers', Carlton, Reform, and Athenæum Clubs; the Royal Exchange; Regent Street Quadrant the Royal Institution and High Schools at Edinburgh; the St. George's Hall, Liverpool; the Leeds Town Hall; the London University; Burlington Gardens; our much-maligned National Gallery, which the late Lord Leighton said "had often been made the butt of curiously unmerited ridicule, though it is much easier to deride than better it;" and also the Union Bank, Bishopsgate. Such buildings as these show that a distinct revival of classic architecture arose in this country during the second quarter of the century and how great an influence classic education had upon men's minds, there being no recognised national style in which all were constrained by public sentiment to work. In fact classic architecture appeared to be well set in public estimation with considerable chance of becoming the national style. Still, however greatly we may admire these works, they are wanting in the real life and interest found in the best buildings of any style, whether Greek, Roman, Gothic or Renaissance. In many respects they were unsuited to modern conditions and environment, and they bear no hint in their sculptured adornment of our country's history or life, and are thus devoid of one of

The Most Vital and Essential Elements

of good architecture. It has been suggested that ornament is not Architecture, but a very subordinate and non-essential part of it. On the other hand Ruskin has said that structures without beautiful adornment are mere buildings and not Architecture. The truth may lie between the two, but it is certain that the best architecture has always been intimately allied with sculpture, which invariably lent it its most vivid and living interest. Apart from the more important buildings of this earlier half of the century, much cannot be said in favour of the domestic and more common buildings of these years. Stucco was predominant, it hid a multitude of sins, and, compared with the better built and simpler style of the domestic and cottage architecture of the last and earlier centuries, there was nothing to boast of. In ecclesiastical work the Gothic style was used concurrently with the classic for secular purposes, but mainly of a late or Perpendicular period, producing a cast-iron effect rather than exemplifying the spirit of good mediæval examples. Then came a different phase in the architectural thought of the century, which was almost the death blow to the classic revival. There were many elements at work, which produced the awakening of interest in mediæval art, and which caused classic to be almost superseded by Gothic architecture, at any rate for a time. The discovery of steam as a motive power, for one thing, had caused a great influx of wealth and ease of travelling, resulting in a wider knowledge of the architecture of other countries and of past styles. No modern movement has been more influenced by literature than

The Gothic Revival.

Horace Walpole may have been a fribble, but he had a firm though uninstructed faith in Gothic. Beckford, the author of "Vathek," spent much money on what he conceived to be mediæval art, while Sir Walter Scott both built and wrote Gothic as he knew it. Then about 1835, Pugin published his "Contrasts," a vivacious and most sarcastic criticism on Pagan methods of Architecture compared with mediæval or "Christian." In 1841 his apology for the revival of Christian architecture was published, and other works followed, full of ardent enthusiasm for the resuscitation of severe mediævalism, particularly in reference to ecclesiastical structures. Ruskin's writings also greatly influenced not only architects, but their religious tone appealed to the public. At first, though, they were too strong meat for babes, as was shown in much Gothic work done shortly after. For example, owing to some remarks of his on the value of the outlines of the openings of traceried windows being more important than the details of the moulded stonework, the very coarsest plate tracery was erected, I suppose in exemplification of this truth, and for the economy in labour in refined mouldings. He powerfully pointed out the beauties of Gothic work, and urged the necessity for the living interest of good and meaning sculpture in noble architecture. The publication of other works on mediæval art and architecture by Rickman, Pugin and Le Keux, Scott, Parker, the Ecclesiological Society, Nesfield, Street, Shaw, Butterfield, Burges, and others, also Viollet-le-Duc's "Dictionnaire Raisonné," with its magnificent analysis of the scientific construction of Gothic work, put this style in an altogether new and entertaining light before the student. It increased the attraction of thoughtful men to the beauty, science, and detail of the Gothic styles. I can well remember whilst a pupil with Burges the intense excitement caused by the arrival of each fresh part of this work. Added to this the Oxford Movement and the societies it gave rise to for the resuscitation of disused ecclesiastical forms and ritual caused the study of ancient Church architecture and arrangement to be taken up by the rising clergy and others at the universities, who henceforth were careful to go to the most capable architects of the Gothic School. This movement also provoked greater enthusiasm amongst the architects themselves. Then ensued

The Battle of the Styles.

The ardent enthusiasm of the Gothic men for a revival of mediæval art and architecture, which blinded them to the beauties of classic, and the persistent denunciation of the severe classicists who could see no merits in Gothic, gave good grounds for the vigorous diversion of opinion which raged during the middle years of this century. Gradually, however, the Gothic school seemed to gain an ascendency, which lasted until the seventies. There were, however, architects practising in both classic and Gothic, according to the tastes of their clients. Wilkins practised in both styles and the best work the Italian Barry produced was perhaps our Gothic Houses of Parliament. At first the early thirteenth and fourteenth century English work was the admiration of these Gothic partisans; then Viollet-le-Duc's works brought early French into fashion, as being larger and grander in effect. Later on, entire satisfaction not being derived from these (they were, I suppose, too simple and pure for the complicated environment of our many-sided lives), Decorated and Jacobean each had their turn. Amongst the works of this Gothic awakening, those of Pugin, Scott and Moffatt, Pritchard, Paley, Butterfield, Street, Burges, Godwin, Pearson, and I may now add the name of Sir A. Blomfield, and some others still alive, are the most prominent, noted mainly in ecclesiastical buildings. I cannot here name examples of the works of all these men, and the best of them are known, I suppose, to most of us. It was in the forties that Pugin built his own house and church at Ramsgate, the only work, I believe, he said he ever really enjoyed doing, and this because he was unhampered by a client. A little later he rebuilt Alton Towers for the Earl of Shrewsbury, and St. John's Hospital, Alton. He also erected or restored some forty or more churches and cathedrals, and some twenty conventual and a number of domestic buildings. But the work which perhaps added most to his fame was the assistance he rendered in the working out of the intricate and refined details of Sir Charles Barry's sumptuous design for

The Houses of Parliament.

To my mind it is a fine combination, classical in its symmetry and horizontality, and Gothic in its picturesque outline and detail. In many respects it is the most notable building erected in England during this century, and to many it must be a matter of congratulation that our great Houses of Parliament should have been designed in a national English style of architecture, rather than in the more monumental classic. At any rate, whatever our views as to style may be, it stands as one of the most complete and best buildings of modern Europe. Of the men of this period, Sir Gilbert Scott stands out pre-eminent, not so much, perhaps, on account of any very particular individuality or extraordinary excellence in his works—though at the time they were extraordinary—as or the great part he played in the revival of this period, his enthusiastic zeal, and the establishment of what one might almost call a school of Gothic architecture, caused by the enormous number of works carried out by him in the erection and restoration of churches and cathedrals, and the training of a staff or school of young men sufficient for the purposes of his enormous practice. But for the overbearing attitude of Lord Palmerston we might have had from Sir Gilbert Scott in the Foreign and Colonial Offices a building which would have been as grand a success as the Houses of Parliament. However critically we may examine, at the present day, the works of these great men, we must always remember that the advantages of our time in easy travel, access to architectural libraries, and the multiplicity of illustrated works on all branches of Architecture now open to us, and the enormous increase during the last fifty years of archæological works, were not experienced by them. They were not smothered by learning as we are; they had to find out for themselves that which we can learn easily from others, and with more limited knowledge than the student of these days *ought* to possess, they worked energetically and earnestly for the resuscitation of our indigenous style of architecture. Further, however much the methods adopted for the

Preservation of Our National Monuments

may be cavilled at, and criticism is often captious, had it not been for the men of this period many of these buildings would have been, by this time, well on the road to irretrievable ruin. To them, therefore, members of this Institute, and men who gave much time and thought to its working, not only our gratitude, but that of the nation, is due. In some respects, perhaps, William Burges was the most original of the purist school of Gothic architects of this revival period, and the most deeply imbued with the mediæval spirit and the most familiar with its art and craftsmanship. He insisted that Architecture was not worthy of the name if it did not tell some tale, historic, poetic, or otherwise. He also urged a point which seems to have been lost sight of in these later years—namely, that all architects should learn to draw the human figure, and design their own sculpture—at least as to grouping and arrangement. His competitive design for the Law Courts, if not the best, was certainly the most monumental and notable of the Gothic ones submitted. His work at Cardiff for the Marquis of Bute, and in his own house in Kensington, in Cork Cathedral and Studley Royal and Ripon Churches, shows a genius for the invention of interesting and beautiful detail in the true mediæval spirit that no other architect of this age has approached.

Street's Works

are also so well known to you all that to mention more than one or two would be waste of time. He was one of those who saw that ecclesiastical architecture should meet the requirements of modern times—that large churches should be adapted for congregational purposes—and it is instructive to note his endeavours to connect a wide nave with a narrow choir—not always successfully, as at Bournemouth, where he canted the easternmost bays of the nave inwards, causing a pinched effect just where an open and spacious area seems to be demanded. His works, whether ecclesiastical, public, or private, were always interesting from the vigorous personality impressed upon them, and this was always apparent in his early works, as in the church at Garden Street, Westminster, in the later and much more refined one at Vassal Road, Kennington, in the house he erected for himself at Holmbury St. Mary, the mansion in Cadogan Square, and in the Law Courts, which was the last great effort of his life. These Law Courts unfortunately seem to have given the death blow to Gothic. It was not the fault of the architect so much as that of the building committee, which seems to have been determined to have a large central hall. Accordingly designs without this feature were discarded, notwithstanding that this waste of space, useless also as a foyer to the courts, deprived the building—to which an insufficient site had been appropriated—of the last chance of obtaining light and air to the corridors. The plan of this building may not be all that could be desired, but that is hardly the fault of the style of Architecture, though from this fact it has been argued that Gothic is unsuited to modern requirements.

Of the other notable figures in this revival of mediæval architecture I will only mention one. All were working for the same end, though often on slightly different lines and with varied success as to the quality of their work. In referring to the late Mr. Pearson I will only mention his last and, I suppose, his best and most beautiful work—Truro Cathedral—and that simply to point out what was certainly one of the failings in the methods of the Gothic revival. Truro is a modern cathedral intended to serve modern needs, but it appears to have been designed with a view to reproducing a mediæval church, whose plan was originated to meet requirements of other ages entirely different from those of to-day. There can be no doubt that for congregational purposes in these days, and for worship in which all can join, a central tower on piers blocking up the best part of the internal area is a sad mistake, and inexcusable unless a particular object of our church building is to erect in plan and detail mediæval structures that in future ages may deceive the enquiring archæologist. This was not the spirit of the men of the Italian Renaissance. But it is useless to attempt to specify the characteristics or buildings of each of the notable men of this Gothic revival period; their best works are known to us all. However adversely faddism or conceit may criticise many of them, it cannot but be felt that they greatly redound to the credit of the architects of this period, and also add the greatest interest to the history of the Architecture of the century.

Since the seventies, hot enthusiasm for a resuscitation of any definite style of Gothic seems to have smouldered and died, and to have been succeeded by

A Period of Flirtation

with pretty well all styles of Architecture. Byzantine, Moorish, Romanesque, Queen Anne, Dutch, French Renaissance, and even Egyptian have each had their admirers. The plain and severe, the rococo and ugly, the picturesque and grotesque have all been tried—all being the result of the study or copyism of debased deductions from those original styles which inspired the greater classic and Gothic architects of the second and third quarters of this century. The study of the purest examples of Art or Architecture must be the best tuition; if we endeavour to emulate the debased, our work will be on a still lower grade:

> "Noble souls
> Still find the base is hurtful, and the good
> Is full of glory."

I have heard of an architect saying he adored drawing a piece of impure detail, and another that he delighted in designing something that would give a shock, and I think their works prove the truth of their remarks. Such sentiments, however, can arise only from an ill-regulated fancy, or from a vulgar desire to attract attention, and cannot lead to great results. The overloading of detail and ornamentation is again another phase of a similar feeling. Many of the so-called adornments of modern buildings are not only not indispensable, but positively detrimental to the dignity of Architecture. Nevertheless, these latter years have been marked by a keen study and most enthusiastic interest in, and desire for, the good and beautiful in Architecture, with an earnest attention and effort to discover the right adaptation of known (and shall I add sometimes unknown) architectural forms to the manifold and complicated requirements of the time.

In looking back, then, generally at the architectural work of the century, what evidence is there of there having been, or being, any revival of Architecture in any way similar to those of past periods? Sir Gilbert Scott once said in these rooms, in reference to the earnest enthusiasm of the middle of the century for a resuscitation of our English Gothic architecture, that no parallel to it had occurred since the Italian Renaissance, and I believe he was right; and, further, I believe that we are at the present moment in course of an evolution in Art that may in time result in an uniform national style, and for the following reasons:—During this century there seem to have been three fairly distinctive periods; in the first the classic style was zealously cultivated; in the second the resuscitation of Gothic was passionately preached; in the third no one style has predominated, but there has been a restless searching and craving for something that shall satisfy the conditions and requirements of modern life. In the first period, though classic teaching led to the study of, and desire for, a revival of the antique, it was differentiated from the movement in Italy of the fifteenth century by so many of our architects

Subordinating Modern Requirements

to a clothing of ancient examples reproduced for the purpose, rather than designing in ancient methods with an individualistic treatment suitable to the occasion. This arrested true progress. It therefore failed in altogether impressing the nation with its suitability for English nineteenth - century architecture. Nevertheless, there was in the movement a zeal for stately and noble work, and it was this desire which caused the founding of the Royal Institute of British Architects as one means for the attainment of the end. The second period, with its thirst for knowledge and culture and facilities for education, certainly evinced a similar feeling to that which found expression in the Humanists of the fourteenth century in their insistence on scholarship and culture being necessary for the elevation of mankind. In their case it was apart from, rather than in conjunction with, theological teaching, while in this century, notwithstanding the broad views and freethinking tendencies of the age, it has been side by side with a distinctive religious awakening, which started and then kept alive the interest and desire for a revival of mediæval art, under the plea that it alone was Christian. This mid-century Gothic movement began with ecclesiastical architecture, and extended itself to civil work also. But it failed, as did the classic movement, in establishing itself as a recognised national method or style, and also for somewhat similar reasons

A Slavish Copyism

was engendered by reason of the scorn cast by the purists on detail inexact in its reproduction. To this school it seemed of more importance that every portion and detail of a modern Gothic building should have its precedent in the Middle Ages than that, as a building, it should exactly meet modern needs. This arrested individualism and thoughtful adaptation of the mediæval methods to our complicated modern wants. It was exactly (with some exceptions) the reverse of the principle which actuated the sculptor-architects of the Italian Renaissance. They adopted antique methods and details, and with original ingenuity pressed them into subserving their plans, not permitting them to dominate the requirements of the time. Nevertheless there was in this Gothic movement the evidence of life and a distinctive and ardent striving after architectural light, and a national general style; and this feeling was fostered and kept alive by men who were members of this Institute. England owes much to the men who led our classic and Gothic schools, and one cannot but feel that Fergusson's severe criticisms on their works are harsh and unjust. From his remarks it might be supposed that they used no brain power whatever, but simply copied, nor cared to do more than copy. He argues as if it were to be expected that a perfect style suitable to all our complex modern life could have been attained at one jump. We know that long periods, centuries even, are required for such an evolution. He seems to have thought that their first efforts should have reached the highest levels. A more reasonable view is that the copyism he denounces was but the first step in a legitimate process of development. Both by the classic and Gothic purists of this country that step was honestly taken. In this the third distinctive period of the century we see architects abandoning purism, and betaking themselves to an eclectic treatment of the two great branches of style. May we not hope that along this line a national architecture may eventually be reached, at once good in an artistic sense, and flexible and useful from a practical point of view? An analogous phase was gone through in the early Renaissance. Should this happen, I venture to think it will be found that the R.I.B.A. has contributed to it in no small degree. For the leaders of the movements I have indicated were members of our body, and we may justly congratulate ourselves on the steps we are taking to foster emulation of such excellent examples, for the careful and wide study of the rising generation of architects is fostered by it, and their keen interest is proved by the splendid results shown in the work produced under the incentives offered by this Institute in the presentation of medals, prizes, and travelling studentships for design, draughtsmanship, and for architectural research. Personally, I have a strong conviction that the evolution of a sound architectural style must be accompanied by a development of the neglected art of

Architectural Sculpture.

At all the best periods of architectural development, the sculptured adornments of the buildings (except where religion forbade, as amongst the Mahomedans) told their history. Have we, with our enormous Empire, nothing to record? Or is it owing to inability, indifference, or parsimony, that our life and history find no place in our architecture? Or does the crushing weight of the utilitarian element overwhelm artistic effort? Our Houses of Parliament have some forty or fifty statues of kings, &c.; the sculptured subjects suggested in Scott's Foreign Office design and Street's Law Courts were pruned away by the Government. Our huge railway stations and commercial and domestic buildings show nothing but meaningless ornament. Will our new public offices illustrate in any way the growth of Her Imperial Majesty's dominions? Or is the country too poor or indifferent to give our sculptors such a chance? Is it not impolitic of a Government in these discontented days to discourage the development of a craft the highest in Art, which elevates public spirit, gives employment to a large class of the most intelligent workers, and at the same time

Raises the Standard of Architecture,

and enhances the glory of a country. I learn that Frankfort has lately started a fund the income from which is to be spent in the adornment of the town with sculpture. This shows the increasing feeling there is in the cultivated world for such a step. Why cannot we do likewise? However, sculpture is a detail of refinement and adornment, and, if architects would suggest it properly and wisely, might possibly more often find place in our buildings. But aid, from sources external, to architects is needed in other ways if a national architecture is ever to be arrived at. London seems practically in process of rebuilding in its main centres, and constant enlargement is taking place in the suburbs. Surely steps should be taken to prevent our new streets being eyesores instead of improvements, and to avoid the repetition of such a medley of incongruities and commonplaces as may be found in Shaftesbury Avenue and Charing Cross Road. Architectural opportunities in these streets were afforded, which, under proper control, might have had a magnificent result. Surely there should be some controlling power to settle the general lines, heights, and materials of buildings and style of design. That the London County Council has something to say as to construction and heights is true, but their purely practical conditions being complied with, anyone can build according as his own sweet will, taste, or ignorance may prompt. This cannot be the right method in a great empire for the fostering of a national art like architecture. Every man who builds in a public street has a duty to the public to perform. His building should not endanger the safety of the public, but neither should it be a shock to their sensibilities. Proper control should render it impossible for us to see such a thing as I noticed the other day—a dull red brick Renaissance house on one side of a bright, glazed, teapot ware, pseudo-Gothic building, and a stone nondescript erection on the other, all of different heights, horizontality, and materials; while close by was another huge stone façade with heavy projecting columns and pediments, constructed surface ornament, standing apparently on nothing but sheets of plate-glass. Can anything be worse? Notwithstanding the modern shopman's requirements, architects should resolutely set their faces against such hideous uglinesses. In indifferent matters each man should have liberty of taste, if the indulgence thereof injures neither himself nor others. Individualism is needed in Art, but if the imagination or individuality be only a mark of undisciplined self and an offence to Art, it is positively injurious in its demoralisation of public taste, and should be restrained. Were there

A Ministry of Fine Arts,

with a committee of control under a chief whose qualifications were not *only* political, surely something might be done. The committee who were responsible for the Chicago Exhibition—a work which was magnificent in its effect, as all who saw it were agreed—was composed of architects and sculptors, who were charged with the erection and adornment of the numerous palaces. This committee settled the general style of buildings to be erected, the heights of cornices, floors, &c.; and each design was submitted to the criticism of the whole committee, who passed it, or suggested improvements, which the architect was forced to consider. The result was grand and stately, such as those who did not see it can hardly realise. I only mention this to show what can be done by intelligent control, and I do not think we are behind our American cousins in either intelligence or capacity for design. The Ministry of Fine Arts in Paris has such a controlling voice in all matters of public works, in laying out of the streets or boulevards, in the erection of public monuments, and even in their bridges, that in France it is entirely out of the power of anyone to erect unsightly edifices in prominent positions to the annoyance of the artistic sense of the nation. There is another thing that also affects our architectural design. We are always, in these days of greedy competition, in

Too Great a Hurry and Rush.

Art is long, and sufficient time for thought and quiet for solitary reflection is not afforded the busy architects of the day to properly solve the problems set before them. Designs for half a million's worth of building have to be prepared, submitted, and passed probably in, say, three months, and then the unfortunate architect is told that his designs are not equal to those of past ages. Ralph Waldo Emerson says: "We do not get enough of solitude, with the result that our minds are in danger of being vulgarised and of being unable to see things in their proper proportion." This is exactly what frequently happens to the architect of to-day; he does not get enough quiet for meditation. Let us hope that next century our architects, with their increasing wisdom which will enforce periods of rest for reflection and mental recuperation, and with higher cultivation which will improve taste, and under wiser auspices which, with an imperial spirit, will exercise an enlightened control, may develop a true style, sufficient for modern requirements and satisfying to æstheticism. As this goal cannot be reached by architects working on different methods and lines, and competing to outdo each other by differences or eccentricities of style, let us hope that we may, in a glorious enthusiasm for our art, be led to sink personal predilections in a combined effort to elucidate some style suited to the twentieth century, which, while allowing of individualism in the treatment of details, may have a general harmony and at last eventuate in a distinctive national architecture, stately dignified and picturesque; that may enhance the glory of this great empire, and be a proof that the British nation is neither sordid nor penurious, but that in its highest state of civilisation it may prove itself capable of emulating the best art history of past ages.

Mr. J. Macvicar Anderson said he had great pleasure in proposing a vote of thanks to the President for his address. He congratulated him on occupying the presidential chair. Knowing the duties and responsibilities of and also the pleasure of occupying that position, he was fully persuaded that he would discharge those duties in a manner not only creditable to the Institute, but to the profession of Architecture. He looked upon the address as a masterly review of the Architecture of the present century, full of research and breadth of thought and entirely free from any illiberality or sceptical opinion. The financial position of the Institute was a much more satisfactory one now than when he (Mr. Anderson) was in office. In 1896 there was a surplus of £591; in 1897, £1,116; and in 1898, £1,241. He hoped the Council would realise that because they had a surplus they need not spend it. He had always maintained that the Institute ought to have a more worthy home than they had. He urged them not to be in too great a hurry, but wait until they had, say, a surplus of £30,000. London was making enormous advances; the suburbs were being extended with amazing rapidity, but central London was becoming more and more congested. In the coming century the principal thoroughfares of central London must be widened and enlarged, and he asked would these opportunities be properly and worthily taken advantage of? He turned to the President's address for an answer, where it was stated that the study of the purest examples of Art or Architecture must be the best tuition. In this he heartily agreed, but later on the President said, in reference to this period: "We see architects abandoning purism and betaking themselves to an eclectic treatment of the two branches of style." In his humble opinion this was not so encouraging. Mr. Emerson had taken an optimistic view of the situation; he could only hope that results would justify that opinion. In reference to the President's remarks about some controlling power over London architecture, if this consisted in the appointment of a Cabinet Minister for political reasons it would not lead to any good whatever; if, on the other hand, a permanent Minister of Fine Arts were appointed solely because of his ability and knowledge of the arts, then good might result.

Mr. Joseph Smith, president of the Sheffield Society of Architects, in seconding the vote of thanks, said the Institute would do well to remember that 48 per cent. of its members were in the provinces. And they had only just tapped this source of membership, and he was sure that if the Institute would try to become of practical value to provincial architects, as it had become to metropolitan architects, it would acquire a much larger accession in membership. He did not agree with the President in his remarks as to definite and conscious efforts to realise a national style of architecture, but rather thought the contrary; they would best evolve a national style by honestly and seriously working out the problems which came to them day by day, meeting the requirements of those for whom they built, and clothing their efforts in the most artistic and pleasing forms.

Mr. F. C. Penrose wished to say, with regard to the new century, there was still one year to wait before the end of this present one.

The vote was then put to the meeting by Mr. Anderson and carried unanimously.

Mr. Emerson, in reply, said he had not worded the last sentences of his address so carefully as he would wish; he fully agreed with Mr. Smith that we ought not to strive to evolve a style; it must of course be a mere question of evolution and must come out of designing to meet the requirements of the age.

ARCHITECTURAL ASSOCIATION.

MARBLE.

A MEETING of this Association was held last Friday night, at No. 9, Conduit Street, Regent Street, W., Mr. G. H. Fellowes Prynne, the president, in the chair. The minutes having been read and confirmed, the following gentlemen were then elected members :—C. Thunder, H. B. Squire, W. A. Scott, W. H. E. Roberts, E. D. Dixon, T. J. Münka, J. A. Hossack, E. Gunn, M. J. Dawson, H. H. Dawson, H. P. Carter, C. T. E. C. Brooks, E. E. Bowden, and E. G. Allen. Messrs. A. H. Hart and H. A. Satchell were then re-elected members of the committee, having resigned in accordance with the rules of the Association as to officials. On the motion of Mr. Fellowes Prynne, votes of condolence were passed to the families of the late Sir Arthur W. Blomfield, and Sir T. N. Deane, of Ireland. The hon. secretary announced that as Mr. Gerald Moira would not be able to read his paper on December 15th, Mr. Andrew Oliver had kindly consented to read in its place a paper on "Old London," illustrated by lantern views. Mr. W. Brindley then read his paper on "Marble" as follows:—

In Architecture, the word marble conveys the idea of a stone of more importance than an ordinary building material. It is a stone, always possessed of some special beauty, either in texture, colour, or both, and of sufficient hardness to take a polish. The varieties are almost infinite, and, as numerous as they are, it is rare that any two quarries are precisely the same; there is

Always an Individuality

of some sort or other. We have marbles of one uniform colour, as white, black, grey, red, yellow, green, and so on; but in all cases, even in whites and blacks, there are differences. The whites of Carrara, Italy, vary with those of Greece, Spain, and America. The blacks of Belgium are not the same as those of England and Ireland. The serpentines of the Lizard, Cornwall, vary with those of Banff, in Scotland, and Anglesea, and further vary with those of the Continent and America. These variations are not to be wondered at, when for a moment we study their origin, and the different changes they have gone through as part of the earth's crust. Their ages are equally wide, some being, comparatively speaking, recent, while others are old, and some very old. The white crystalline marbles are now conclusively proved to be nothing more than ordinary sedimentary limestone rocks, like our chalk cliffs, or carboniferous rocks, which have gone through a process of cooking or baking under great pressure, while being hermetically sealed by overlaying rocks, which have kept in the gases, causing the limestone rock to crystallise and alter its nature to such an extent that rarely any of the fossils are now discernible; in short, a new rock is produced. There are other whites that have been produced by hot springs carrying, in solution, a large quantity of lime and silica, which deposits directly the carbonic acid gas is liberated in the atmosphere, often producing a rock of the purest whiteness, or coloured by any metal that the hot water may pass through.

Black Marble

is a sedimentary limestone coloured by carbon, which colour is immediately destroyed by heat, producing the whitest of lime oxide. We get black marbles with white veins; these white veins are usually younger than the rock itself, being infillings of the cracks produced by different causes in the history of the rock. These remarks about black rocks apply equally to red and yellow ones. Another class of marble, the Breccias, have gone through all sorts of nature's changes and disturbances; they are rocks that have been broken into irregular fragments, and been cemented together again by nature, and after that in some cases have gone through a baking process and the like. Nearly all our green marbles are earlier rocks that have been altered, and in some instances been broken up and re-cemented, like Verde Antico. The greens are nearly all magnesia while the whites in the same mass are lime; occasionally we get both white and green magnesia in the same mass. This slight geological introduction will prove to you that, as marbles are produced under such varying conditions, the quality must be equally various, both in hardness and durability. Again, some marbles, like the Purbeck, are not much more than very greatly compressed mud and fossils, whereas others are only baked compressed clays. When used in damp situations, these often go back to their original elements, and it further happens that a marble that behaves fairly well in Italy frequently will not stand at all with us. And there are marbles that, like building stones, have to be placed on their natural bed. Most marbles will stand in isolated shafts, or engaged pilasters, but experience shows us that only a very limited number used as

Slabs for Wall Linings

can resist the moisture of a newly built wall. The destructive power of this moisture, be it hydraulic or chemical, is such that it very shortly destroys the face of many marbles; all those of a slatey or sedimentary nature, face-bedded, go directly—for instance, the Swiss Cipollino—but if cut across the bed stands fairly well. Then again, certain marbles, like Purbeck, Emperor's Red, and Verona, which consist chiefly of flatish fossil shells, when face-bedded on damp walls become pitted with small holes, while across the bed they stand all right; nearly all this class of fossil marble is only obtainable in thin beds, so a large slab has to be face-bedded. These same remarks apply to certain red marbles found near Carrara, which are red clays compressed and baked by the same heat that has produced the crystalline whites. When the Greeks used marble in Architecture it was always treated as an ordinary building stone; no attempt was made to save material, everything being massive, and the blocks were ground or rubbed together until the whole structure was next to homogenous, without the aid of mortar or cement. Their columns, as you are aware, were built with thick drums; these blocks were worked roughly in the quarries, with projecting bosses on the sides, to which, most probably, were attached some wooden arms to enable the blocks to be revolved forwards and backwards on the wooden centres until the two faces came together with an almost invisible joint. When built the whole column mass was skilfully masoned into a pillar with all the Greek subtlety of diminishing entasis, and delicate flutings. The durability of this work, had it not have been for earthquakes, and the ravages of man, would have been perfect now. Those who have not seen

The Acropolis of Athens

can scarcely realise the beauty of this immense marble pile, whose sublimity of colour is in harmony with the subtlety of form. It is not the cold blue-white marble of Italy, so common with us, but a translucent warm ivory tint, becoming often ochre yellow; this deep colour which is only surface, is usually attributed to great age, but this is not correct, as is proved by the colouring of recent fractures on the Parthenon, and by modern buildings in Athens, a good example of which is a high slab plinth round the Royal Palace. This marble is already nearly as yellow as the Parthenon. The marble contains minute crystals of iron pyrites, the decomposition of which yellow ochre colours the marble. In the Greek temples of Delphi, Sicily, and Pompeii, the common worked stone was plastered over with a marble-like stucco, which is thought to be marble dust with lime and albumen. I think now from what I saw recently in Greece, that it may be white crystalline marble not quite burnt through into lime; this I saw being finely crushed with rollers by horse power for plaster work.

Early Quarrying.

There is no doubt the Greek methods of quarrying became the Roman, but it is impossible to imagine that the Greek could have quarried better than what we now find remaining of Roman work, and this not only in the white quarries of Pentelicus, but in the various coloured quarries found in many of the Greek islands. These old Roman workings you can always tell at a glance by the carefully tooled upright face of the rock. I saw lately in an old quarry on the island of Scyros an axed face some 60ft. high. Although the Romans took over all the Greek white quarries, they were not content with this, but opened quarries of choice colour wherever they could be found, and these they worked for monoliths to embellish their buildings in Rome and colonial cities. The Roman method of quarrying monoliths for shafts and architraves was by working them *in situ* engaged to the parent rock, either horizontal or vertical, according to the bedding and the solidity of the rock. In the Verde Antico quarries the upright large semicircular hollows remain showing where the great Justinian columns for St. Sophia, Constantinople, were got. Sarcophagi were quarried by being worked all round engaged to the rock at the bottom, being afterwards wedged off. In the old Carystian quarries of Cipollino, there are many examples of both finished and unfinished bed work *in situ*. In one quarry, some two thousand feet up the very steep mountain side of "Ocha," on a shelving mass of rock overhanging an awful precipice, are eight columns, 39ft. long, beautifully wrought, with entasis and top and bottom members quite finished and ready to be fixed, probably in the portico of the temple like that of Antonius and Faustine in the Forum of Rome; one of them is only a few feet off the sloping edge of the precipice. How they contemplated getting them away is and must, I fear, ever remain a mystery. In addition to these finished columns, there are several of similar size, partially wrought, engaged to the horizontal face of the rock; other immense masses were stept and partially worked for various purposes.

White Marble.

Roughly speaking, perhaps, three-fourths of the white marble used in the world at the present day comes from the Carrara district of Italy. The marble mountains extend some twelve miles; they consist of mountain peaks going up to an altitude of 6,000ft. The sides of these mountains are scored with valleys and ravines which have only three outlets—Carrara, Massa and Seravezza. On the sides of these valleys are the different quarries, of which there are some 600, "producing annually about 200,000 tons." The water coming from these ravines turns innumerable sawing mills, which slab annually some 60,000 tons of marble. The towns are full of workshops and studios. The marble businesses support in the district some 10,000 people. Any young student who likes mountain scenery, with picturesque sketching and architecture, cannot find a hunting-ground anywhere to surpass this. He will find beautiful Byzantine, Mediæval and Renaissance work in marble that cannot be surpassed, or rarely equalled in Italy. It was the land of the Medici, the playground of Michelangelo and Donatello. I believe a young man could spend a month, pay his fare from London and back, hotel accommodation, including food and Chiante wine *ad libitum*, for less than it would cost at an English seaside town. He would also pick up a little Italian. Nearly all the best statuary of the world is quarried at Mont Altissimo, Seravezza, near Carrara, this is the famous H-marked statuary of commerce, H being for Henraux, the proprietor. In Italy there are also old white quarries near the coast not far from Grosetta, between Pisa and Rome. The Cathedral of Milan was built from quarries above Baveno. Spain has several extensive deposits of white marble. The best is the one the Moors used at the Alhambra, the quarries of which I visited some years ago; they are at Macael, between Lorca and Baza. There is good quality white marble in Trazos Montes, Portugal, where an enterprising company ten years ago quarried £20,000 worth without any prospect of getting the blocks away, and there they are now. France has white marbles at St. Beats, but there is little demand for them, although there is a considerable duty on foreign produce in France. Norway has extensive deposits, but very little of it is good. Some was used for ashlar at the Junior Constitutional Club, and it seems to be standing very well. The finest quality is at Velfjord, where it is only about 100ft. off very deep water for shipping. There is, further north, a crystalline white marble, which is a dolomite. The late war of the Greeks and Turks would seem to have enriched the Athenians, for they are pulling down their old buildings and erecting lofty Pentelic marble ones in their places. They are full of architectural detail, which is very well done. The marble is chiefly obtained from the south or Athens side of the mountain, near the ancient workings. A company is now working the north or Marathon side. I have examined the different quarries very carefully, and am of opinion that they are the same beds as the south side, but the famous old cave statuary is not yet found. They are extracting large blocks, some of which are being used in the safety repairs of the Parthenon. My firm, Messrs. Farmer and Brindley, are working blocks of this marble which those interested can see. It is considerably harder and more costly to work than Carrara.

Quarrying.

In marble quarrying considerable skill and judgment is required; the mass of rock is rarely solid enough to be stepped down as in ordinary stone quarries, and blasting cannot be employed, except for clearing away masses of inferior material. The colouring and marking of such marbles as Pavonazzetto does not extend through the face of the rock, but is a veined mass or bed in the statuary formation, the same quarry producing first and second quality statuary and first and second Pavonazzetto. The system is, when a choice solid mass is found, to work away from the top and sides all inferior rock round the good mass; it is then sawn or wedged into blocks as large as can be obtained free of shakes. A few months ago I saw in the quarry of Crestola a solid mass so cleared of about 100 tons, worth over £1,000 sterling. The removal of the blocks when quarried is done in a very skilful manner by a specially trained group of workmen, and it is surprising with what ease and rapidity they will remove blocks, often 25 tons in weight, from the quarries and down a steep declivity to the loading place, where they are taken away on a specially built truck drawn by sometimes as many as thirty-six oxen. There are no lifting cranes in the quarries—only crowbar levers are used. The men get round the block, each with his lever, and they all lift at the same instant, the signal being given by a lively sing-song. The blocks are lowered down the mountain-side by means of ropes passed round posts. The block, being on a sort of sleigh, is slid over hardwood sleepers greased with a bar of soap. A man rides on the block, and passes the sleepers given him from behind to front. The old Rhondona and Breche Violetts are usually underground quarryings, and extracted by the aid of long saws, a channel being cut first over the block to free it from the roof, and a chamber at each end for the men to saw in. By this means they sometimes get a block of sufficient size to produce two monolith columns 14ft. long. The red Levanto Breccia and Genoa green is also sawn out of the rock. The re-found Verde Antico of Thessaly is a hard Breccia of greens, greys, and whites. The quarrying of this is by the aid of the wire saw, which is a three-strand endless steel cord of over 2,000ft. in length running over descending pulleys, and being fed with sand and water: this cuts the marble. This method of extraction is the latest and most improved, as it in no way injures the marble. It was from the quarries of Synada, in Asia Minor, that the Romans got their beautiful red purple veined Pavonazzetto, and all other sorts of this marble; these quarries also produced beautiful pure white statuary, and a rare variety of delicate flesh tint. The antique marbles, Numidian Yellow, Laconian Red, Thessalian Green, Africano Breccia, Carystian Cippollino, Egyptian Porphyry, Laconian Serpentino, Breche Universal. These are unique and have no modern representatives. Unquestionably the best yellow marble known is the Giallo Antico of the Romans. The columns of the Arch of Constantine, which were Trajans, and half those of the Parthenon, are of this marble. It varies from deep ochre yellow, to pale and a delicate rose colour; its markings are red and blue purples, the grain is crystalline, and it is translucent. This is the marble found in the encrustation of the palaces of the Cæsars, the baths of Carracalla—in short, it was the only yellow used in old Rome. The quarries, which are very extensive, are in Tunis, near the frontier of Algeria; they were extensively worked about fifteen years ago by a Belgian company, which failed owing to having an engineer as chief of the quarries instead of a practical quarryman. The next in quality is the yellow of Siena, which is familiar to all. The best quality of this yellow is now not obtainable. Beautiful panels are often seen in old Adam's chimney-pieces. The South of France, Spain, and North Italy produce about a dozen yellow varieties, but they are all inferior in quality to the two first named. The coloured marble most used by the Romans was the Carystian (Cippolino) from the island of Eubœa; there was more of this used in Rome than all the other colours added together. The first reason may have been owing to the immense size monoliths could be got as supports for their porticos and basilicas, but great quantities were also used for decoration, as it opens out well into chevron pattern more beautifully than any other marble. There are dozens of old quarries on the Island that have been examined by French, Germans, and Italians, during the last twenty years for the purpose of reworking, but in all cases it was found that the Romans had taken all the good stuff away. About four years ago a mountain that slopes down to the sea, and away from any mule track, was found on its sea face to have a large number of old quarries. These contain an almost inexhaustible quantity of first class marble, which can be got in large sizes. These quarries I am now working, and those interested can see monoliths made of it, some 14ft. long, for the new Roman Catholic cathedral at Westminster, and you will also see it at the Royal Academy in the vestibule improvements. Some twenty years ago a Swiss Cipollina was found, with colourings very similar to the old, but with very different markings, as it does not produce, when opened out, grand patterns, and, although it stands well in detached monoliths, experience proves it will not stand on new walls or floors.

Onyx Marbles.

Some thirty years ago a very extensive deposit of arragonite was found near Tlemcen in Algeria; the old quarries were here from which the Moors obtained this beautiful marble so plentifully used in their mosques at Tlemcen. The purchaser of these quarries was Signor Del Monti, an Italian resident at Oran, and he it was who for commercial purposes named the material onyx, from its translucency, like the finger nail. The misnomer "took on," and is now generally applied to all this class of very translucent marbles, some of the most beautiful of which have of late years been found in Mexico and in South America. Just recently it has been found in the Caucasus. The name onyx appears very appropriate, but it would be better to call it lime onyx, so as not to confound it with onyx proper, which is silicious. The formation of this material is most likely a deposit from hot springs, such as now goes on at several well-known springs in different parts of the world. The rock Oriental alabaster was used extensively by the Egyptians, of which the most exquisite example is the famous sarcophagus in the Sir John Soane Museum. The Egyptian quarries are in the eastern desert, and they were reopened and extensively worked by Mahomed Ali for his great mosque at Cairo. The beautiful monolith columns, which support the baldachino over the high altar at St. Paul's, outside the walls of Rome, were presented by Mahomed Ali. This Arragonite marble is produced chiefly by the lime water droppings from the roofs of caves forming stalactite and stalagmite. A short time ago, I visited some very interesting deposits in Traz os Montes, Portugal; one very large cave had a floor thickness of some six feet, with hundreds of stalactites actually extended until they were engaged to the floor mass, forming a labyrinth of natural columns, and other caves had become completely filled up, so that blocks of very large size could be extracted quite sound. Last year also was discovered at Amiato the quarries that supplied Rome, Siena, and Naples with the brown, yellow, and honey varieties. The colouring of these marbles is usually iron in solution. As beautiful as the Mexican varieties of onyx are, they are rarely successful when used in Architecture, for wall surfaces, or mouldings. For articles of virtu as room embellishments with ormulu, as used by the French, they are a decided success. With the yellow and brown variety, which is less translucent, as seen in the Paris Opera House, there is not the same difficulty in using.

Serpentines.

The serpentine marbles of which we have extensive and massive rocks at the Lizards, in Cornwall, and Banff, in Scotland, although beautiful, have never proved of much architectural value, chiefly owing to the thin veins of steatite containing iron pyrites, which expand when exposed, and cause the work to split up. It was used considerably thirty years ago in Gothic work, and several good fonts were made. There is no doubt the broader and simpler the material can be treated, the better. The French would seem to have been more successful than we have with this our own material, as there is in Paris an important front near the Place de l'Opera which is certainly very good and is standing well. The massive architraves to the doorways of the old museum in Berlin, by "Schinkel," are made in a grey-green serpentine very dark in colour. These large doorways are grand and impressive. France is very rich in coloured marbles, the most important being those of Sarrancolin, the reds of Cannes, near Carcassoune, and the yellows of the Jura and Du Var. The quarry of Bianco, Nero Antico, provided large quantities for the use of the Romans, as did the mottled reds and greens of Campan, and the green of Maurin. It would be wearisome to enumerate those of France; there is a complete series of 700 cubes in the National School of Public Works in Paris. Algeria is famous for rich reds. Those of Oran and Chennoua are the best; the latter were used in our National Gallery. Spain has also grand marbles; a good collection of these, which number about 250, will be found in the Mineralogical Museum of Madrid. Portugal has famous quarries of rose colour, near Cintra.

British Marbles.

You are all familiar with our beautiful Devonshire red and grey marbles, of which there are a considerable variety, many of which are sound and good, and far superior to the Belgian reds, but owing to heavy railway rates cannot compete at all in price. The same remarks apply to the Derbyshire and Staffordshire ones, which have almost gone out of use. This is sad, when we consider the first marble mills in this country were those of Ashford, near Bakewell. Ireland has good marbles, too; the Connemara green is unique, and the black is excellent, but still the carriage and bad quarrying prevent their use. The fact is that more beautiful foreign marbles, owing to water carriage, can be got into London for as little or less cost than our own. It is pleasing to know that England has always held her own in marble work. I do not think anything can be found better done or more difficult than our old Purbeck, Early English, and Early Decorated work. You will call to mind Westminster Abbey (with its Chapter House and tombs), the Temple Church, Salisbury and Lichfield, and Royal tomb of Edward II. at Gloucester, the shrine of St. Alban, the Grey monument of York, and the elaborate Bishop's tomb, at Rochester.

(*To be continued.*)

Theatre for Hampstead.—The Theatres Committee of the London County Council have passed the plans for a theatre to be erected at South End Green, Hampstead.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*Great edifices, like great mountains, are the work of ages. It is frequently the case that art changes while they are still in progress. The new art takes the structure as it finds it, incrusts itself upon it, assimilates itself to it, proceeds with it according to its own fancy, and completes it if it can. The thing is accomplished without disturbance, without effort, without reaction, agreeably to a natural and quiet law. Certes, there is matter for very thick books, and often for the universal history of mankind, in those successive inoculations of various styles at various heights upon the same structure. The man, the artist, the individual, are lost in these vast masses without any author's name; while human skill is condensed and concentrated in them. Time is the architect, the nation is the mason.*"—VICTOR HUGO.

London's New Theatre. ON one of our inset pages this week we give a perspective of Mr. Charles Wyndham's new theatre in Charing Cross Road, to witness the opening of which on Thursday next with "David Garrick" such high prices for seats have been paid. The entire proceeds of the first night will be devoted to the Soldiers' Wives and Families branch of the Mansion House Fund. The new theatre has a frontage of 84ft. and the distance from the pavement to the parapet of the centre block is 51ft. The front need not be described as the illustration will supply all the necessary details; it may, however, be mentioned that the exterior is of plain stone. The entrances on the right hand side are for the reserved parts of the building, on the left there is a special door for royalty and persons of distinction, while in the middle are the exits for the unreserved parts. Though the interior is small, it is cosy and neat, and has been tastefully decorated, a great deal of fibrous plaster being used, as in other theatres. The marble staircases will doubtless look very handsome when everything has been cleaned, though at the time of the visit of our representative the workmen were busy adding the finishing touches, and their rubbish still remained. The dress circle will hold 150 persons and the width of the auditorium is about 54ft. The inside decorations are in the Louis XVI. style and the tints used are delicate and blend well together; around the walls on the ground floor there is a dado formed with marble slabs, above which is a light blue paper with a straight white pattern on it. Of boxes there are a dozen, and though these are very elaborate, the attention bestowed on them has not prevented the gallery and pit being well looked after, for the seats here are spacious and there are no columns to obstruct the view of the stage. The proscenium is 26ft. across, and is surmounted by a moulding containing figures holding medallion portraits of Goldsmith and Sheridan. There is sufficient height to allow the scenery to be lifted without rolling. The roof garden, of which so much has been heard, will not be ready till next summer. It is 54ft. wide by 44ft. long, and will be reached by a lift from the entrance to the stalls. We think that Mr. W. G. R. Sprague has succeeded better with the inside than with the outside of this theatre.

No. 17, Fleet Street. THIS house which is on the south side of Fleet Street, and adjoins Child's Bank, has come into prominence of late, because it is about to be pulled down and rebuilt. There is an inscription on the front which falsely proclaims it to have been the palace of Henry the Eighth and Cardinal Wolsey; in reality it was once the Chancery of the Duchy of Cornwall, and appears to have been built between the years 1610-12. In all probability it is the work of Inigo Jones, who, on the creation of Henry, the eldest son of James the First, as Prince of Wales in 1610, was appointed surveyor of the Works of the Prince's household, and would presumably carry out any work required for the Prince as Duke of Cornwall. It is known that the Duchy of Cornwall had offices in Fleet Street, and on one of the coffers of the ceiling of the first floor can be seen the Prince of Wales's Plume, with the initial of Prince Henry; this clearly identifies the room on the first floor as the council chamber. The plume also appears on the panels on the front of the house. The gateway to the Inner Temple which passes under the house appears to have been built at the same time and to have formed part of the house, a characteristic ornament on the front of the house being repeated on the pilasters of the gateway.

Glass Tests. PUBLICATION No. 30 of the British Fire Prevention Committee gives some interesting particulars of tests made with fire skylights glazed by the British Luxfer Prism Syndicate, Ltd., of London. The prisms were 4in. square, framed with a copper border, and fixed to T-iron skylight bars 1¼in. square, with teak cover fillets on top; each skylight showed glazing measuring 1ft. 8in. by 3ft. After being under test for twenty-two minutes the prisms began to crack and the cover fillets caught fire. Water under pressure was then turned on for two minutes and the fire skylights were bulged up about 2in. in the centre, but the prisms remained in position, though cracked by the heat and water. By about fifty minutes after the fire was started, all the skylights except one had fallen in and the fillets were well alight. Tests made with three casements glazed with wired glass by Messrs. Pilkington Bros., Ltd., of St. Helens and London, are described in No. 31 of the Committee's publications. Each casement showed 2ft. 9⅞in. by 3ft. 11½in. of glazing in the clear. After one minute the glass commenced to crack in various directions, but no smoke or flame came through; in twenty-eight minutes the teak frames were alight on the outside; in thirty minutes the glass in the centre casement began to buckle and let the flames through, and shortly afterwards began to fuse and bend downwards; and after the test had lasted forty-nine minutes the glass in all the casements was doubled in various shapes, though not broken. The photographs which illustrate the committee's reports are extremely interesting and well printed.

The Crystal Palace Roof. CONSIDERING that the Crystal Palace was originally intended to be only a temporary structure, it has weathered very well, and it is, therefore, not surprising to learn that part of the roof, which is probably the largest of its kind in the world, required renewal. The work on the centre transept is now being completed, and has proved no light task for Messrs. Mellows and Co., of Sheffield, because it is carried on at a height of 161ft., and covers something like two acres. It involves the use of 100 tons of glass! The total glass area of the Crystal Palace roof is between fourteen and fifteen acres. In the interval since Sir Joseph Paxton first put up the building in Hyde Park, in 1851, the world has made great advances, but it is chiefly in regard to materials that the great designer is shown to have been lacking. For instance, he introduced into his plans the ridge and furrow system of glass-roofing, the result of which is that hailstones rarely strike the Crystal Palace except at a harmless angle. This system, which has enabled the building to weather many a severe storm, has not been improved upon. But, in the matter of glass, Sir Joseph Paxton was at a disadvantage. Forty-nine inches was the extreme length which the manufacturers of half a century ago could produce, and by that factor, it is stated, the relative dimensions of the Palace were mainly determined. To-day there is practically no limit in the matter of size or weight of glass, while the art of glazing without the aid of putty has long since come to stay. The result of these present-day facilities is that a very light yet substantial roof will shortly span the whole of the transept, and, while the workmanship is modern, in the best sense of the word, the harmony of the general design is in no way interfered with. Some £12,000 have been spent on the work, and eventually this sum will be considerably increased. The two naves are to have a new roof. Sir Douglas Fox and Mr. V. B. D. Cowper are the consulting engineers.

The British Association. IT has been suggested from time to time to that great body the British Association, that they should occasionally take a bigger sweep and go outside the United Kingdom to hold their annual meetings. As a result the scientists have met twice in Canada, and now it is stated that the council have received an invitation to hold their meeting at an early date in Ceylon. It is, however, very improbable that the council will see its way to accepting the invitation. The time required for the double journey would be an obstacle to the attendance of many members, so that nothing like a full meeting could be expected, while the period of year at which the association usually assembles is also a serious consideration in connection with a proposal for its going to a tropical climate. While, however, there is no immediate prospect of the British Association leaving the United Kingdom, it is very probable that a visit to Ireland may be arranged for the year 1902.

Pre-Historic Egypt. IT was stated last Friday evening at the general meeting of the Egypt Exploration Fund, that the work of the season now beginning would include the protection of some portions of the great temple at Deir-el-Bahari, and it was hoped that the task would now be completed. Professor Flinders Petrie had been expected to speak, but he was kept away by illness. He sent, however, a paper describing the work of exploration at the great cemetery of Semaineh, near Abadiyeh, and afterwards at Hu, the ancient Diospolis. From the order of the graves as found by the pottery, he had obtained the history and the development of stone vases, ivories, and the working of flint and metal—for even the earliest of the tombs contained copper. One of the most curious differences found in connection with the pre-historic age being studied was, that the older people largely used signs which were the forerunners of the Mediterranean alphabets, while the later people ignored such signs. The characteristic pottery of the earlier people was closely like the Kabyle pottery at present; the later people had some pottery almost identical with that of South Palestine in historic times. All these indications pointed to the earlier being a Libyan population, overlaid later on by an Eastern migration. These results had only been reached in the last few week.

Royal College of Music. THE foundations of the new concert hall at the Royal College of Music at South Kensington (an interior perspective of which is given on one of our inset sheets) are already completed, and the superstructure is now in course of erection by Messrs. Bywaters and Sons. The examination rooms are under the hall, while at the rear are the boiler house, store rooms, &c. At the side and at the platform end are the dressing-rooms. The concert hall will have seating accommodation for 1,200 persons, and the orchestra is specially arranged for rehearsals by the students. At the rear of the orchestra a large organ will be provided. The building outside will be faced with red brick, having buttresses to relieve the walls of the weight of the roof, the span being 58ft., and the hall 120ft. long. The inside will be treated with decorative plaster, and the ceiling done entirely in fibrous plaster, with pierced panels for extract ventilation, the roof inside having a ventilating trunk with ventilators at intervals. Mr. Sidney R. J. Smith, F.R.I.B.A., of 14, York Buildings, Adelphi, W.C., is the architect. His design was placed first in the limited competition for which Mr. Belcher was the assessor.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

R.I.B.A. INTERMEDIATE.

In reply to "F. O.," Halifax. (1) A design for a boathouse is published in The Builders' Journal for December 30th, 1896. (2) A list of books suitable for preparing for the R.I.B.A. exams. can be obtained from the Secretary, 9, Conduit Street, Regent Street, W.

BUILDING RIGHTS.

W. G. (Wilts) writes:—"A has a building with the eaves gutter overlapping B's property. B wants to build up against A's wall, and carry his wall somewhat above A's eaves. Can A prevent him doing this?"

If A's gutter has been in existence for nineteen years and a day, it may not be interfered with, an easement having been acquired. If it has only existed for a shorter period, it may be dealt with as suggested. In either case, a friendly arrangement had best be come to, and reduced to writing with the aid of a solicitor, so as to avoid the acquirement of further easements, such as right of support, by either party after the lapse of another nineteen years and a day.

G. A. T. M.

CHARGES FOR WALL PAPERING.

Yawless (Clapham, S.W.) writes:—"Will you kindly inform me if the term "paper walls" in a specification would include French wall papers. I have been told it does not. Also, can I charge the extra pieces of paper required, owing to it being a different measurement?"

It would depend entirely upon the exact wording of the specification; but taking a common-sense view of the matter it seems as if French papers, if selected, would have to be supplied up to the value per piece mentioned in the specification, but that an extra charge might be made for the additional number of pieces required. As English papers are almost invariably used, the estimate was naturally based upon the usual English sizes.

G. A. T. M.

POWERS OF LOCAL AUTHORITIES.

E. J. E. writes:—"Can an Urban District Council prevent the erection of a stable or other building which is intended to be built with galvanised iron, and which would be an annoyance to the people residing near, on account of its unsightly appearance? Does a stable come under the same laws as a dwelling-house?"

An Urban District Council can prevent the erection of a building not in comformity with their by-laws; and a stable would usually come under the same regulations as a dwelling-house as regards the construction of its walls, &c. But it does not appear that any authority can prevent the erection of a building merely on the score of its unsightly appearance.

G. H. B.

LINE OF STUDY FOR A BUILDING SURVEYOR.

Enquirer (Lye) writes:—"What line of studies must be undertaken for the profession of a building surveyor? Are the terms building surveyor and architect synonymous?"

In London the callings of architect and of building (or quantity) surveyor are usually distinct, but many country practitioners, and some in London, also combine the two. Anybody intending to become a building surveyor would do best to be articled to someone practising in this way, preferably in London, but having regard to the fact that there are several systems of quantity surveying of local application only; or he might pass through the three years course of instruction in the architectural school at King's College, London.

A knowledge of planning and of architectural practice, as well as some skill in draughtsmanship, are essential.

G. A. T. M.

CLEANING BACKS OF DRAWINGS.

G. A. B. (Wolverhampton) writes:—"I have recently been finishing some drawings for the R.I.B.A. intermediate examination, and when I removed them from the board (they having been previously stretched) the backs were covered with a woody substance which I could not remove. As I consider that this would tell against the drawings in the examination, I should be very much obliged if you could tell me how to remove it. How would it do to mount them on a second sheet, and how would this be done?"

The "woody" substance referred to is doubtless some of the surface of the drawing-board which has remained on the drawing after it was taken up. This, however, should certainly not have adhered to the paper, and it is in all probability owing to the fact that the sticking paste has been put over the whole area of the paper, whereas it should only have been applied to the turned up margins. The best way to remove the substance will be either to slightly damp the paper and gently scrape with a sharp knife, or to get some fine sand paper and rub upon the surface until it is removed, care being taken not to penetrate the paper in any way. When it has all come off, it is probable dirty marks will remain; another piece upon the back of the first should now be stuck on. This can be done by damping the back of the first with a sponge, care being taken not to get it too wet. Also wet one side of the piece to be applied, then with a large paste brush thoroughly rub over the dry side of the second piece with starch dissolved in water. Take it up by two of its corners and lay it on the first. Smooth these over with a handkerchief, see that no air remains between, put them under a press or a heavy weight, and leave for twenty-four hours. No fear need be felt that the marks on the back of the paper will disqualify his drawings.

H. F. W.

BUILDING FRONTAGES.

Alpha (South Tottenham, N.) writes:—"I am desirous of building one shop fronting an old road abutting on my estate (which has no restrictive covenants). The nearest house is 100ft. from the proposed building, and is set back 15ft. from the road. Can I build up to the front line, or must I set back? The site is situated in an urban district, and the width of the road opposite the proposed shop is 40ft. I am informed that the Bristol decision would enable me to build out to the front. Can you give me the date of this case and your opinion?"

Section 3 of the Public Health (Buildings in Streets) Act, 1888, prohibits the erection, in any urban district, without the written consent of the urban authority, of any building in any street beyond the "front main wall" of the building "on either side thereof in the same street." The house mentioned by "Alpha" as being 100ft. away from his proposed building appears to be "in the same street" for the purposes of Section 3, but whether it is near enough to be "on either side" for purposes of the same section is a difficult question to decide. The "Bristol decision" to which "Alpha" refers, is probably in the case of *Attorney General* v. *Edwards*, tried in December, 1890, and fully reported in the Law Reports of the I.C.L.R., Chancery Divison, 1891; Vol. I., p. 194. In that case it was held that, in considering which is the "front main wall" of a building, and whether such building is "on either side of" or "in the same street" as a building in course of erection, all the circumstances of the case must be taken into consideration. A particular wing or other projection must not be treated as the "front main wall" which is to give the governing line, nor are two buildings necessarily "in the same street" because one faces the same street, or a continuation of the same street, as the other That case does not appear to be quite on all-fours with "Alpha's," which seems a case to be also decided upon its merits.

G. H. B.

New Patents.

These patents are open to opposition until December 18th.

1898.—Radiating Device.—17,438. R. C. Ayrton, Coventry. This invention consists in covering the radiating body, whether of iron or steel, with gills or wings of metal of higher conductivity, such as aluminium, silver, or some alloy of these.

Urinals.—21,019. M. J. Adams, Leeds. Instead of the back being semicircular or angular from the floor upwards, only the lower part is like this, the top part being square or rectangular. This enables the capping to be much lighter and neater.

Levelling Staff.—21,886. A. H. Mountain, Withington, Manchester. The staff is in three parts, the middle and bottom parts being hinged together, and the top part made to slide in a dovetail groove in the middle part. When extended, the parts are held stiff by putting pins through eyes on the hinges. The graduated face of the staff is thus prevented from injury when not in use, and the staff is made more portable.

Combined Centrolinead and T-Square.—22,740. B. Hibbert, London, S.W. This instrument is for drawing the vanishing and (with the aid of a set square) vertical lines of a perspective. It consists of a straight edge about 3ft. or 4ft. long connected at one end to the centrolinead; this has two long arms of equal length jointed in the middle, and attached by two short arms to a nut on a centre bar. Two box knuckle hinges are attached to the drawing board with pins, and have studs between which the arms of the centrolinead work. When pulled one way, the arms become straight and the instrument acts like a T-square, and, when pulled the other way, the arms become angular and enable lines to be drawn that would meet at any desired distance away from the board.

Gate Stops.—22,742. D. Fletcher, Norton. The stop consists of a box containing a system of levers which are operated by the closing of the gate, causing the stop to shoot up above the ground or pavement level; when the gate is opened, the projection drops back again. An automatic slide is provided to prevent dirt getting into the device.

Wood Sawing Machinery.—22 792. J. Kershaw, Hebden Bridge. Rocking arms are employed, hinged on short horizontal arms near the bottom of the bench, and connected with gear for operating and adjusting the feed mechanism. By this method of tilting any angle of feed may be obtained, and can be maintained, whatever movement may be given to the rocking arms by varying thicknesses of timber.

Casements.—23,294. J. W. Moseley, Sale. Within the casement frame, top and bottom, are a pair of hinged arms, and to the ends of these the casement proper is centrally pivoted. By this means the casement can be swung outwards bodily, and revolved for cleaning purposes. No rain or moisture can get in through the joints.

Transporting Bricks.—24,188a. M. Villaret and J. B. Wahlen, both of Germany. The main frame of the truck is made turnable on a horizontal axle, the sleeves swing vertically, and means are provided for lifting and lowering the shelves. The truck can thus be run through the low doors of brick kilns, and the frame can be changed from a horizontal to a vertical position without upsetting the bricks.

Water Closet Seats.—25,565. M. Page, East Ham. At the back of the seat there is a reel of paper (perfumed, disinfected or decorated) of the same width and shape as the seat. It is perforated at intervals and lengths are torn off after use. The invention is particularly adaptable to water closets at railway stations, public conveniences, &c.

Drain and other Pipes,—25,618. R. Whichells, Newcastle-on-Tyne. To prevent the adhesion of solid matters, the pipes are of glass and have an outer coating or casing of cement.

Incandescent Gas Burners.—26,665. J. Jackson, Coventry. The crutch that supports the mantle is held in place by a spring, or set screw, and its position can thus be regulated in order to obtain a maximum incandescence.

1899.—Syphon Cisterns.—8,981. J. W Hancock, senior, Leicester. The inlet end of the syphon is much larger than the outlet, to allow a perforated plate to work up and down inside it. The plate is connected to a rod outside the syphon, attached to a chain-actuated lever. Over the plate is a disc valve. When the lever is pulled down the perforated plate rises and lifts sufficient water to charge the syphon, and so start the flush.

Cements.—12,871. W. Borgolte, senior, Höxter, Germany. The following materials are mixed and burnt in a closed kiln: Limestone, 2 parts; one part each of clay, clay-marl, alumina, and ground coal; and 2 per cent. of a hydro-carbon, such as tar, paraffin, &c. The product obtained is broken and ground, and gives a good glazed cement.

Enamelling Bricks.—15,804. E. P. C. Willems, Schelle, Belgium. The enamel consists of: Silica, 36 parts; alumina, 10 parts; alkaline matter, 7 parts; and metallic oxides, 47 parts. Oxide of tin produces white enamel, oxide of cobalt blue enamel, and oxide of iron black enamel.

Ventilators.—16,365. H. and A. H. Ough, London, E.C. The air is admitted through air bricks or gratings into a chamber containing a screen of butter-cloth or netting which filters it. Beyond this is an adjustable slide. When dirty, the filtering material can be changed.

Fireproof Floors.—16,589. A. H. Bromley, junior, Philadelphia, U.S.A. Ready-made centres are used composed of plaster of Paris combined, if necessary, with papier maché, hair, excelsior, or burlap. They are made without dies or presses.

The following specifications were published on Saturday last, and are open to opposition until December 25th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—20,516, Adams, means and appliances for opening, closing, regulating, and fastening, at any required angle, swing windows, doors, ventilators, fanlights, &c. 24,294, Bennett, manufacture of tiles, bricks, &c. 24,861, Webster, safety devices or guards for circular saws. 25,093, Hannay, swing gates. 25,266, Powey, construction and working of joiners' and engineers' vices. 25,623, Ransome, band-saw machines. 25,746, Christy and Christy, means for electrically heating ovens, hot chambers, rooms, &c. 26,298, Parkes, manufacture of the eyes of hoes, picks, &c. 26,318, May, sliding bolts or bars for fastening doors and apparatus connected therewith. 26,644, Putzeys, pipejoints. 27,000, Sachs, stage floors. 27,146-7, Hervais, drawing pens.

1899.—3,207, Kind, bath and lavatory grating. 6,981, Hett, surveyor's level of the suspended mirror type. 11,838, Todtenhagen and Lemke, radiators or heating pipes for application to stoves, &c., closed fireplaces. 16,212, Burkert, incandescent gas burners with automatic ignition devices therefor. 16,633, McClelland, sand moulding machine. 17,000, Drinkwater, nut locks. 17,241, Langner, mortising or similar machine. 17,431, McKial, sash fastener. 17,591, Gans, blowing or ventilating fans. 17,964, Hadden (*Fugman*), fireproof construction for buildings.

The Organ Case at Westminster Abbey is now complete, and proves a splendid piece of designing and carving. It will be remembered that about £1,400 was raised at the Purcell Bicentenary celebration for the case on the north side over Purcell's grave. The south front was afterwards added in memory of Mr. A. D. Clarke, the munificent donor of the celestial organ; and now the south side has been completed at the expense of the Dean and Chapter.

Keystones.

Devizes Castle, Wilts., built in 1132, is for sale.

A Fine Art and Industrial Exhibition at Newark has been opened.

The Beckett Hospital at Barnsley is proposed to be enlarged at a cost of about £5,000.

Ferdinand De Lesseps' Statue at Port Said is to be unveiled on November 17th, the Khedive of Egypt presiding.

New Board Schools near Haworth have been erected at a cost of about £6,700 from designs by Mr. E. P. Peterson, of Bradford.

The Vaults of St. George's, Southwark, have cost £2,500 to clear; the remains of 1,419 persons have been removed to Woking.

The Church of St. Mary Bredman, Canterbury, is to be pulled down, as its present dilapidated condition makes it a danger to the public.

The New London Hippodrome in Cranbourne Street, Charing Cross Road, is to be opened on Monday, December 18th. Mr. Frank Matcham is the architect.

Dundee Institute of Architecture.—A paper on "Art in the Home" was recently read by Mr. P. H. Thomas before a meeting of the student's section of this institute.

A Memorial to General Sir Penn Symons, who died of his wounds after the battle of Dundee, is proposed to be erected in the parish church of Bothusfleming; a memorial at Saltash, and some token of a national character, are also contemplated.

Church Moving in Glasgow.—St. Bride's Episcopal Church in Beaconsfield Road, Kelvinside, was recently raised by "jacks," mounted on wheels, and removed bodily to a site in Hyndland Road, about a quarter of a mile distant. The church is built of wood, is about 50ft. long, and weighs about sixty tons.

A New Polytechnic Institution.—The Hornsey District Council have decided to present to the Technical Instruction Committee of the Middlesex County Council a freehold site for the erection of a polytechnic institution. The site is close to the free library, fire and police stations, at Tottenham Lane.

Chichester Cathedral.—In consequence of the death of Sir Arthur Blomfield, the sub-committee appointed to make arrangements for the holding of a meeting in Brighton on November 22nd in furtherence of the restoration of the Cathedral at Chichester, have determined that the proposed meeting must be abandoned for the present. Sir Arthur Blomfield was the architect to whom the work had been entrusted, and he was to have been present at the meeting to explain his plans.

How to Paint a Picture.—A Mr. Hay, of Hull, wanted a picture of "a really beautiful lady," and for this purpose he sent to an artist a "Maid of Athens face, from a picture published by Longman's; hair from the Parisian Diamond Company's advertisement, body from Dickens and Jones's advertisement, and bust from the Duchess of Teck." With this material the artist was to paint the picture. He did so, but Mr. Hay was not pleased, and the Judge decided in his favour recently at the Westminster County Court, where the artist seeked to obtain £1 3s. 2d. more than the £10 he had already received.

Royal Scottish Academy.—At the annual meeting of the Royal Scottish Academy last week the following office-bearers were elected for the ensuing year: President, Sir George Reid; council, Messrs. G. Ogilvy Reid, J. Campbell Noble, W. D. M'Kay, W. Beattie-Brown, Robert M'Gregor, J. Lawton Wingate; secretary, Mr. George Hay; treasurer, Mr. John Hutchison; auditors, Mr. P. W. Adam and Mr. W. Beattie-Brown; librarian, Mr. W. D. M'Kay; curators of library, Mr. G. Ogilvy Reid and Mr. Robert M'Gregor; visitors of the life school, Messrs. J. Campbell Noble, W. Grant Stevenson, G. Ogilvy Reid, and Alexander Roche.

A new Board School at Bromley, E., has been erected at a total cost of £41,000.

A Working Men's Institute at Seaton has been built from designs by Messrs. Donald and Tate, of Workington and London.

The Dollis Hill Estate will be converted into a public park as a memorial to Mr. Gladstone. The purchase money is £50,000.

St. Anne's Roman Catholic Cathedral, Leeds, is proposed to be removed to make way for street improvements. It occupies a prominent site in the centre of the city in Cookridge Street.

Whitefield's Tabernacle, Tottenham Court Road, W., just completed, is a red brick and white stone structure, designed by Mr. Rowland Plumbe, who describes its style as "a Victorian rendering of Free Renaissance of the Netherlands."

A New Methodist Church at Belfast is being built on the Oldpark Road from the designs of Messrs. J. J. Phillips and Son. It is 90ft. long and 48ft. wide inside, and will accommodate about 800 persons. The estimated cost of the work is £3,000.

A Royal Palace for Sale.—The Crown lease of Eltham Court and Palace is advertised for sale. Its history dates from the time of Edward the Confessor (1042-66); though the date of its erection is uncertain, it is known that it was a royal residence from 1270 to 1628.

Plumstead Competition.—The authors of the three premiated designs for the proposed municipal buildings and public library at Plumstead are as follows: 1st (No. 3), A. Brumwell Thomas, 7, Queen Anne's Gate, S.W.; 2nd (No. 30), Messrs. Hall, Cooper and Davis, 21, Old Queen Street, Westminster; 3rd (No. 22), Henry Ingle Potter and Sydney W. Cranfield, 19, Lincoln's-Inn-Fields, W.C.

New Companies.

General Land Investment Trust, Limited.

This company was registered on October 21st by D. C. Craigie, Balham, S.W., with a capital of £20,000 in £1 shares, to acquire any land, estates, &c., and to develop and turn to account the same by clearing, planting, draining, or building theron; as brick and tile makers, jobmasters, licensed victuallers, &c.; as dealers, both wholesale and retail, in stone, sand, lime, &c.; as producers and suppliers of gas and electricity; as bankers, financiers, company promoters, &c. The directors are R. C. and D. C. Craigie and W. V. M. Popham. Qualification, £200. Remuneration, £50 per annum each and a percentage of the profits, divisible.

Joseph Grayson, Limited.

This company was registered on October 23rd by Maffey and Co., 19, St. Dunstan's Hill, E.C., with a capital of £10,000 in £1 shares, to adopt and carry into effect an undetailed agreement for the acquisition of the business of a mahogany and general timber merchant as now and hitherto carried on by J. Grayson at Knowl Street, Stalybridge, Chester, and also at Cheetham, near Manchester; to develop and extend the said business, and generally to carry on in all or any of their respective branches the businesses of timber merchants, sawmill proprietors, saw-millers, mechanical engineers, builders and contractors, brick and tile makers, plumbers, &c.

C. O. Fison, Limited.

This company was registered on November 2nd by Tamplin and Co, 165, Fenchurch Street, E.C., with a capital of £10,000 in £10 shares, to acquire the business carried on at Stowmarket, Suffolk, and elsewhere as C. O. Fison, to adopt an agreement with C. O. Fison, and to carry on the business of brick, tile, and pottery manufacturers, quarrymen, &c. The first directors (to number not less than three nor more than five) are S. T. Harwood, W. C. Prentice, and S. Prentice. Qualification, £10. Remuneration as fixed by the company. Registered office: Stowmarket.

COMING EVENTS.

Wednesday, November 15.

Society of Arts.—Opening Meeting of the Session. Address by Sir John Wolfe Barry, K.C.B., F.R.S., Chairman of Council. 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting at 8 p.m.

British Archæological Association.—Meeting at 8 p.m.

Sanitary Institute.—(Lectures and Demonstrations to Sanitary Officers.)—Mr. W. Hunting, F.R.C.V.S., on "Signs of Health and Disease in Animals destined for Food, when alive and after slaughter. Tuberculin and other tests." 8 p.m.

Northern Architectural Association.—Opening meeting of session; address by the President, Mr. William Glover, F.R.I.B.A. 7.30 p.m.

Thursday, November 16.

London Institution. — Mr. George Langley on "Music in its Relation to Painting and Poetry." (Illustrated.) 6 p.m.

Institute of Sanitary Engineers (Incorporated.)—Mr. James Ashton on "Treatment of the Sewage of Wigan" 8 p.m.

Worshipful Company of Carpenters.—(Lectures on Sanitary Building Construction at Carpenters' Hall, London Wall.)—Mr. James Bartlett, M.S.A., on "Setting out Work, and By-laws." 7.30 p.m.

Arts and Crafts Exhibition Society (Lecture at the New Gallery, Regent-street, W.).—Mr. Halsey Ricardo on "The Gothic Revival." 8.30 p.m.

Royal College of Art, South Kensington.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: the Bones and Muscles of the Trunk, and their Surface Forms."

Friday, November 17.

Architectural Association.—(Discussion Section.)—Mr. Robert Williams on "Tenement Houses for the Working Classes." 7 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. W. Hunting, F.R.C.V.S., on "The Names and Situations of the Organs of the Body in Animals." 8 p.m.

The London School of Economics and Political Science.—Mr. Hirst on "Recent developments of the Law Relating to Drainage," II. 7 p.m.

aturday, November 18.

Dundee Institute of Architecture, Science and Art.—Visit to Villa in West Ferry, by permission of Mr. J. Murray Robertson. 2.5 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and Demonstration at St. Marylebone Stone Yard. 3 p.m.

Monday, November 20.

Royal Institute of British Architects. — Dr. A. S. Murray, F.S A., on "Decorative Patterns from Excavations in Cyprus in 1896." 8 p.m.

University College, London.—Dr. Samuel Rideal, on "Processes for the Treatment of Sewage."

Victoria and Albert Museum, South Kensington. —Mr. Hugh Stannus, F.R.I.B.A., on "Historic Evolution of Applied Art—VII. Greek Pre-Christian Art." 6 p.m.

Society of Arts.—(Cantor Lectures).—Mr. Henry Hardinge Cunynghame on "Art Enamelling upon Metals."—I. 8 p.m.

Surveyors' Institution.—First Junior Meeting. 7 p m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Inspection and demonstration at the Metropolitan Cattle Market, York-road, N., conducted by W. A. Bond, M.A., M.D., D.P.H. 3 p.m. Mr. Alfred Hill, M.D., F.R.S.E., F.I.C., on "The Appearance

PUMPS FOR CONTRACTORS' PURPOSES.

By M. POWIS BALE, M.I.M.E.
Assoc. M.I.C.E.

Author of "Woodworking Machinery," "Stoneworking Machinery," "A Handbook for Steam Users," "Pumps and Pumping," &c.

THE selection of a type of pump adapted to the duties it has to perform is a factor of great importance, both as regards its output, economical working, and longevity. It is a point, however, that is sometimes lost sight of, causing considerable loss and annoyance that might have been obviated by exercising a little forethought. This was recently forcibly brought before the writer when examining some steam pumps on a contractor's works that had failed through the valves and slides being cut to pieces by sand; the pumps had been improperly used to get out the water in dock foundations. Pumps employed by contractors are generally subjected more or less to rough usage, and should therefore combine, as far as possible, simplicity, strength and easy access to the working parts. Pumps of complex construction should be avoided, as although these may give higher results theoretically or under certain express conditions, as a rule they are rapidly counterbalanced by breakdown, extra cost of removals, &c.

Centrifugal Pumps.

For ordinary contractors' work, such as getting out foundations, &c., and lifting a large quantity of water to a moderate height, no other form of pump is superior to the centrifugal. It also possesses the advantages of strength and simplicity of construction, moderate first cost, little liability to disarrangement, and ease of erection and repair. Where applicable, it is the best form of pump for irrigation and drainage purposes, emptying docks, &c., as it can be readily fixed in awkward positions, and, having no valves, it is especially adapted for raising water containing foreign matter, as it will pass stones, gravel, sand, leaves, &c., that would soon choke an ordinary pump.

A well-designed and constructed centrifugal pump will discharge a larger volume of water, in proportion to the power used, than any other. It will lift well up to 20ft., but will discharge more water as the lift decreases, assuming, of course, that the speed of the pump is maintained. About 7ft. will be found an effective lift. If, however, the pump can be fixed below the water level, its speed may be increased and a larger discharge secured, but excess of speed is not desirable, as the quantity of water discharged per revolution is lessened.

The general construction of the pump is briefly as follows :—A series of curved blades or discs are mounted on a spindle and made to revolve in a cast-iron case in a similar manner to a fan blower. The revolution of these blades, aided by the pressure of the atmosphere, brings up the water, and it is upon their proper proportion, construction, and arrangement that the effective working of the pump chiefly depends.

To secure effective results, the blades must be so arranged that the water enters the pump with as little friction or shock as possible, and with this object the blades are usually made curved and fixed almost tangentially to the periphery of the pump disc. It may be as well to observe that the loss of power through fluid friction in some pumps of faulty construction is very considerable, the water being churned and eddied round during its passage through the pump, and the evenness of its flow disturbed. With the presumed object of reducing the friction of the water, in a pump of recent design the suction is arranged to enter on one side only of the disc; consequently the water is not split up, as is the case with most pumps of this type, and by removing the centre of the pump disc side thrust on the spindle is avoided. With the same object in view—namely, the reduction of the water friction—pumps are also arranged with a split or branched suction, and the water is made to enter on either side of the pump disc directly opposite its centre, forming a balanced suction.

In the latest practice the foundation of the pump with the standards for the bearings are usually cast in one piece, which gives increased steadiness in working and allows the pump case to be removed without disturbing the suction pipe. The pump casing should be so arranged that the side may be taken off to allow the pump disc to be inspected or cleansed, and hand holes should be fitted with bayonet-pointed covers placed on either side of the suction pipe, so that any obstruction may be readily removed. The curved blades or impellers should be made of steel or charcoal-iron, and, with the disc, be very carefully balanced, or the bearings will wear away rapidly and produce an uneven motion on the water. The pump spindle should be of steel, fitted with a driving pulley of ample diameter and width, and an efficient method of lubricating the bearings should be provided. To dispense with the use of the foot valve, and to save the trouble of charging the pump with water by hand, a small air exhauster is sometimes fitted, and driven from the main pump disc spindle by a belt. In the smaller centrifugal pumps the main body is often attached by a quadrant bracket to the bed plate, which allows it to be swivelled round to any desired angle. This arrangement will be found very convenient for shore work or in awkward situations; at the same time, the joints of the suction or discharge pipe need not be disturbed. The speed of the water through the pipes should not exceed 4ft. per second, as the friction in the pipes increases in the proportion of the square of the velocity.

Rotary Pumps.

Although this type of pump is not used so much as formerly, it possesses some good features. Rotary, or what may be termed revolving piston pumps, in contradistinction to direct-acting pumps, have the advantage of not changing the direction of the flow of the liquid with each stroke of the pump. They can be run at a high speed, and, having no complex valves or leather-packed pistons, cannot readily choke. It may, however, be added that water leakage is a defect found in most rotary pumps, though the efficiency is not so largely reduced as with an ordinary pump. In these cases the speed of the pump may often be increased with advantage.

An excellent rotary pump for steam or hand power, now constructed, consists of five interior parts, four being roller valves arranged to revolve on their seats, which equalizes the wear and renders the pump more water-tight. A novel form of rotary pump has recently been introduced, and appears to give excellent results. In this pump the periphery of the internal drum is divided into four spaces, the two opposite being of the same area and subject to the same pressure. The drum has four blades, which project radially from the centre at equal points, and two of these for one quarter of a revolution are in contact with the wall of the cylinder, during which time they are exposed to pressure on one side only. But during this time the only friction is that caused by the movement of the fluid; during the next quarter of a revolution the blades have an equal pressure on both sides. Each blade acts twice for a quarter of the distance at each revolution, consequently the four blades act for eight quarters, or sweep out the water space twice during one revolution. It is claimed for this arrangement that the pressure is brought into exact equilibrium on all the moving parts, thus saving the loss by friction produced in rotary pumps when the pressure is allowed to act against the side of a drum and drive it against the bearing or abutment, which acts as a brake.

A very good form of rotary pump, especially adaptable for rough work, consists inside of what may be termed a pair of very coarse toothed wheels or wings, geared into each other. The teeth fit against the outer casing of the pump, and as they revolve past the water inlet they produce a partial vacuum, which is filled with water; this is swept forward through the discharge pipe as the teeth, or wings, revolve.

Force Pumps.

When it is necessary to force water to a considerable height, plunger or force pumps must be used. These are made in great variety. For certainty in action and efficiency the writer can recommend the type known as the duplex direct acting, also the fly-wheel pump. In the duplex pump certainty of action is secured and dead points avoided by mechanically actuating each steam valve from the piston-rod of the opposite cylinder, two pumps being placed side by side. Consequently the pumps can start at any point of the stroke, and will deliver a steady flow of water. Each piston is made to pause at the end of its stroke, and the plunger of one pump commences its stroke as the other finishes. Ample time is allowed for the water valves to properly seat themselves without shock. The steam valves employed are flat slide valves, similar to those used in a steam engine, and are found to wear well and give little trouble.

Fly-wheel pumps possess some advantages over direct-acting pumps, notably in the saving of steam when they are worked expansively. Ordinary flat steam valves can be recommended for this form of pump, with the clearance and cushioning as in a steam engine.

Ram or plunger pumps will work with less friction than a packed piston, and are somewhat easier to keep in order. They are well suited for heavy pressures and for gritty water when a centrifugal pump cannot be used. Unlike the direct-acting variety, it is not necessary with fly-wheel pumps that the full pressure of steam should be used throughout the stroke, as the cut-off can be varied to a certain extent to suit the water pressure it has to work against. Again, the stroke being positive and limited by the crank, much less clearance is required in the cylinder. Piston speed of direct-acting and fly-wheel pumps, say, 50ft. to 120ft. per minute, according to duty.

Pulsometer Pumps.

This form of pump has proved itself very useful for rough work and difficult situations in quarries, shafts, &c., as it can be worked suspended by a chain, and easily raised or lowered as required. As the pump has practically no moving parts, wear is reduced to a minimum, and very little attention is required. It, however, uses a considerable amount of steam. Sand, gravel, pebbles, &c., can readily pass through without damaging or clogging the valves, a matter often of great importance in sinking and similar operations.

Steam Water Elevators.

Although wasteful of steam, these are very useful appliances for occasional duty. They operate through the suction or momentum obtained from a jet of steam, and will lift water up to about 20ft., and force about 1ft. high for each pound of steam pressure used. They may be fixed either above or below the water to be lifted.

Hand Pumps.

Many hand pumps of rough and inferior construction are made for contractors' work. A wrought-iron lift pump with a cast-iron barrel is suitable. The suction pipe should be of wrought-iron, arranged telescopically, and the rising main made of rather larger diameter than the barrel, in order that it may allow the pump to be drawn for repairs. If it is required to drive with a hand wheel, the pump rod can be brought through the top of the pump column and attached to a slotted compensating lever, which is itself actuated by a crank attached to the hand wheel. Pump valves of the clack type, made large and free, are suitable.

Chain Pumps.

These are suitable for rough usage, lifting muddy water, &c. The pump consists chiefly of an endless revolving pitched chain carrying a series of iron discs. These descend into the water, and on their upward journey pass through a tube, carrying the water with them. The pump can be adjusted to suit different depths, and can be driven by hand or power. The back fixed barrel should be made slightly larger than the front, so that there may be less liability of the lifting discs fouling on their downward journey. They should have a clearance of from $\frac{3}{16}$in. to $\frac{1}{4}$in. Discs of chilled iron are suitable, hollowed a little, made wide on the edge, and slightly rounded on the top. Excess of water is prevented from running back, and the pumps may be run at a higher speed than usual without splashing. To prevent splashing these pumps are often covered in.

Suction and Delivery Pipes, &c.

Suction pipes should be of ample size, as straight as possible, and perfectly air-tight. Wrought-iron pipes are preferable, and if bends are necessary they should be of as large a radius as possible. In cases of long suctions or heavy lifts, foot or retaining valves should be fitted; in fact, it is better to fit them in all cases, as they keep the pump charged with water. The diameter of delivery pipes should be uniform, whether they are long or short. When pumps are working under heavy pressure it is a good plan to fit an escape valve to the delivery side of the pump, as it relieves the pump from strain in case there should be an obstruction. A check valve should always be fitted in the delivery pipe to relieve the pump from back pressure when starting, or when taken apart for adjustment or repairs. If the pipe is a very long one, its diameter should be increased in proportion to allow for the increased water friction, but bends, angles, &c., increase the friction much more rapidly than length of pipes.

Westminster Hospital has been reopened after being closed to out-patients since last July. Electric light has been put in, cleaning and painting has been done, and another storey is being added to portions of the east and west faces of the building. The alterations will cost about £11,000.

Church Spire Destroyed by Lightning.—During a thunderstorm which broke over Eskdale and Liddesdale last week the lightning struck the spire of the parish church at Rockcliffe, standing 170ft. high, wrecking it down to the belfry. Great stones were thrown tremendous distances, damaging property one hundred and fifty yards off. The church was also greatly damaged.

Rotherham Sewage Works.—The memorial stone of the Rotherham Sewage Outfall Works, estimated to cost £55,000, was laid recently by Lieutenant-Colonel Hirst, the chairman of the Corporation Sewage Committee. The works are at Aldwarke, near Rotherham. The engineer is Mr. R. E. W. Berrington, of Wolverhampton, and the contractors are Messrs. Braithwaite of Leeds. The system adopted includes bacteriological filters and land treatment.

Improvements at Leicester.—A Local Government Board inquiry has been held into the applications of the Leicester Corporation to borrow £33,100 for the construction of a wholesale market, £13,308 for street improvement purposes, £5,640 for sewerage and storm water drainage, and £326 for the purchase of land for a branch fire station. It was explained that the money for street improvement was mostly required in connection with the plan for widening High Street, which is being carried out at a cost of over £100,000 to meet the increased traffic.

New Sanatorium for Burnley.—A new sanatorium, which has been built at Burnley at a cost of £20,000, was opened on Saturday. The institution is for the treatment of infectious diseases, and has been constructed jointly by the Burnley Corporation, the Burnley Rural District Council, Padiham Urban Council, and Brierfield Urban Council. Seven acres of land have been enclosed, and the buildings at present comprise fever pavilion, isolation pavilion, administration block (for doctors, nurses, &c.), laundry, mortuary, and porter's lodge. The whole of the work has been carried out from the designs and under the direction of Mr. F. S. Britton, engineer, Burnley.

Masters and Men.

The Greenock Slaters struck work last week for an advance of $\frac{1}{2}$d. per hour upon their present wage of $8\frac{1}{2}$d. The demand was quickly conceded, and work has been resumed.

Strike at the Simplon Tunnel.—The workmen employed on the Simplon tunnel have decided on a general strike, the employers having refused to recognise their demands.

Building Trade Dispute at Blackpool.—As a result of the notice served six months ago, a number of masons employed in Blackpool are now idle, with a view to resisting the masters' proposed reduction of a farthing. The exact number is now twenty-six, though a large number have had the amount in dispute conceded to them. Seventy-five per cent. are working despite the dispute prevailing. The strike is rather inconvenient for Blackpool, where the building trade is brisk in winter.

Boilermakers' Society.—Messrs. D. C. Cummings (Leeds) and James Conley (Glasgow) were the two candidates for the office of the general secretary to the Boilermakers and Iron and Steel Shipbuilders' Association, vacated by the retirement of Mr. R. Knight. Mr. Cummings, who was elected by a majority of 559, is a Yorkshire district delegate, and is still in the prime of life. His opponent is a district delegate for Scotland. The ballot was as follows:—Cummings, 18,389; Conley, 17,830.

Strike of Scottish Carters.—The carters at Paisley in the employ of the North British Railway contractors for the district, and another firm, to the number of fifty, and about twenty men employed by Messrs. Cowan and Company of the North British Railway, at Coatbridge, have struck work for an advance of 1s. per week. Over seventy men in the employ of Messrs Wordie and Co., and Cowan and Co., at Falkirk, also struck on a demand for an increase of 1s. per week on ordinary days, and an advance of 6d. per horse attended on Sunday. The men put in their demand the previous week, and were informed that the 1s. advance would date from the beginning of last week, and not on the day it was asked. This was how the strike arose, but it has since been settled by their accepting the masters' terms; the Sunday advance was not insisted upon.

Strike at Glasgow.—The employes of the Port-Glasgow Cleansing Department, numbering six carters and nine scavengers, struck work last week. A deputation waited upon a sub-committee of the department and raised the following points:—(1) 6d. per day rise in wages for all workers; (2) ten holidays and pay in each year; (3) double time for Sunday labour, and time-and-half for all overtime; (4) a fifty-one hours' week; (5) that in cases where men's work is changed for a short time wages be unaltered; (6) that arrangements be made so that street and close men can leave their brushes, pails, and shovels in safe places of concealment in their beats while reporting at the depôts and during meal hours; (7) that the present system of fining for trifling offences be abolished; (8) that the extra work imposed on close men of having to sweep the gutters on their beats be abolished; (9) that wheelers receive an increase all round of 2d. per ton. The men have returned to work in consideration of receiving an increase of 1s. per week, on condition that the new Town Council will reconsider their terms.

Trade Unionism and Wages.—A resolution was passed some years ago by the Gloucester Guardians providing that all contractors under the Board should pay the trade union rate of wages. This has now been rescinded. In discussing the matter at a recent meeting, Mr. H. G. Ford admitted that at one time trade unions were necessary to break down monopolies which in some cases existed; but the unions, after doing that, set up monopolies which were more tyrannous than those they had sought to overcome. Moreover, such a resolution prevented men who were getting on in years, and unable to work so quickly as those who were younger, from obtaining employment, because employers could not afford to pay them the standard rate of wage. Mr. Miles argued that it was unfair to tradesmen who paid a fair wage for the Board to give work to those who did not, and maintained that trade unions, by keeping a fair rate of wages, kept men off the rates, and the resolution ought, therefore, to have the hearty support of the Board.

Joiners' Dispute at Cardiff and Barry.—The joiners employed in ship-repairing works at Cardiff and Barry struck last week with the object of obtaining the introduction of a new code of working rules and an increase of wages amounting to 1s. per week. The men's demands have been considered by the Employers' Federation, but are still resisted. The number of men affected is small, and these have probably obtained employment in the building trade, as they are all members of the Carpenters' and Joiners' Society. The dispute has been in progress for some months, although it is only since the end of last week that a crisis has been precipitated. The employers treat the matter with comparative indifference, inasmuch as they have little or no work for the joiners to do. It is estimated that not more than sixty men are affected by the present dispute. Some time ago the employers and men agreed upon alterations in the old code, but subsequently the latter withdrew, and called for the ratification of a new code, and hence the present trouble.

Leeds Building Trade Dispute Settled.—The differences existing between the Leeds Master Builders' Association and the local branch of the London Order of Bricklayers have at last been satisfactorily adjusted. It will be remembered that in May last the men applied for an advance of a penny an hour, which the masters refused to grant. Since then representatives of both sides have met in conference, but without arriving at any agreement, the men declining to accept an offer of $9\frac{1}{2}$d. per hour, being an advance of one halfpenny. Last Thursday, however, a deputation consisting of three members of the order waited upon the committee of the Masters' Association at the Builders' Exchange Club, Duncan Street, and intimated their willingness to take the proffered increase. A deputation of three members of the Manchester Order of Bricklayers, who recently gave notice for a halfpenny advance, were also received, and it was resolved to accede to the request. The increased wages will, therefore, be paid to the members of both orders from May 1st next. Both deputations also consented to abide by the 1896 rules. The meetings were presided over by Mr. W. H. Dews, president of the Builders' Association.

It is proposed to light Cleckheaton by electricity.

An Electric Railway between Manchester and Liverpool is a scheme for which a syndicate, with a capital of £40,000, is now being formed.

The New Public Hall at Pitlochry (Messrs. John Bruce and Sons, of Dundee, architects) has been ventilated by means of Cousland's improved "Climax" patent direct-acting Louvre ventilators and air inlet tubes, supplied by the "Climax" Ventilating and Heating Company, Limited, of 93, Hope Street, Glasgow.

Newport (Mon.) Improvements.—The Bill which is to be introduced into Parliament next session asking for powers to use electricity on the overhead trolley system as traction power on the tramways will involve an expenditure which is estimated at £120,000. The Corporation also intend to go to Parliament for powers to construct a new transport bridge (the invention of a Frenchman, M. Arnodin) over the river. This is estimated to cost £64,000.

Builders' Notes.

Jarrahdale Jarrah.—The "Fredsael" has arrived in London with 850 loads, and the "H. W. Palmer" in Sunderland with 340 loads of this wood, to the order of the agent for the Jarrahdale Jarrah Forests and Railways, Limited, of 1, Fenchurch Avenue, London, E.C.

Renovating Daly's Theatre, London.—In consequence of the re-opening of this theatre, the fan scaffold had to be cleared away, Palmer's travelling cradles being employed to finish the repairs to the stone facings, which were afterwards coated with a preservative fluid.

A Hint to Master Builders.—At the annual conference of the National Association of Master Plumbers of Great Britain and Ireland, held at Leeds last Wednesday, the president (Mr. John Skirrow) said it would be better for all concerned if master builders would fall into line and let each trade manage its own affairs.

Cumberland Green Stone.—Visitors to certain parts of Cumberland are well acquainted with the fact that the county possesses a very excellent red sandstone in the neighbourhood of Aspatria, *inter alia*, and now we are told of a very effective green stone which the Buttermere Slate Co., of Keswick, are working chiefly for decorative purposes, and which is found to be specially suitable for use in conjunction with the sandstone. It is employed for mullions, quoins, heads, sills, fenders, &c. The colour has the advantage of gaining greatly in appearance when wet, a feature which, in the Cumberland climate, is significant.

London County Council.—At their meeting held on November 7th it was decided to introduce a Bill in the coming Parliamentary session to purchase the undertaking of the eight London water companies; an amendment to the Bill for the supply of water from Wales, to be introduced next session, was rejected. It was resolved to seek powers to acquire the garden of Albert Square, Commercial Road, E., for the purpose of public recreation, and to obtain powers to enable the vestry of Hampstead to contribute £1,000 towards the cost of the acquisition of the Dollis Hill estate. Some discussion took place on the proposal of the Parliamentary Committee to obtain power to enable the vestry of Battersea to erect dwellings for the working classes on a portion of the Latchmere allotments, and to lay out the remainder as a public open space to be maintained by the vestry; but the recommendation was adopted.

Relief Painting on Wood.—Decorator Painter Wilhelm Plinwald, of Stuttgart, has taken out a patent for an invention which admits of producing ornaments in relief on wood or stone as quickly as they can otherwise be drawn or painted. When the priming only is done a wood-colour or a coloured glaze needs to be applied. The new process, says the "Scientific American," is carried out as follows: Add to suitably-diluted size enough chalk so that the mixture can be dabbed upon the surface to be decorated. The lower ground may consist of any material, as wood, stone, or gypsum. After six or eight applications and rubbing down or smoothing a layer of about five millimetres in thickness is obtained. The rubbing down is best performed wet, with pumice-stone, whereby all air-pores are closed up, and a nice smoothness results. Upon the surface thus created an ornament is applied by hand or with a stencil in moderately thick lines, and with not too fat a paint, in order to prevent it from running off. After the drying of the paint, all the uncovered places of the surface are treated with sponge or brush and softened water, to which a little potassium bichromate is added. The result will be that the ornament put on with fat paint will remain raised, while everything else is washed away more or less deeply through the treatment. Hence a flat-relief ornament is created, which, treated with colours after drying, presents a much more favourable effect than the imitations attempted by shading. The bichromate of potassium added to the water penetrates very deeply into the mass, eventually taking away its perviousness to water.

The London County Council's Mistake.—In the Metropolitan Tribunal of Appeal sitting at the Surveyors' Institution on Friday, a sum of £50 was awarded to an appellant against a decision of the London County Council. It appeared that Messrs. Curnick and Co. applied to the London County Council for sanction to certain plans for the rebuilding of Nos. 60 and 62, Regent Street, and Nos. 7 and 9, Glasshouse Street, St. James'. The Council refused to sanction the plans, but later (according to the counsel for the County Council) it was found that the application did not require the sanction of the Council, and that the refusal of that body was of no importance. The applicants not knowing this were put to the trouble of appealing, and at the sitting of the tribunal on Friday the Council withdrew from the position they had taken up. It was shown that the Act of 1894 did not apply to the case under notice, and that that being so the refusal of the Council had no force. In the end the County Council agreed to pay the appellants the sum of £50 in consideration of the inconvenience caused, together with costs.

A Claim for Injury.—In the case of Pavis v. Wills recently heard in the Queen's Bench Division of the High Court of Justice the defendant was a builder who was building houses at Winstead Road, Battersea, S.W. He employed various sub-contractors to do different branches of the work—*e.g.*, for bricklaying, slating, building manholes, plumbing, &c. The sub-contractor for bricklaying was named Manhire. Manhire constructed the scaffolding with the defendant's materials, and the Court found that at the time it was constructed the scaffolding was sufficient. Manhire having completed the brickwork, the scaffold remained up for the use of the other sub-contractors, until Manhire could do the pointing. During that interval the plaintiff, who was employed by Jackson, a sub-contractor employed by the defendant for building manholes, was passing under the scaffold on his way to his work, when a slate fell through the scaffold and injured his thumb, disabling him for four months. It appeared that when the scaffold was put up it consisted of five planks and a guard board. Some one removed three planks and the guard board. There was a heap of slates upon the scaffold, and it was one of these slates which fell upon the plaintiff. At that time Manhire was not engaged on the job. The plaintiff brought the action against the defendant to recover damages for the injuries he had so received. The County Court Judge (after two trials) gave judgment for the plaintiff. The defendant appealed.—The Court held that the appellant was liable. He was not only the person who had contracted with the bricklayer for the construction of the scaffold, but he was also permitting it to be used by the other contractors so far as they had to use it in their work, and permitting it to remain on the premises upon which they were carrying out work in which he was interested. In this sense he was possessed of it, and if he did not actually provide it in the first instance, there was evidence from which it might be properly inferred that he adopted it as provided for him and allowed it to be used by them and to be there while they were working. Under these circumstances the rule stated in "Heaven v. Pender" applied, and the appellant therefore was liable. The appeal was dismissed.

"Rushing" up a Building.—An action was recently brought in the Queen's Bench Division of the High Court of Justice by Messrs. J. Chessum and Sons against Mr. Herbert Huntley Gordon to recover £5,934 8s. 3d., alleged to be due in respect of buildings erected by the plaintiffs for the defendant under certain agreements, and for damages for the breach of these agreements. The defendant denied that he made the first agreement, and counterclaimed for damages for alleged breaches of the second. In December, 1897, the plaintiffs, who are builders and contractors, entered into a contract with the defendant to erect for the latter, for the sum of £7,500, a large block of buildings called Stafford House, between Bread Street and Cannon Street, London. The defendant, who had recently bought the site of the buildings, was his own architect. The contract provided that the ground floor of the buildings should be completed by March 25th, 1898, and that the whole should be completed by June 24th, and penalties were provided in case of delay. There was a good deal of friction in the course of the building, chiefly on the subject of extras, but the building proceeded. The defendant desired to carry his building higher than the buildings which formerly stood upon the site, and he believed that if he could succeed in carrying the buildings up beyond the old height before an injunction were obtained against him for infringement of ancient lights by the owners of the property on the opposite side of Bread Street, the Judge would be reluctant to compel him to take them down, and would only order him to pay compensation. He went abroad on March 27th for a holiday, but prior to this he had instructed the plaintiffs' foreman, as soon as the old height was reached, to rush up the work. He also left instructions with his solicitor, Mr. Danvers, to deal with difficulties as they arose. On April 7th Mr. Danvers, purporting to act on the defendant's behalf, entered into a new agreement with the plaintiffs, by which it was stipulated that they should rush up the wall opposite Bread Street, in consideration of which it was agreed that no action should be taken in respect of the plaintiffs' failure to complete the buildings by the time stipulated, and that the plaintiffs' claims as to extras should be admitted. The wall was accordingly rushed up. An injunction was, however, afterwards obtained against the defendant, who was compelled to pull down the wall so far as it exceeded the former limits. The defendant repudiated the agreement of April 7th, 1898, when it came to his knowledge, and in May he evicted the plaintiffs from the works on the ground that they had not complied with the contract of December, 1897. The plaintiffs now claimed the amount alleged to be due in respect of the work done by them, together with damages for the injury to their reputation by reason of the eviction. The defendant's case was that when he went abroad he had no reason to suppose that the critical time when the buildings would have reached the height of the old buildings would arrive before his return, and that no authority was given by him to Mr. Danvers to deal with the matter of rushing up the buildings; but that his authority to that gentleman was limited to dealing with the disputes which had arisen as to extras. The defendant's counter-claim was for the loss he had sustained by reason of the injunction. Three issues were ordered to be tried—(1) whether the supplemental agreement of April 7th, 1898, was valid and binding on the defendant; (2) whether the eviction of the plaintiffs was wrongful; (3) the amount of damage done to the plaintiffs' reputation by the eviction. The first of these issues was the only one now tried. The jury, having been asked whether Mr. Danvers had authority to make the agreement of April 7th, 1898, replied in the affirmative. It having been conceded that in this event the eviction was wrongful, the issue relating to that matter was dropped, and the remaining issue was referred to Mr. Herbert Steward, the arbitrator agreed on by the parties, who was instructed to find the total amount due to the plaintiffs.

Tunbridge Wells proposes to largely extend its electric lighting system.

Engineering Notes.

An Underground Electric Railway for Manchester is proposed.

Improvements at Warrington. — The Corporation propose to spend £44,966 on electric lighting, and £9336 for the provision of a central sanitary depot at Parr Street.

Survey for the Nicaragua Canal.—Admiral Walker and fifteen engineers have sailed for Bluefields to make a new survey of the proposed route for the Nicaragua Canal.

Mr. W. E. Mather, elder son of Mr. William Mather, and a director of the well-known engineering firm of Mather and Platt, has died as the result of being thrown from his horse.

A Lighting and Traction Scheme at Llanelly is estimated to cost between £80,000 and £100,000. The Council will enter into an agreement with the British Insulated Wire Company, Limited.

The National Telephone Co.'s New Premises have been fitted with an entirely new installation for the complete warming and ventilation by Messrs. John King, Ltd., of Liverpool. "Rajah" ventilating radiators are used.

The New Fever Hospital, Cape Town, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, descending smoke flues, patent Manchester grates, and under bed ventilators, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Most Ancient Machine Tool.—There can be very little doubt (says a writer in "Cassier's Magazine") that the potter's wheel represents to-day the most ancient form of machine tool known. Among the many sculptured records of the trades and occupations which so vividly represent the customs and habits of the ancient Egyptians, the potter and his wheel have been found frequently depicted, and it is curious to note that through the almost countless generations since that time this crude type of lathe has undergone no material modification. It is curious, too, that in none of these ancient records are there shown examples of the forerunner of the common turning-lathe as we know it to-day, even though the art of turning may be traced back to a very remote period. Among Egyptian antiquities that have been found at Thebes and other cities there have been many specimens which exhibited indubitable signs that the material, while in revolution, was subjected to the action of a tool held at rest—legs of stools and chairs, for example, and lamps and musical instruments—and in later centuries, among the Greeks and Romans, the lathe was undoubtedly in common use. Cicero and Pliny both refer to the art of turning, and Herodotus thus uses the lathe as a familiar simile: "But I smile when I see many persons describing the circumference of the earth, who have no sound reason to guide them; they describe the ocean flowing round the earth, which is made circular as if by a lathe." Unfortunately, however, it appears that none of these nor other early writers have left any account of the lathes and tools employed by their contemporaries.

Surveying and Sanitary Notes.

A Motor Dust Van is to be given a two weeks' trial by the Strand Board of Works. It was estimated that a motor cart weighing three tons would save £232 a year in the cost of dust collection and street watering.

Whitby Improvements.—It is intended to erect a public lavatory at the foot of Kyber Pass at a cost of about £1,181, and to spend £212 on improving the sewerage of the village of Ruswarp. It is also intended at an early date to erect a public shelter in connection with the lavatory.

Sanitary Inspectors.—The next examination for sanitary inspectors under the Public Health (London) Act, 1891, will be held at the Examination Hall, Victoria Embankment. The preliminary examination will take place on Tuesday, December 5th, and the technical examination on Thursday, Friday, and Saturday, 7th, 8th, and 9th December, commencing on each day at 10 o'clock a.m.

The Main Drainage of London.—Serious complaints have been made for some time past of the insufficiency of the main sewers in various parts of London, and the attention of the London County Council has frequently been directed to the dangers arising to public health from the periodical flooding of dwelling-houses and other buildings with storm water and sewage. At its first meeting in December the London County Council will consider an important report from its Main Drainage Committee. Strong representations on the subject have been received from twenty-three local authorities. The success which has followed the Council's operations in the past in improving portions of the sewerage system at a capital cost of £1,143,402 during the ten years ending March 31st last, is a fact on which, the Committee think, the Council may well congratulate itself. The main drainage system was constructed by Sir Joseph Bazalgette to serve 3,450,000 persons, with an average water supply of 31¼ gallons per head, whereas it now serves 4,700,000, or 36 per cent. more persons, with a water supply of from 35 to 40 gallons per head. The population is increasing at the rate of about 400,000 persons in every ten years, and will, in all probability (the Committee say), amount to a total of 7,000,000 within the County of London when it is fully built over. The dry-weather flow of sewage for which the system was designed was 108 million gallons daily, whereas the quantity now passing may be taken at about 195 million gallons daily, or an increase of about 80 per cent. The northern low-level sewer was not designed to take any of the sewage west of Chelsea, as it was intended to discharge it after treatment into the Thames somewhere near Imperial Road, Fulham; and, as regards the area south of the Thames, the whole of the drainage amounts in dry weather to about 80 million gallons daily, and all this quantity has to pass through the only existing sewer between Deptford and Crossness. The Committee have come to the conclusion that works "must ultimately be carried out" that will involve an expenditure of about three millions sterling. For the present, however, they merely recommend the construction of two additional outfall sewers, each 9ft. in diameter, between the Abbey Mills pumping station and the Barking outfall, and the construction of an additional outfall sewer, of 11ft. 6in. diameter, between the Deptford pumping station and the Crossness outfall works. These sewers, which involve an outlay of £1,250,000, will take about eight years to complete.

Trade and Craft.

ELECTRIC LIGHTING.

We have received from Mr. G. Braulik, of 217 and 218, Upper Thames Street, London, E.C., the sixth and latest edition of his catalogue of electric light supplies, section "L." This includes switches of all kinds, distributing boards, testing instruments, meters, cut-outs, roses, plugs, casings, accumulators, &c., and is, in fact, comprehensive. In consequence of the great increase in his business, Mr. Braulik has enlarged his premises and stock, so that large orders can now be executed with every dispatch, a very appreciable merit. Some of the large switchboards illustrated in the catalogue are very well designed, and have a good appearance. There are also shown quick-break knife switches, main switches with laminated contacts (these are of best English workmanship, and the finish is guaranteed), multiple contact resistance switches, accumulator switches of various kinds, and innumerable varieties of tumbler switches (including a patent suspension tumbler switch). On page 39 some fancy switch covers of very pleasing design are shown. The new combined bolt, indicator, and switch, for water-closets, should be found very useful, as the simple turning of the handle bolts the door, indicates that the apartment is engaged, and switches on the light. Mr. Braulik's new Serpent bayonet lamp-holders are suitable for ordinary or high tension, and are easily fitted. They are made in polished brass or bronze. Voltmeters and ammeters form another prominent feature in the catalogue, and all varieties and sizes are illustrated. The patent dynamo brushes shown on page 106 are made of finely crimped copper wire, compressed into a special gauze covering, and do not spread on the commutator. The latter part of the catalogue is devoted to heating apparatus, and includes such things as electrically-heated soldering irons, glue pots, kettles, cooking and domestic appliances, and radiators. With regard to the last, there is illustrated an ornamental screen radiator of highly ornamental design that can be moved about as desired. It looks exceedingly well, but is only made to order. Section I. of the electric light catalogue, dealing with all kinds of lamps, has also been sent to us. Both catalogues are well printed, and should be handy for reference. In addition to his London premises, Mr. Braulik has a Manchester branch at 22, Blackfriars Street.

COMPLETE LIST OF CONTRACTS OPEN.

PRESS OPINIONS.

"THE ENGINEER" says of No. 4:

"The field embraced by this issue appears to grow with each half-yearly issue. No. 4 contains over 700 pages, and we note that the compilers are alive to the necessity of collecting together in separate divisions all information, although not quite of a kindred nature, yet likely to be sought for by men of a particular profession. For instance, 'Hygienic Engineer,' 'Roadmaker,' and a new miscellaneous section have been incorporated into one division, entitled 'Municipal Engineer.' The labour involved in the production of such a publication must be immense, and it is to be hoped that it will meet with a commensurate reward."

"ELECTRICITY" says:

"SPECIFICATION No. 4 maintains its reputation as an architects' and engineers' compendium. The present issue has been corrected and brought up to date, and yet further enlarged. The various sections have been written by men whose names are a guarantee for their thoroughness."

"THE SURVEYOR" says:

"It is really impossible to give an adequate idea of the book by means of a notice. It is a professional library in one volume, and its scope and value can only be properly appreciated by an actual examination. We are safe in saying that to see it is to feel a strong desire to possess it. There is a strong list of contributors, and the numerous illustrations form one of the strongest features of an excellent compilation, the production of which must have involved no small labour. There are over 700 pages, and the price is only 5s. nett."

"THE IRONMONGER" says:

"The work will be found of great value."

"ENGINEERING" says:

"The remarkable publication, 'Specification.' . . . . . should prove extremely useful."

An Architectural Causerie.

Petersham Woods. THE tiny rural village of Petersham, ten miles distant from London, remains to this day as secluded as any village in Surrey, although on the borders of the now populous town of Richmond. The parish extends over the great area comprised between Richmond on the east, and Ham on the west, and stretches from the Thames on the north over the whole of Richmond Park to the south. Notwithstanding this territorial size, it still contains a population of only some six hundred and twenty persons. Eight years ago, or thereabouts, the inhabitants of Petersham were so ill-advised as to agree to being incorporated with the new municipal Borough of Richmond; but to-day those ardent persons who voted for incorporation only too bitterly deplore their enthusiasm, and wish their work undone, for Richmond has ever proved an aggressor and an encroacher upon the rights and rural beauties of this sole remaining one of the rustic villages that once surrounded London. The latest scheme is for the "appropriation and regulation" of Petersham Common. Called usually "Petersham Woods," this hillside tract of densely-wooded common land is well known to cyclists, for it borders the lower road from Richmond to Petersham village, and extends from the level meads to the crest of the Hill and the "Star and Garter." Ancient oaks and elms, many of them romantically shrouded with venerable ivy, make up this woodland, and thick tangles of natural and undisturbed undergrowth render it unique, now that "improvements" have improved away other wild woods of the Home Counties. Richmond Park itself contains nothing to rival the rich luxuriance of these tangled thickets, where wild birds nest and the nightingale sings throughout the summer nights. It is the ambition of the Richmond Corporation to clear away these coverts, and to cut down trees to form paths: in short to spoil this hitherto unspoiled spot and to make it as much like a park as possible. If it were readily to be done, they would level the Hill, too, for your true grocer or butterman, elevated to the representation of some ward on a town council, hates natural inequalities of surface. Unhappily, unless these corporate Perkin Middlewicks can be educated, the wildness of Petersham Woods is doomed, for the Board of Agriculture has given the Richmond Corporation the control of the Common. Petersham, which is represented on the Council, and the Earl of Dysart, as Lord of the Manor, have the power of appointing conservators, but Richmond has been given the greater representation, and those who hold a brief for the preservation of Petersham Woods in their natural beauty can always be easily outvoted. C. G. H.

PETERSHAM WOODS. DRAWN BY C. G. HARPER.

The Wayfarer's Discovery. FOR a reason best known to himself the Wayfarer decided last week that the saying "Except a man work, neither shall he eat" applied even to him, and that, if something was not done shortly, he would be in a tight corner. With a reluctance born of a disinclination to work except under great provocation, he eventually decided that in tracing it was possible to cover the largest amount of ground with the smallest expenditure of brain tissue. Arriving at this sensible conclusion, he cast about for a means of getting that kind of employment on the most lucrative terms. After sampling a number of architects without success, he came across a place in one of the quiet inns of the West End where his reception was more encouraging. In answer to his timid knock at a door on the third floor landing, the Wayfarer was brought face to face with a young man of a cheerful and enquiring countenance: alert, and quite sure of himself, his gaze, frankly critical, swept over the visitor. Who is this person it seemed to say. "Do you want a neat tracer?" asked the Wayfarer hurriedly, and then blushed as if he felt it was really going too far in suggesting that he was neat. "Just take a seat and wait a minute," answered the young architect, and vanished into a room on the right. The door opened again in a moment or two, and the cheerful person reappeared, saying, "Come in; we will see what we can do for you." Once inside, hope began to find a place in the Wayfarer's heart. A number of drawings lying about in a state of confusion promised much, and to the question put by the other partner (for there were two of them), "Can you trace for sunprinting?" he answered boldly, "Yes, sir," although quite in the dark as to what sunprinting might be. "Well, then, just make a good tracing of the west end of the building, and keep your lines fairly thick. See! you might take this as a copy," pointing to a well-inked-in ½in. detail. Having obtained work the Wayfarer settled down to a leisurely cleaning of his drawing instruments. This being done, he took stock of his employers and surroundings. A pleasant office, thought he, but rather queerly furnished. Why is the picture rail close to the skirting, and why do the principals talk in such a bantering strain of a new art movement? What is this new art movement, said the Wayfarer to himself, beginning to trace the detail? Perhaps I am on the verge of a discovery. Who knows? And as he listened more attentively to the conversation the ink ran out of his pen, making a huge blot on the tracing linen, which was not exactly a good start for a neat tracer, but it was soon licked out of existence with an ease that could only be the outcome of a wide experience. Looking at the tracing again—and this time more attentively—he discovered that the design was of a kind quite unfamiliar to him. It was so plain, it might even be called ugly, but at least it had the merit of being interesting, fresh, and unusual. This must be the new art movement, thought the Wayfarer, stopping his tracing, so overcome was he with the joy of having found some new "ism," some new thing upon which to centre his emotions. Recovering himself he traced savagely until tea-time, making up his mind to devote several hours during the next week to formulating a scheme for the running of new art movements all over the country, but he first must learn more of the true inwardness of the New Art.

G. LL. M.

Civil Service Appointments. AT a time of the year when architects are reducing the number of their assistants, owing to a natural falling off in the amount of work to be done, it is only natural to find an increase in the number of the unemployed, of whom some are asking themselves whether more permanent employment cannot be obtained. Of these a certain proportion annually elect to commence practice on their own account. Others are debarred from doing so, and from thus realising the true object of their many years of training; they lack either the means or the influence or the temperament necessary for the successful conduct of independent business. To these, and they are many, the permanent appointments of a technical nature in the various branches of the Civil Service have a considerable attraction. The same energy of character as is requisite for the rough and tumble life of a practising man is hardly necessary, while a solidly satisfactory draughtsman, designer, quantity surveyor, or civil engineer is at a premium. True, entrance to the permanent staff is only to be obtained by success in a severely competitive examination against other highly-trained and competent technical men, none being admitted save such as have served in the office of an architect or civil engineer for a period of several years; but as the age limits are wide—generally twenty-one to thirty—there is fair hope of success being achieved by a worker, if he commences early enough, at his second or third if not at his first attempt.

The three principal departments in which such appointments are obtainable are the Admiralty (assistant civil engineers and assistant surveyors), the War Office (assistant surveyors), and the Office of Works (assistant surveyors and assistant examiners), but there are many other departments having a small technical staff recruited by occasional examinations as vacancies occur. In almost all instances, whatever may be the official title of the appointment, architects' assistants are eligible to compete, and will not infrequently stand as good a chance as will civil engineers. With regard to pay, the initial salary is equal to and generally much better than that obtainable in a private office, with the advantage of steady increase throughout service and a pension on retirement at the age of sixty-five, with sufficient but rarely excessive work or responsibility, and absolute security against dismissal save for flagrant misconduct. On the other hand, the successful candidate must be content to sink his individuality entirely, to become a mere unit in a vast machine, and, in one department at least, to suffer social ostracism. This last is a very serious disadvantage, often only half realised by young men when first they enter, but brought bitterly home to them in after years, especially if they be gentlemen by birth, as most of them are, and married to ladies of their own position, and the department in question has been for many years steadily sinking in the estimation of candidates, with the likelihood of its sinking still further unless some drastic reforms be made. In the other departments the life is at least tolerable, in some distinctly so, and men of sufficient ability, who at the same time are unlikely to succeed in practice, are justified in striving to enter them. To many, however, the strenuous life of him who has to seek as well as to earn in daily struggle will always seem more manly and more noble than the methodical work of a salaried servant, even of the Government.

G. A. T. M.

On Reflection.

The Housing Problem Again. THE first step in the carrying out of any reform is the recognition of a need for reform. By this we do not mean merely the lazy admission, which everyone is willing to make, that "something ought to be done," but the strong determination to find a remedy for the evil, if a remedy exists. That first step has at length, we may fairly claim, been taken in regard to the question of the housing of the working classes, to which we have so frequently adverted in these columns. In spite of the preoccupation of the public in matters of colonial and foreign policy, the question has come distinctly to the front within the last few days. Lord Rosebery, Mr. Ritchie, Mr. Asquith, and Sir Henry Campbell-Bannerman have all been devoting attention to the subject, and all have recognised its extreme urgency and importance. "Here is a grievance," said Sir Henry Campbell-Bannerman, "to which the complaints of the Transvaal Outlanders are a mere empty cry. Here is a peril at your own doors greater than can come from any Boer aggression. Here are destruction and misery exceeding that of war working and waxing in the houses of your own people." These are strong words, and we welcome them, not for their reference to a current controversy, but for the assurance they afford that the housing problem has now entered the domain of practical politics, and will be pressed to a definite issue—at any rate if one of the great parties in the state has its way. But in truth this is not a party question, and we hope it will never degenerate into a subject for barren political controversy. The problem is large enough and urgent enough to demand the best energies of the best men of all parties, and if these are freely offered we cannot doubt that, in spite of enormous obstacles, a satisfactory solution will be found. One thing is eminently satisfactory: no one has demanded a Royal commission or a committee of inquiry. Fifteen years ago a Royal commission sat on the subject, and its recommendations have not yet been carried out. We are now, let us hope, too much in earnest to adopt that familiar method of shelving an awkward problem. The facts—the horrible, disgraceful facts—of overcrowding and its attendant evils are well known, and it is felt at length that what is needed is not inquiry, but action.

Some Suggested Remedies. THE housing problem resolves itself into two parts—the removal of insanitary dwellings and the provision of sanitary ones for the population displaced. Municipal authorities have too often made the mistake of devoting attention almost exclusively to the first part of the problem, with the result that the clearing of an insanitary area has sometimes positively aggravated the overcrowding; a slum district is destroyed and the displaced populace, finding no provision made for them elsewhere, crowd into the neighbouring houses and form a new slum district. The process must be reversed; before an insanitary area is cleared, houses must be erected elsewhere for the population to be displaced. Of course it is extremely difficult, as well as extremely expensive, to find sites for building in the London area, and Lord Rosebery proposes, in order to meet this difficulty, that the London County Council should obtain powers to acquire land for artisans' dwellings outside the present area of the Council's jurisdiction. The suggestion is a good one as far as it goes, but there are thousands who could not avail themselves of a home in a rural district, however attractive it were made. They must live near their work, and their work is in the heart of the City; for such the policy of erecting, wherever possible, the so-called "model" dwellings must be continued. And for large numbers of others a cottage in an outlying district would be a white elephant, unless cheap and expeditious means of locomotion were available. The housing question is closely bound up with the locomotion question, and that again involves not only additional workmen's trains, trams, or motor cars, but also additional or enlarged termini. There must be some changes in the law before the housing problem can be effectively grappled with; for instance, that elusive personage the slum owner must be tracked out, registered, and compelled to bear a share in replacing his insanitary property by decent habitations, so that the cost of a spirited housing policy shall not press unfairly upon the ratepayers. But it should not be forgotton that much may be done by enforcing the provisions of Acts already in existence; therefore, all who hope for a satisfactory solution of this grave problem would do well to follow the advice given by Lord Rosebery and endorsed by Mr. Asquith, and elect to the local governing bodies, men whose hands are clean and who have no axe to grind in opposition to the public good. We should like also to see an experiment made in the direction of a concerted migration of manufacturers from our crowded cities into rural districts, on the lines advocated by the Garden City Association. But one thing is clear: there is no panacea for the evil of overcrowding, but there are many means by which the evil may be diminished. We must work along many lines, not talking too much of milleniums and ideals, but prosecuting vigorously any plan of action which promises even a limited alleviation of what is becoming an intolerable evil and a deepening disgrace.

Our Future Craftsmen. THERE was held last week in the Medical Examination Hall on the Thames Embankment, an exhibition which "superior persons" would have passed by with a supercilious smile, but which was in its way as important and significant as anything to be seen in the Bond Street galleries. This was the annual exhibition of work—drawings, woodwork, metalwork, &c.—done by scholars in the London Board Schools. It would be absurd to criticise these juvenilia from an artistic point of view. But the interest of the exhibition lay not in individual examples, but in the bulk of the work and the evidence it afforded of the kind of instruction that is being given in our schools. The School Board, of course, does not attempt to turn out artists or skilled craftsmen, but rather to train the hand and eye; and it is matter for legitimate satisfaction that thousands of the craftsmen of the next generation are gaining in our Board Schools some sense of form and colour, and some slight appreciation of the beautiful, and are even making tentative efforts in design. The boy who has undergone two or three years' training in drawing and in wood or metal working is likely to have a juster sense of the dignity and importance of the handicrafts than he whose schooling has consisted entirely of "book work." In place of the ignoble contempt for manual labour which causes so many of the brightest scholars to swell the over-crowded ranks of commercial clerks, his ambition will be to make beautiful and useful things, and make them well; such at any rate should be the tendency of much of the teaching now being given in our London Board Schools. School Boards are often criticised for their lavish expenditure, but if their efforts tend even in a slight degree towards a revival of handicrafts and an improvement of the standard of British workmanship, the money spent is a first-class investment, which it is the most short-sighted parsimony to begrudge.

HENRY J. TREADWELL, F.S.I.

Men Who Build.

No. 57.

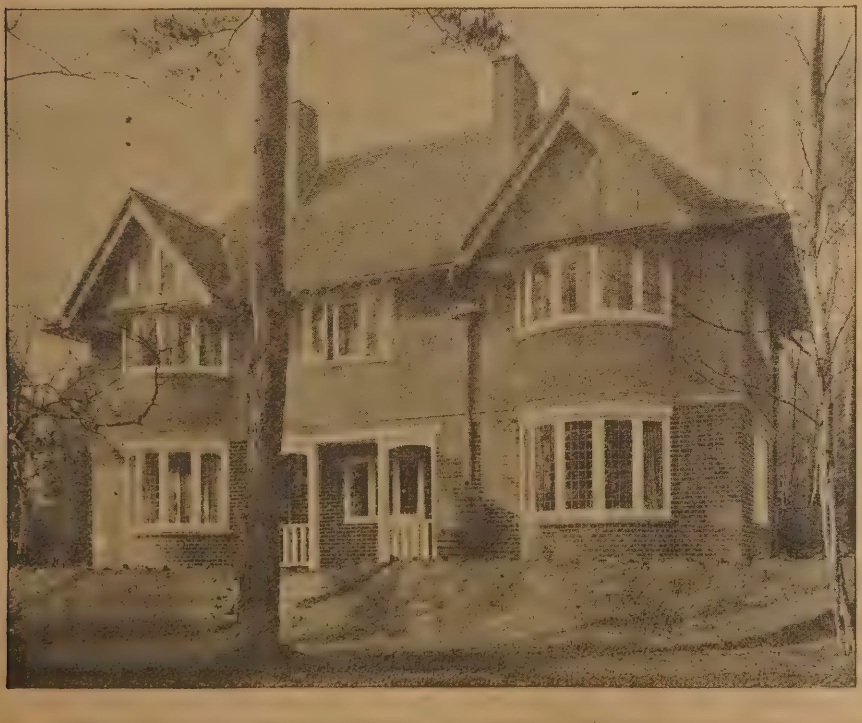
TREADWELL AND MARTIN.

As there is for objects of art no such chastening and perfecting influence as Time, so there is nothing so whimsical and problematical as the values which the apparent caprices of posterity will ascribe to the fashions and adulations of a past age. A Milton may die unknown to his country, and his name finally become a household word, and his virtu and artistry find acclamation and veneration for hundreds of years wherever culture dwells; while the name of a Thomas Haynes Bayly, who was the darling of his hour, and had the bosoms of every maid and matron swelling to the lilt of his verses, is beyond the remembrance of the generation of his own children. If we turn to architecture we may find a similar state of affairs. The castles and mansions of our mediæval nobility, the houses, mills, barns and cottages of our merchants, farmers, and peasants in the centuries gone by, which were fashioned often enough to satisfy little more than an instinct of fitness in their owners and a professional self-respect in their builders; and which rarely, if ever, enjoyed more than a passing and local celebrity at the time of their genesis, yet draw untiring crowds of American ramblers across the Atlantic every summer, and are the subject of endless poetry, speculation, exposition, and analysis. On the other hand we find the distinguished achievements of the disciples of Horace Walpole, whose efforts to revive Gothic architecture awoke the widest popular enthusiasm for architecture which this country has even seen, are now (and with great discernment and propriety as we are convinced) passed by without regard or attentiveness. The reasons for this enigma of taste and of Time are complex, and various phases are frequently brought under discussion and review. It will suffice here to say that it would seem that the essential attribute of a great school or epoch of art is that it should be always linked with the life of the people; that it should express the hopes, fears, and ambitions of a nation, or reflect truly and sympathetically the customs, etiquettes, behaviour, and social ideals of a past condition of the community; and the nearer the art approaches the nature of the art of the craftsman the more inexorable does this rule become.

This leads us to the subject of these remarks, for the work for which the well known firm of Messrs. Treadwell and Martin is particularly distinguished seems to us to be precisely that which will be recognised by our great grandchildren as the salient characteristic of the opening years of the twentieth century. We have a vague complacent sense of assurance which persuades us that the cult of conscious, trained, individualist artists in the decorative arts, represents what we may clumsily term, the art industry, of the country. But this is by no means the case. The distinctive architecture of the present epoch of English history, as it will, without question, be viewed by the archæologists of posterity, consists in the architecture of the nation, which in this democratic age of commerce and manufacture consists in long rows of villas with bay windows and clumsy imitation ornament, factory chimneys, warehouses, technical and educational school buildings, town halls, and, most conspicuously, restaurants, hotels, music halls, theatres, and public-houses. Nothing but hopeless prejudice can include church building as a conspicuous function of modern architecture, for though large sums are subscribed to the reparation and restoration of our cathedrals, money for new churches is grudgingly tendered; and though expensive stones, marbles, and metal-work, richly ornamented, are lavished upon hotels, restaurants, theatres, and public-houses, few, indeed, are the churches that are now built with any other material than brick, and few of them have so much marble as is unhesitatingly granted to the lobby of a provincial public-house. It is unnecessary to press this matter further; the real scope for modern architects, the true field where the æsthetic instincts of the nation should be emphasised, are those already enumerated, and these, it will be seen, are almost precisely those ignored by architects of repute.

LEONARD MARTIN.

The work of Messrs. Treadwell and Martin is, in one of its several phases, conspicuous for having attacked and demolished a tacitly acknowledged, though unformulated, principle of architectural practice. It is accepted by implication, that the astute, vigorous, business qualities, and facile ingenuity for overcoming the thousand obstacles incidental to the finishing of a hotel or restaurant so as to pay interest within of a few months of its erection, have altogether precluded the introduction of sound æsthetic principles into the architectural composition of the building. It has been said of the theatrical architect that he is a financial agent first, and an architect afterwards, and though this is a manifest hyperbole, it truly indicates the huge responsibility incurred, and the wide activities which are essential to success in such work as that with which the name of Messrs. Treadwell and Martin is most prominently associated. Nor does the success which the firm enjoys in its combination of profession and art altogether refute the general ideas upon the subject as above described, for responsibilities are shared between the partners in such a way that the essential business activity is identified with Mr. Treadwell, while the architectural distinction of the firm is chiefly attributable to Mr. Martin, who is thus able to complete designs without those extraneous anxieties and pre-occupations

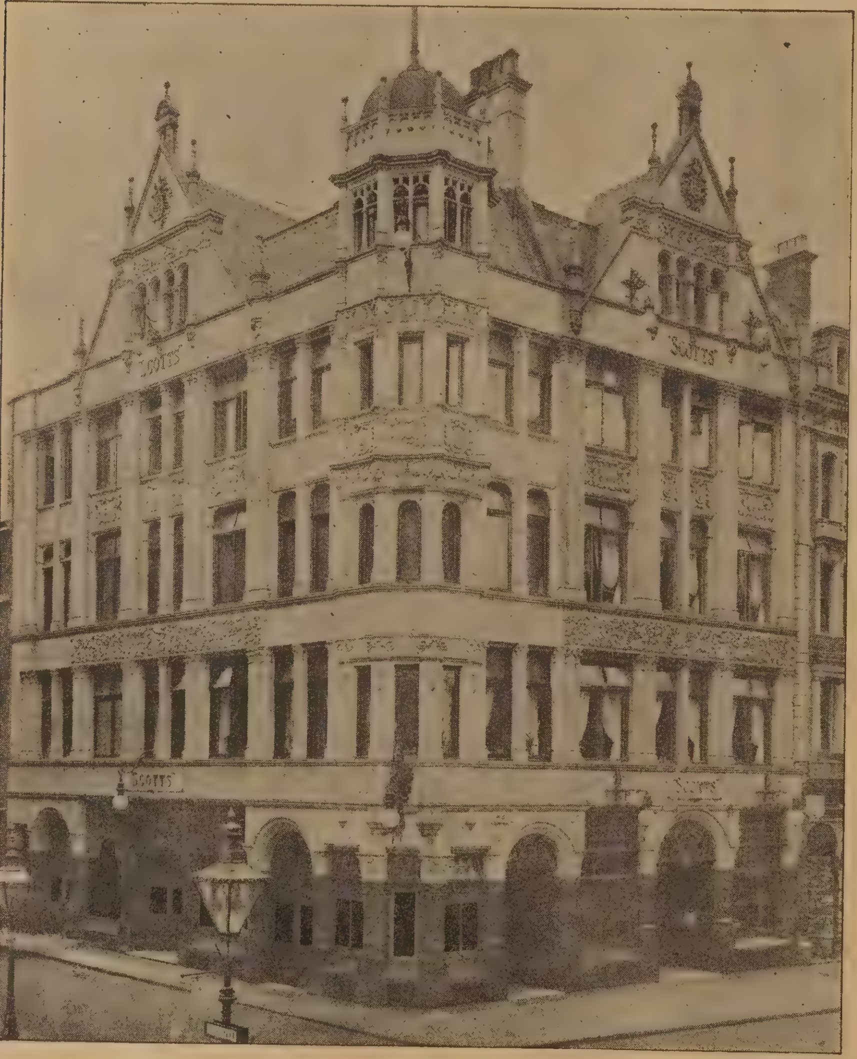


DEEPDENE, FRIMLEY GREEN, SURREY. TREADWELL AND MARTIN, ARCHITECTS.

which are so inimical to a good plan and well composed elevations.

The firm, which among other enviable distinctions has that of youth (the united ages of the partners not amounting to seventy years) has been in existence some eight years, during which period it has completed a large number of important works, as a reference to the foot of this article will show, and won one of the largest and most keenly contested public competitions of late years. A plan of this building, no other than the Southern Hospital at Carshalton, is shown in the accompanying illustrations.

Mr. Henry J. Treadwell, the senior partner, was educated at Windsor and articled to Messrs. Franklin and Andrews, surveyors. He is a fellow of the Surveyors' Institute, and during his student days won the coveted Driver prize. Mr. Leonard Martin was educated at Dulwich College, and was articled to Messrs. Giles, Gough and Trollope, architects, of Craven Street, Strand. His architectural training was supplemented by studies at the South Kensington Art Schools, and he became a student of the Royal Academy Architectural School. The practice of the firm has been considerably varied, and includes churches, private houses, breweries, stables, shops, and hospitals, besides the hotel, restaurant, and public-house designs which make up the greater part of the accompanying illustrations.



SCOTT'S RESTAURANT, TOP OF THE HAYMARKET. TREADWELL AND MARTIN, ARCHITECT.

Messrs. Treadwell and Martin, as has been already suggested, claim to be among the first to realise that public-house work need not be necessarily identified with design showing bad taste and ignorance of the true principles of composition, and they are perhaps the first, as they are certainly the most conspicuous, of those who have exemplified this conviction in their work. Work of this class throws responsibilities upon the architect which are involved in no other sphere of practice as has been said, and there are other petty annoyances and unpleasantnesses that perhaps do not so readily occur in other branches of professional work; but the architect who essays to design hotels, and in particular public-houses, is at least in this enviable position, that he is, within reason, given a free hand, and in many cases he is at liberty to use the richest and most costly materials and labour without restriction or limit. This then is the substantial privilege accorded to those who essay to practice in what is undoubtedly the most active sphere of national art at this present time, namely, that the architect is free to express the complete idea of his design without the numberless distracting limitations of cost which beset the practices of most men; and though the natural tastes of Messrs. Treadwell and Martin lie, in common with that of most architects, in the direction of the ecclesiastic and domestic styles, which, by the way, are precisely those classes of buildings in which the restrictions of cost are most notoriously prominent, the satisfaction of putting up buildings in accordance with their ideas of what they ought to be goes far towards effecting compensation for the somewhat shallow and trivial notions upon which the conception of the building must be based. Idealisation of the yearnings of the paunch and gullet, and the expression of those barbarous joys of glitter and light and appetites half-way towards satiety, must always be at a discount when compared with the idealisation of domesticity and the glorification of the sacred superstitions of our ancestors. Yet, on the other hand, the growing number and size of hotels shows that the sentiment of domesticity is not a distinguishing feature of this present age, and the capital, the activity, in short the enthusiasm, bestowed upon these establishments, and upon conveniences for eating, drinking, laughing, and making jollity, are an infallable indication that therein lies the true sphere of labour of the nineteenth-century architect. It is the natural and proper occupation of professed sightseers, of archæologists, and, of course, of the ladies, to dawdle and speculate among the relics of the past; but the activity of the artist, and above all of the artist in buildings, should lie in the present. It is his privilege—nay, his duty if he has any such obligation to his art—to decorate and idealise the life and ideals of the nation and the community of which he is a member. It is a perverseness of the Fates, surely, that the Greeks could depict Bacchanalian indulgence, at once, literally and yet beautifully, and without offence, while, should a modern architect dare to sculpture in his pediments supine beer-fuddled navvies in heaps right and left, and the waistcoat of the publican rising centrally like a moon over the horizon line of the counter, he would be ridiculed and ostracised as a professor of the art. He would be removed from the rolls of the R.I.B.A.

Of the designs reproduced in these pages little need be said. They explain themselves They cannot be readily traced to any traditional examples, but though they show an individuality which would anywhere identify them as having emanated from their designers, and from no one else, they yet bear a quality which is common to a good deal of emphatically "modern" architecture. They indicate an indirect sympathy with the traditions of the early French Renaissance, and they also, less emphatically, show traces of the inceptive spirit of design which has sprung up among us only within the last ten or fifteen years, and of which the germ was perhaps sown by Eden Nesfield. This quality is particularly noticeable in the wrought-iron signs shown in one or two of the illustrations.

The following is a list of Messrs. Treadwell and Martin's best-known works:—St. Cyprian's Church, Waltham Cross; Memorial Church of St. John, Cobham; Mission Church, Burnt Mill, Herts.; private houses at Cobham, Sanderstead, and elsewhere; Scott's Restaurant, Coventry Street, London, W.; The Leicester Restaurant; The Rising Sun, Tottenham Court Road; The Old Shades, Charing Cross; Golden Cross Hotel, Charing Cross; Norfolk Square Hotel; Bath and Cheltenham Hotel; Best and Co's Brewery, Clapham; Ashby's Brewery, Cobham; premises, 31, Maddox Street; Parochial Schools, Cobham; Southern Hospital, Carshalton.

At the Derbyshire Royal Infirmary Convalescent Home, at Holbrook, acetylene gas is used. The cost of the building has been about £6,000.

The new Church of St. Peter, Bury, is being carried out from designs by Mr. Medland Taylor, of Manchester. The church, which has been partially taken down, is modern, having been built in 1871.

The Hospital for Diseases of the Throat, Nose, and Ear in Golden Square, London, W., which was founded by the late Sir Morell Mackenzie about thirty-five years ago, has been enlarged and practically reconstructed at a cost of £10,000.

Three Towns Architects.—At the inauguration of the fourth session of the Three Towns branch of the Devon and Exeter Architectural Society, held at Plymouth on Wednesday last, the chairman, Mr. H. G. Luff, A.R.I.B.A., expressed the hope that Registration would soon become a matter of law.

The late Sir Thomas N. Deane was not (writes Mr. Thomas Drew, the cathedral architect) connected with the restoration of Christchurch Cathedral, Dublin, as stated in our obituary notice last week. This work was carried out between 1870 and 1876 at a cost of £180,000 from designs by Mr. G. E. Street, R.A.

ARCHITECTURAL ASSOCIATION.

MARBLE.

By W. BRINDLEY.

(Concluded from page 231, *No. CCXLIX.)*

WE have in Derbyshire extensive deposits of a beautiful decorative stone, that is used extensively for interior work, and which comes in cost between marble and stone. I mean the sulphate of lime, alabaster. This must not be confounded with Oriental alabaster, which is a carbonate of lime, and hard, while our English alabaster is comparatively soft, but tough and takes a good polish. For monumental work it has been used since the thirteenth century (and in the old Norman Church of Tutbury there is an arch of it), and during the Decorated and Perpendicular periods, it became the material most used for effigies and altar tombs, most of which are very beautiful; but the grandest period for its use was the English Renaissance. The important monuments erected in this style are artistic productions with an individuality of which we have reason to be proud. Just look at the examples in Westminster Abbey; their delicate and bold mouldings in contrast, the alabaster with a dull polish, only sufficient to show the colour; their inscription slabs and columns of black marble, the whole effect heightened and brought together by a judicious use of colour and gold; further to perfect their colour scheme, they sometimes diapered their black shafts with delicate surface work. Their inscriptions were cut with a flat ground, not V-shaped; the result is they are readable at any angle. In regard to the modern finish and polish of alabaster my conviction is that in intricate and delicately moulded work, with carvings and sculpture, glass polish is a mistake. And as alabaster is used instead of marble on account of cheapness, if we leave out the polish we further reduce the cost. Nothing looks worse than some parts polished and others not. Sooner than polish carvings, do as the mediæval men did, gild them. In Rouen Cathedral is a splendid monument of the time of Francis I., executed in English alabaster. In the north of Spain, near Bourgos, we find grand monuments, made in a delicately yellow-tinted alabaster nearly as hard as marble. The old workings would appear to be lost; I have spent much time in trying to find them, without success, although I found an inferior variety something similar. Alabaster is an excellent material for lining the walls of hospitals, as it is non-absorbent, and is not affected by acids. It contains about 50 per cent. of water, and is so hydrated that it will not absorb any more liquid, but if heated to over 200 degs. Fahr. it parts with its water, and turns to plaster of Paris, so it is not suitable for chimneypiece work next the fire. Most of the imitation marbles that periodically appear are baked alabaster, which will then absorb any fluid colour you like to apply. The Italian statuettes we see so much are often only white translucent alabaster of Voltera, which is boiled, producing an effect similar to statuary marble.

Granites.

A very important industry that has made immense progress in the last thirty years is that of granite work. The Scotch of Aberdeen are entitled to the credit of this revival, which may be accounted for by the superior quality of their granites, their greys, reds, and rose colours being excellent. The amount of work they do in monumental work alone is enormous; immense quantities of this class of work go to America. The last few years has made us acquainted with the beautiful granites and labradorites of Norway and Sweden. These the Aberdeen workers import in rough block. It is only of late years that granite could be sawn economically. This is now done by the aid of chilled iron shot, or crushed steel, which are American inventions; and lately they have given us another still harder material—carborundum. This is next to the diamond in hardness, but it appears to lack toughness, as it soon crushes up into mud. There has been used within the last few years, in our street buildings, a large amount of polished granite work, and when it is broadly detailed and kept to one tone of colour, it looks well. But I do not think we should like to see Waterloo Bridge and the Embankment polished, and certainly polished cemetery work generally looks very hard and uninteresting, while all monuments designed on Celtic lines are ruined whenever polished. Further, nothing can be worse than trying to get effect by cutting off the polish to produce a pattern. Of all decorative architectural stones ever discovered, none has yet been found to surpass the Imperial Egyptian porphyry of the Romans; its purple colour is unique, and this colour it will retain for ages unimpaired; it is rich, but not gaudy, and is one of the chief colour glories of the churches of Rome. What would Henry III's tomb look like if the porphyry slabs were removed? Porphyry columns are the chief glory of St. Sophia in Constantinople. The old quarries of Mons Porphrities are only about twenty miles off the entrance to the Gulf of Suez. There is an inexhaustable quantity of the choicest material remaining, and through the Suez Canal it can now be got to Europe at a very reasonable cost, and with improved methods of working might be available to us for structural decoration, the same as it was with the Romans. The only thing wanted to achieve this is twenty-five miles of tramway; there is a regular gradient of one in eight all the way to the sea, and only brake-power is wanted to regulate the rate.

Museums.

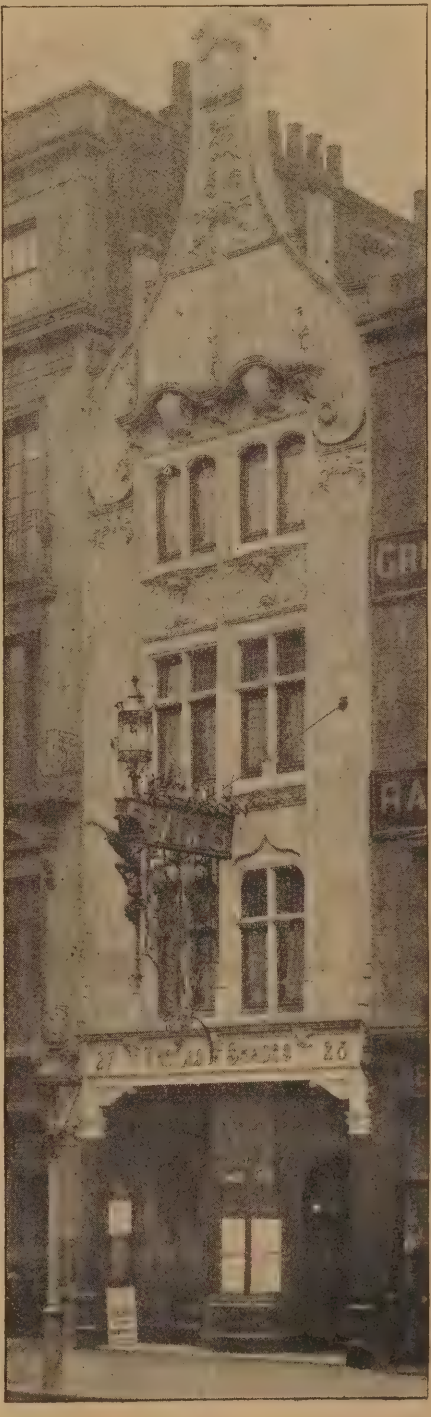
A very complete collection of the marbles of the United Kingdom will be found in the Museum of Practical Geology, and also in the Natural History Museum. Foreign as well as British specimens are fairly collated. Then again, in the British and South Kensington Museums many interesting pedestals and works of art in coloured marble may be seen, also good examples of Roman pavements. In the University Museum of Oxford is the famous "Corsi" collection, consisting of 1,000 specimens; these, I am delighted to say, have now fallen into the keeping of Professor Miles, who has had them placed in a good light; many at present are in drawers, but he will be pleased to show them to anybody interested. There are two similar collections to the "Corsi," made by Signor Belli; one is in Brussels, the other at the University Museum in Rome. The Museums of Edinburgh and Dublin have each a fine collection, chiefly British.

Polish on Marbles.

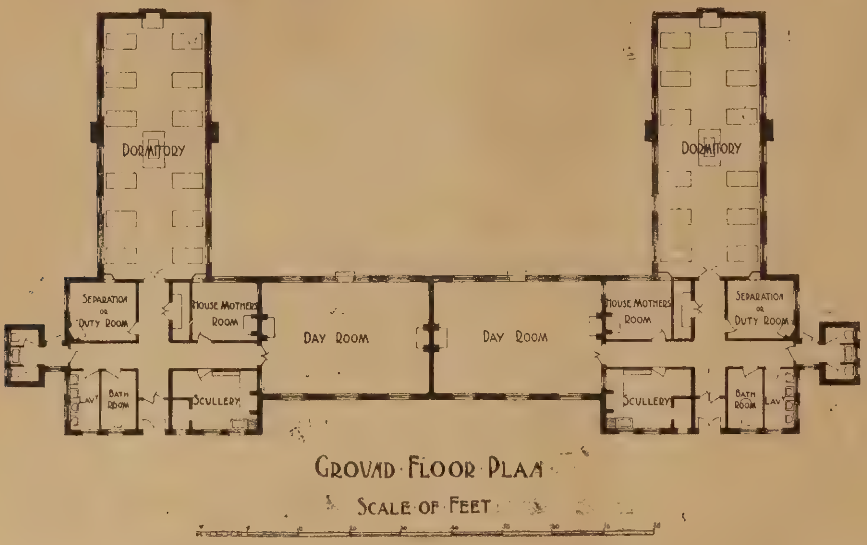
Labour with the classic Greeks was of little consideration, as they certainly finished their works regardless of cost, but their white marbles in Architecture they never polished (except the joints where it could not be seen), everything was left from the tool. There were no bright shining surfaces to reflect and injure the form. Polish you do not see anywhere on the Acropolis of Athens, and in the hundreds of beautifully sculptured "stela" of the museums of Athens, London, Paris, and Berlin you find nothing but tool finish. For London and English towns, with our smoke and dust, we may require a finished surface that dust will not cling to, but I do not think bright polish helps us very much, for we all know how dirt will even cling to the surface of glass. Coloured marbles, to bring out their beauty, have to be polished, but even in these, glass polish has sometimes a garish look.

Marble Pavements.

The pavements of the Egyptians and Classic Greeks were close-jointed thick slab blocks. Later the Greeks produced a few examples of tesselated mosaic. But the most important pavement period was undoubtedly



"THE OLD SHADES," CHARING CROSS, W.C. TREADWELL AND MARTIN, ARCHITECTS.

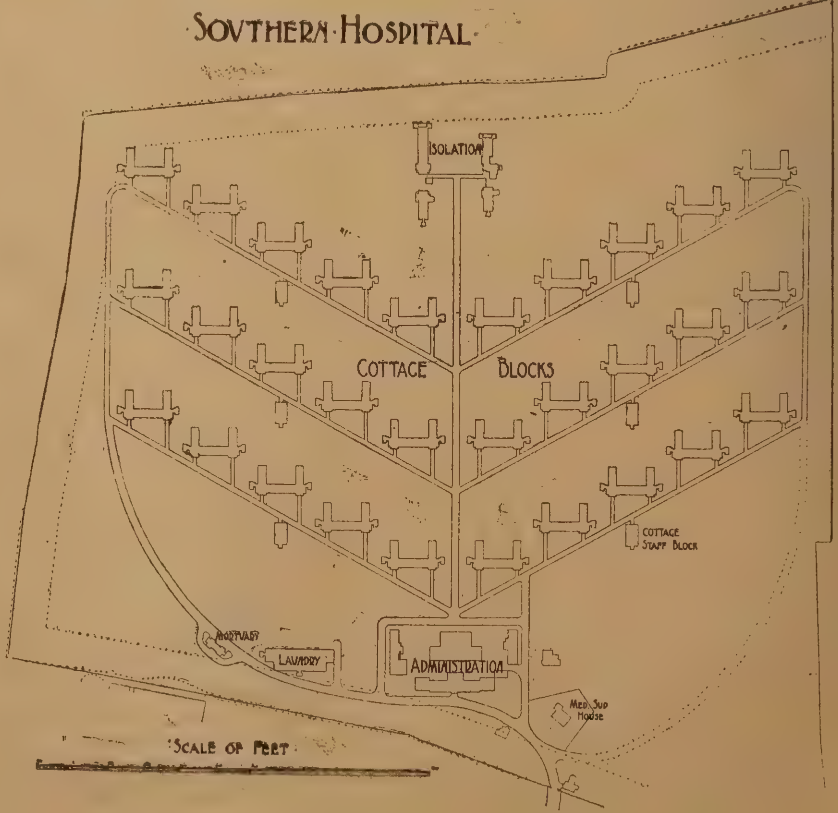


SOUTHERN HOSPITAL, CARSHALTON: DOUBLE COTTAGE BLOCK. TREADWELL AND MARTIN, ARCHITECTS.

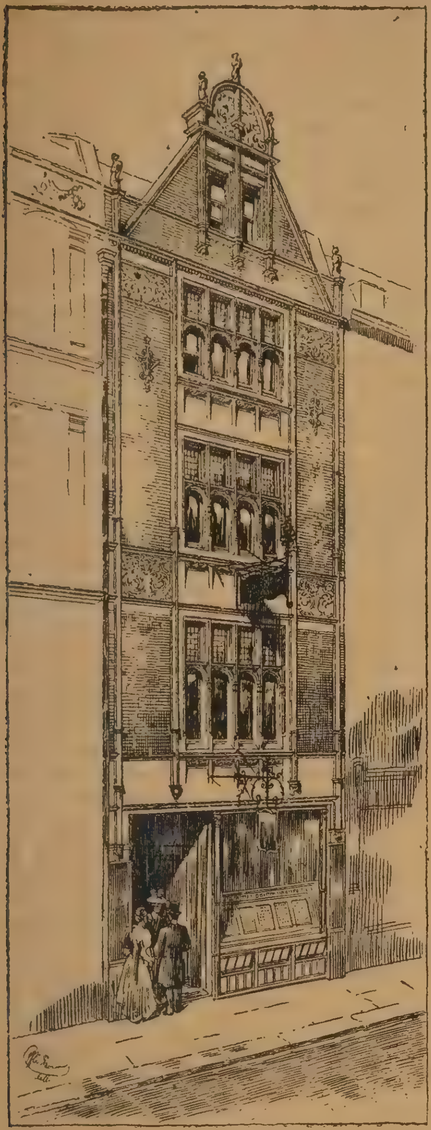
that of the Romans, which, in the beginning of the empire, was a continuance of Greek designs and methods, most likely executed by Greek artists and workmen. The universal system soon became throughout Rome and her extensive colonies, that of tesselated mosaic, which they executed in such a way that has never been done since. Just call to mind the infinite variety of design seen in these pavements; many are figure subjects, heads, and every description of animated life, from fish of all sorts, swimming in the waters, shell fish, and nets on the beach, animals of all types in quick motion and passant, grouped and posed naturally and artistically, in a way that few artists even now can equal. In addition to all this animated drawing, tree foliage was treated freely, growing, full of life, but adapted in the ablest of design to its purpose; plants of all sorts were grouped, and conventionalized, to fit their position. Leaves and flowers arranged as circling wreaths, others as borders, straight and curved, of fret and guilloche, interlacing round circles and angular forms, with the greatest of ease and freedom. All we now know and can do by the aid of reference help, the Romans knew in the third century A.D. They also knew how to execute durable work by having a good, proper foundation, and using tesseræ three times as deep as ours, making that much firmer key. How little we know about the artists and art workers of these Roman tesseræ pavements. It would appear that with every Roman legion there must have been a corps of sappers and miners, as they practically found everything in the way of useful rock and mineral veins, which they worked on scientific methods. They, further, must have had a sort of artists' corps, consisting of art designers and workers, or these art pavements never could have been produced. We may ask what became of the art in this and other colonies when the Roman occupation ceased? It would appear to have departed with them, as the pavements which had been universal now became obsolete. The art never went quite out in Italy, as the Popes were always caring for old pavements in way of removing and repairing, and at Venice the enamel mosaics of Murano kept the art alive. The modern revival we have to thank the French for, in the building of their Opera House, and the importation of Venetian workmen to carry out their designs. From France the art came here, and soon spread throughout Europe and America. For these pavements a good concrete foundation is absolutely necessary, and it ought to have time to draw out. The method of sticking the tesseræ on a paper cartoon, which is turned over and rolled or beaten into the coating of lime plaster, and afterwards rubbed down with soft grits, is familiar to all. When large slabs of colour are introduced to get contrast, it is necessary to insert a dummy slab of common stone while the beating of the tesseræ is being done. The dummy slab is then broken up to get it out; this does not disturb the bedded tesseræ. Wood will not do, as it swells with the wet. The Romans sometimes used tesseræ of 1in. covering large areas with one colour only, in red or green porphyry or Giallo Antico. The effect is very imposing when enhanced with a flowing border of great width, as seen in the Baths of Carracalla. These 1in. tessera of marble in black and white in a variety of patterns are used for the street pavements and public squares of Lisbon, and answer well, as it is very hilly. Where the Roman patterns have been enlarged, however, they are most trying, almost making one dizzy to walk over them.

Sectile.

The sectile or slab pavement, arranged in different patterns of marble and porphyry, is very effective. There are examples in Rome on the Palatine, the Basilica of Julia, and the Pantheon. I think the simplest are the best. These are large slabs of rich marble, opened out with only a border slab of another colour round, such as large slabs of Pavonazetto opened out with simple borders of yellow statuary. Also Pavonazetto slabs, with St. Ambrozio Verona for border is a success. Carystian Cippollino so treated, with Verde Antico bands, makes a rich but retiring pavement. Pavements of marble squares, black and white, have been used in England since the sixteenth century, if not earlier; they are bright and clean, very durable, and not costly; red and white is also good, but I prefer the black not polished, which is a soft grey black; these now have in a great measure superseded encaustic tiles. The Opus Alexandrinum pavements which abound in Rome (there is also an example of which we have in Westminster Abbey) are geometrical patterns made with porphyrys and marbles, the grand effect being produced by the "values" obtained by large circular slabs in contrast with delicate pattern work. The large circles are section slabs of Egyptian porphyry columns, the smaller circles are usually green Porphyry of Laconia. This is because you can get large slabs of Egyptian porphyry but not of Laconia. The grand pavement under the centre dome of St. Mark's, Venice, which consists of twelve Carystian slabs making a square 30ft. by 26ft. with a rich mosaic border all round—you will all remember the Ruskin Street controversy as to its irregularity—is now levelled and done up; and not this alone, but most of the pavements in the church and nearly all the grand ones which are the glory of Rome have been all made "bran new" in the last few years. Another sort of pavement, very effective, are the Florentine ones of the Baptistery and San Miniato; they are foliage and figure pattern inlays of black-green Verde de Prato into white. The subject is always the white slab. The same treatment is applied to the wonderful pavement of Siena Cathedral. In designing marble pavements as few colours as possible should be used, and the work put on a good foundation. The Italians and French during and since the Renaissance period have used marbles and porphyrys in various ways for furniture and objects of vertu. Many of the Florentine and Milanese tables are real works of art and



BLOCK PLAN OF SOUTHERN HOSPITAL, CARSHALTON. TREADWELL AND MARTIN, ARCHITECTS.



31, MADDOX STREET, W. TREADWELL AND MARTIN, ARCHITECTS.

costly productions. They further introduced marble plaques into ebony cabinets, which are still sought after by collectors. The various French works in marble and ormolu, especially of the Empire period, are generally refined and good. Much of this class of work made by the Chinese and Japanese is good and suggestive.

Monuments.

From the time of the Early Egyptians down to the present the best materials obtainable have been employed for memorials to the dead. With the Egyptians no stone was too hard or too difficult to work. The Greeks chiefly used marble, and all who have had the pleasure of studying their monuments in the museum of Athens cannot help being impressed with their simplicity and beauty. Each one tells its own tale at a glance, without attempting to decipher the short inscription. Architecturally there is a great variety. The "Stelæ" have mostly a flat pediment, to throw off the rain, with simple mouldings; the profile sections are flattened on the face; the sides invariably taper; the simpler have a relief panel of two or three figures, showing the farewell shaking of hands, with often the faithful dog looking on; nothing can be more pathetic. The more important have sculptured figures in high relief, often two-thirds life size. The sculpture comes boldly in front of the side pilasters. The whole thing gives the idea of the design and execution being by the same artist. I do not think they are "Art and Craft" productions. We are much indebted to Dr. Murray, of the British Museum, for bringing out of the basement and dark stores an interesting collection of these monuments. He has placed them in a good light, in a separate room, at the end of the Parthenon Gallery. South Kensington has some good casts, which might, for educational purposes, be added to. The Greek sarcophagi were always refined, and are well worth study. The museums have usually obtained those that are richly detailed and filled with sculpture, but simple moulded ones, like the one at Gergenti, I think show better the Greeks' skill in subtlety of detail. The Romans at the first worked on Greek lines, but later got into a bold and unrefined type of work, especially in their sarcophagi and altar form of monument. But, like the Greeks, their small sarcophagi, and urns for funeral ashes, are of great variety, beautiful in form, and, as marble work, exquisitely wrought. The British and Soane Museums contain excellent collections. The Byzantines made sarcophagi of enormous dimensions in porphyry and Verde Antico. They were large enough to take the deceased in full robes; the designs were simple in detail to suit the coloured material. The Verona tombs of the Scaligers of later date are much on the same Etruscan lines.

Christian Monuments.

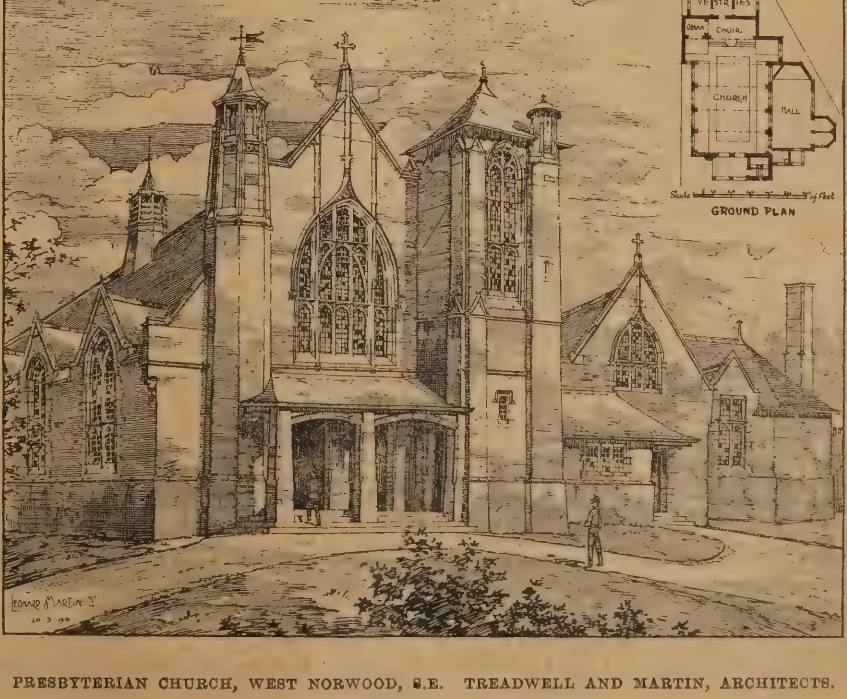
How interesting most of the cathedrals and old churches of this country and the Continent are, owing to the Christian monuments they contain! Many of these buildings are real museums, the monuments giving the history, national, parochial and architectural. Unfortunately, owing to church restoration, we have lost many, while others have been skied where they cannot be seen. The want in many of our cold-looking church interiors is colour. This could be very much helped by coloured marble monuments. How cold most of the white monuments in St. Paul's Cathedral look, many of which are very costly, but how little they add in way of colour! Contrast the sculptured ones with the Parthenon sculptures that we now know had colour pattern on them, or the beautiful works of Donatella and others in Italy, where gold and delicate colour are freely used. But we need not go abroad for colour precedent, when all our grand monuments in Westminster Abbey, from Henry III. down to James I., are full of colour. For modern work in sculpture, Rosso Antico, Giallo Antico, and Black produce good work, especially for reliefs. The Romans and Florentines have left us numerous examples in most coloured marbles. There ought to be an effort made to get back memorials into our churches, for it is sad to know that a person who has been a constant worshipper in a church, who has taken interest in parish affairs, and done good in various ways, should at his decease have no simple record placed to his memory in his church. He is buried in some distant cemetery amongst thousands of others who have piled over them masses of marble or granite void of merit in design. The friends of the deceased feel bound to erect what they call an imposing monument or it will never be noticed. Now, would it not be better, instead of placing a costly pile in the cemetery (where it is frequently not seen until the next interment), to erect over the grave a simple record in durable material and place on the church walls a small but artistic monument—I say small, because the church walls can only hold a certain number? If the memorial is to a man entitled to arms, then give him his arms and a short inscription; or it may be a small panel of sculpture, portrait, or anything appropriate with colour. By this means we enrich the church and record the deceased; but little can be done until the clergy can fully appreciate its importance; and if they give permission—not, say, to the artist—it must be in this style or that to suit the church or match some poor one already there.

Jointing.

Masonry jointing for built work is the proper method, but when marble has to be applied to iron construction, as in the covering of stanchions and girders, special methods have to be adopted, the things to guard against being expansion and vibration. In wall surfacing with marble slabs, vertical angle joints, with a mitre quarter of an inch square check, answer very well; and in strongly-marked marble mouldings going round a tablet, or even small opening, the ordinary picture frame mitre is the best for effect. In the fixing of slab work it is best to leave a small open space at the back, and use bronze clamps with a projecting notch to prevent the slabs being knocked inwards. In the jointing of chimney-piece work heat expansion and contraction in some cases has to be provided for. I find when a piece of marble 1ft. in length is heated up to 230 deg. Fahr. it expands about one-thirtieth of an inch; at 300 deg. Fahr. one-sixteenth; and up to red heat one-eight; but in each case on cooling it only contracts half of the expansion.

Chimney-pieces.

For skill in chimney-piece construction we must go back to early Monastic times. Then builders found out that a long lintel in one stone could not resist breaking when over their large wood fires. To obviate this they jointed their "heads," using some form or other of wavy or stepped joint. And when



PRESBYTERIAN CHURCH, WEST NORWOOD, S.E. TREADWELL AND MARTIN, ARCHITECTS.

marble is similarly exposed to a great heat this is the only safe method of jointing. North Italy, in the provinces embracing the cities of Genoa, Florence, Venice, and Milan, was the country for early chimney-pieces, dating from 1400 to 1600. Venice, owing to its local building material, being Istrian or Verona marbles, "was always a marble-working city;" in addition to these they brought from Greece, along with their coloured columns, blocks of white. Istrian stone or marble, which is hard, and receives the most delicate chisellings, was the favourite material. The designs, which are Renaissance, mostly consisted of rectangular projecting canopies, with architrave, frieze and cornice supported by corbels well built into the wall, under which are pilasters or ornamental columns with caps and bases. Most of the chimney-pieces are beautiful in design and well executed. The "antique-mongers" of Florence and Venice have grabbed them whenever they had a chance, and they copy and make "new old" ones to the fullest extent by staining and smoking over wood-shaving fires until it will almost defy any expert to say if they are new or old. So I advise you when buying these chimney-pieces to purchase them on their merit and not as antiquities; then you are safe. Belgium, which is a marble country, has produced many good canopied chimney-pieces. The most famous is the grand one in black marble at Bruges. France is perhaps the richest country for good chimney-pieces in every style and date; they are found in every old palace, château, and castle; there is a series of simple ones in the rooms of the Louvre in Paris, one in Egyptian porphyry, another in lapis lazuli, another in Rosso Antico, and so on. These have ormolu mouldings. The refined Adam's ones take a lot of beating, either in design, execution, or economy of good material. The original drawings of many of these are in the Soane Museum. A bold "ovolo" moulding in coloured marble all round the fireplace opening is always safe. In conclusion, I will say, in designing use as few colours as possible in your work, and the nearer you keep to one the better.

THE DISCUSSION.

Dr. A. S. Murray, in proposing a vote of thanks to Mr. Brindley, thought there was one little contentious matter in the paper, and that was in regard to the colour of the Parthenon. A year or two ago a young American student examined the architrave of the Parthenon very carefully and also examined the sculpture in the British Museum, and he came to the conclusion that both had been covered with a thin translucent size or coating of crushed marble, which had the effect of taking the roughness off the marble, and also enabled the decorators when painting on the patterns along the architrave to paint with great rapidity and beauty. The only way he (the speaker) could reconcile these theories with Mr. Brindley's was that the size had been made from marble having iron in its composition.

Mr. Bolton, in seconding the vote of thanks, considered the most satisfactory manner in which to treat marble pavements was in geometric designs.

Mr. Fellowes-Prynne could not agree with Mr. Brindley as to the need of keeping to one colour throughout in the decoration of churches; it was the glorious diversity of colour in Saint Mark's at Venice which made it so sublime.

The vote of thanks was then passed with acclamation, and in reply Mr. Brindley said he quite agreed with Dr. Murray and the American student that the Parthenon sculptures had been coloured. In reply to a question by Mr. Andrew Oliver, he said the only ancient tools used in working the stone that had been found were Roman ones of steel. He was afraid there were not many marbles which would retain their colour in the open air; Irish green, verde antico, and magnesian reds and purples did. Green magnesian marble was not destroyed by the atmosphere of London, and it did not much harm the magnesian stones. He did not wish to be understood to say that one colour should be used, but only that they should keep as near to one colour as they could. Young men liked to use as many colours as they could, which resulted in a loss of breadth. Marble could never be got to go together on the ordinary pigment colour scale on account of the great variation in each piece, and they could not be tried in small pieces.

Correspondence.

LEPER WINDOWS.

To the Editor of THE BUILDERS' JOURNAL.

WALTHAMSTOW.

SIR,—From the note in a recent issue of your journal it would appear that Mr. St. John Hope has originated the Sanctus bell theory for the use of these much debated features in our English churches, but reference to the pages of "The Antiquary" will show that it was propounded and successfully substantiated by Mr. C. E. Ponting, F.S.A., a well-known authority on architectural archæology, in a series of letters (illustrated by drawings of typical low side windows), which appeared in that publication some ten years ago. But is not Mr. St. John Hope in error in saying that the bell could be rung *outside?* Many of the low side windows I have seen were provided with iron grilles, which would effectually prevent this, and in one case which I call to mind (Lyford, Berks) the opening is only 7½in. wide, and at the back of a deep splay, which would have the same effect.—Yours truly, H. M.

"GARDEN CITY:" MR. HOWARD'S REPLY.

GARDEN CITY ASSOCIATION,
11, NEW COURT, CAREY STREET, W.C.

SIR,—Permit me to write a few lines in reply to the letter of Mr. Strange in your last issue. The ground plan of "Garden City" as projected by me in "To-morrow," is really only suggestive; in some situations (as on the sea-coast) it would be quite unsuitable, in others quite impracticable. But it supplies, I think, a useful basis for discussion; and surely a careful consideration of the chief ends to be secured in wise city building is much needed. The opinions of architects are, therefore, of great value, and it is a hopeful sign when the president of the R.I.B.A. draws attention to the necessity of concerted yet individual design in street architecture (see p. 224 of your last issue). Mr. Strange is evidently possessed with the same idea, which you had forseen would certainly commend itself to the whole profession.

With Mr. Strange's letter before me it is with some hesitation that I confess that curved street lines have often appeared to me very beautiful. And those who are responsible for the widening of our main London thoroughfares seem to share the same feeling. For I observe that in connection with the new street from Holborn to the Strand it is proposed to strike a bold curve from east to west. That some inconvenience may be experienced in the case of crescents of a short radius may be quite true, especially if the houses are not detached; but Mr. Strange will, on reflection, probably admit that this difficulty entirely disappears when the circle, of which the curve is an arc, is a large one.

Again, it seems to me that "endless smoke, dirt, and smell" are by no means necessarily associated with factories and workshops. It is, indeed, extremely probable that in "Garden City," where everything would be up-to-date, and to which, therefore, public attention must be largely drawn, manufacturers would see it to be to their interest to erect beautiful airy buildings and to introduce (where furnaces were necessary) the most approved smoke-consuming apparatus. Indeed, the community would demand this, and that in its position of ground landlord. Mr. Strange's description of a beleagured garden city, as he sees it, would do justice to the most imaginative of our war artists; but, having disposed of the smoke—loud noise is not customary even now—its factories and workshops, far from being objects of reproach, might be extremely interesting—all the more so because Beauty and Utility would go hand in hand. Emerson asks a more pertinent question, and gives the the true reply:—"Is not the selfish and even cruel aspect which belongs to our great mechanical works—to mills, railways, and machinery—the effect of the mercenary impulses which these works obey? When science is learned in love and its powers are wielded by love, they will appear the supplements and continuations of the material creation."

The advantages which arise from placing the factories, &c., in the outer ring appear to me to be enormous. (1) In whichever direction the wind blows, the smoke from one half of the circle would pass right away from the town; and the more objectionable, or least unobjectionable factories, might be so placed that the prevailing wind would have that effect. (2) All the materials for manufacture, the products of manufacture, and the waste from manufacture could be dealt with without passing through the town. (3) All the factories &c., can be connected by railway, and thus the advantages of concentration secured without its usually attendant disadvantages. I do not think Mr. Strange has realised the perfect quiet which might pervade the residential parts of a city if all its main industries were thus carried on in the outskirts, or how near the people may be to their work and to their recreative spaces, while yet in close contact with the large outside world.

Mr. Strange is, I think, in error when he says that the expansion of a town must necessarily be from the centre outwards. This is certainly usual, but as certainly is not necessary; it is mainly the result of individualistic town-building, and is attended with the gravest inconveniences. The nucleus of a town is generally its places of manufacture, and these should certainly not be in central positions, when all the evils which Mr. Strange has spoken of in connection with them must pervade the whole town. A better, because a healthier, mode of growth, I believe, would be in concentric rings or arcs—the factories forming the outer ring, the homes of the people next, the parks and chief public buildings central—the whole surrounded by an agricultural domain, which should not be to any considerable extent encroached upon, further growth taking place by leaping over the surrounding agricultural estate—as explained by me in your issue of October 25th. (This method of growth is analogous to that known in zoology as gemmation, as "when a foraminifer, consisting of a little sphere of sarcode, develops a second one like the first, then a third one like the second, till quite a little group of these little globes has been formed, after which the whole are surrounded by a complex shell"—Nicholson.)

I confess I cannot share Mr. Strange's view that "in order that each house may get its maximum of sunlight, the streets should run as far as convenient in the direction of north and south." To push this idea far would involve, it seems to me, a long, narrow city—length without breadth. Nor is it at all necessary. I have seen very pretty effects produced by houses built with their fronts at right angles with the street, and in a city of ample space every home might, I fancy, be flooded with all attainable sunlight, irrespective of the direction in which the street ran, by a suitable but harmonious departure from street line.

It would greatly assist criticism, and lead to good constructive results, if Mr. Strange or other correspondents would do as I have done—draw a ground plan of a city which might be built on any fairly level stretch of ground; for the essential principles which should determine the relative positions of factories, shops, railways, houses, schools, &c., ought, I think, to be capable of clear statement, and thus the infinite variety which we all love to see in architecture, as in every other art, may be gathered up into a beautiful and noble harmony.—Yours faithfully,

EBENEZER HOWARD.

R.I.B.A.

EXCAVATIONS IN CYPRUS IN 1896.

BY A. S. MURRAY, F.S.A.

THE second meeting of the session of the Royal Institute of British Architects was held on Monday evening, when the president, Mr. William Emerson, occupied the chair. After the minutes of the last meeting had been confirmed, Mr. Alexander Graham rose to express the regret of the Institute at the deaths of Sir Thomas N. Deane, of Dublin, and Mr. T. J. Flockton, of Sheffield. Among the many designs of the former was that for the library and museum at Oxford, which, besides being good architecture, was one of those great works that came under the influence of Ruskin's teaching. In conjunction with Mr. Woodward, Sir Thomas had competed for the Law Courts, and was also one of the competitors for the Imperial Institute. With regard to Mr. Flockton, he was the embodiment of Sheffield, for he had built half the city.

Dr. A. S. Murray, F.S.A., then gave his paper on "Excavations in Cyprus in 1896." The district where these have been carried out is best known to classical students from the extensive ruins of the Græco-Roman city of Salamis which lie along the seashore. It had been thought that the lower strata contained remains of a much older settlement, which would confirm the tradition that a band of Greeks returning from the war of Troy, under their leader Teucer, had settled there and built a city, naming it after their native island of Salamis. But no such remains were found. More inland, however, were several underground tombs, of construction peculiar to the Mycenæan age—such remains as might be expected of the original Greek colonists. As the settlers would have kept to the coast, the present inland situation of the remains was explained by the fact that an extensive tract of marshy land through which the river Pediæos flows, had once been a fine bay, at the head of which, on a rocky slope, the Greek Colony was established. Between this slope and the river, when Dr. Murray's party arrived, was a stretch of tilled fields worked by the people of a neighbouring village. On the face of the fields there was no sign whatever of ancient civilisation.

An Accidental Discovery.

An accident led to important discoveries. An ox in ploughing put its foot into a hole. At night the ploughman returned to the spot and found underneath a fine tomb of the Mycenæan period. The secret leaking out, Dr. Murray, who was just then starting for Cyprus, decided on further investigation, which resulted in the discovery of about 100 tombs, all of the Mycenæan age. This they claimed to be the burning ground of the original Greek settlers. Traces existed of previous rifling of the tombs in Roman and Mediæval days. Notwithstanding this, the objects in gold discovered almost equalled in quantity those obtained by Dr. Schliemann at Mycenæ, and were fully as important in quality, while the ivory carvings were of far greater value than his, and the pottery was more abundant and of greater interest. The author dated them at about 800 B.C., or even a century earlier. Numerous objects were found which had been imported directly from Egypt, others from Phœnicia exhibiting the mixture of Egyptian and Assyrian art for which the Phœnicians were famous, and others in which a purely Hellenic spirit was recognised, sometimes acting upon and modifying Oriental conceptions, at other times introducing entirely new conceptions as well as new technical resources. In the author's view this new

Hellenic Element

had reached Cyprus from the adjacent coast of Asia Minor, whence came the earliest Greek poetry, the earliest philosophy, the earliest painting. One of two reliefs on an ivory mirror handle represented a man slaying a gryphon—a familiar subject in Phœnician works, particularly among the antiquities found by Layard at Nineveh, dating about 800 B.C. The conception was obviously Assyrian in its origin, but there was also a breadth and style in the gryphon, and a keen sense of the creature's suffering which was finer in observation than anything known in Assyrian or Egyptian art. The other relief was a lion attacking a bull—again a frequent conception in Phœnician art. But in no case was the conception worked out in the ingenious manner here displayed. The artistic power and the just observation of animal life exhibited in these reliefs were premonitory of Greek genius. An ivory casket was another example. Its lid was divided into squares for the game of draughts on the same principle as an Egyptian draught-board; but the art of the reliefs on the sides was not Egyptian. It corresponded to what is known as Hittite art, the remains of which are found in Northern Asia and in Asia Minor. The prevailing element of the subject depicted was Assyrian, but on to that was engrafted a certain rude observation of actual men and animals, unlike anything Assyrian. The dawn of a true Greek artistic spirit was also exhibited in some porcelain drinking vessels. One or two were prototypes of similar Greek vases of the sixth century B.C. Among

The Bronzes Found

were a pair of finely-made greaves. As bronze greaves were not known in Homer's time, these antiquities were consequently later than the Homeric poems. A curious cubical bronze stand showing on each of its four sides the heads of two women looking out of a window seemed to be characteristically Palestinian, and might be taken as an illustration of the bronze stands or vases which Hiram made for King Solomon. On one part of the site were found bronze utensils, shovels, tongs, field implements, the pans of a balance, and some bronze vases which had been crushed together as if ready for melting. A heavy ingot of bronze, such as was exported for melting purposes, pointed to these being the remains of a foundry. In one tomb were examples of pottery belonging apparently to the most primitive age, side by side with the most developed stage of Mycenæan industry. These older shapes, the author concluded, had survived for the common purposes of daily life. The gold ornaments discovered consisted mostly of thin fillets or diadems on which designs were beaten out from moulds, the same mould being repeated over and over again on the same fillet. An Egyptian pectoral, inlaid with paste, of orange, blue, and white colour, and some

Gold Fibulæ

or perona, used by Greek women for fastening their dress on the shoulders, afforded additional evidence in support of the date the author assigned to the antiquities. A number of Egyptian scarabs were found, including one bearing the name of the Queen of Amenophis III. (c. 1450 B.C.), and another of the much later Orsokon dynasty of Egyptian kings, dating from the ninth dynasty. Discussing the presence of these two scarabs in a set of tombs which, from their general contents, could not have covered a period of much more than a century, the author contended that they could not both be contemporary with the kings whose names they bore. It was a matter of history that Amenophis III. became a Greek hero under the name of Memnon, and scarabs bearing his name were reproduced in comparatively late times for export among the Greeks. Turning to the decorative patterns painted on vases and beaten upon gold, these were interesting as carrying us back to the origins of

Industrial Art in Greece.

Nothing was more striking than to find representations of animal forms of the most extraordinary naturalism side by side with the most primitive exhibitions of decorative skill. There were illustrations of the cuttlefish, a favourite subject on pottery of the Mycenæan kind. To this day the cuttlefish is an article of food among the poorer people of Greece, and doubtless it was so in primitive times. Hence its being copied for decorative purposes. As, however, there was more of pattern than of naturalism in the form depicted, it was reasonable to suppose that a previous familiarity with spiral patterns evolved in technical processes had formed a basis of positive knowledge, from which those early designers advanced towards the more speculative copying from nature. Discussing the spiral pattern on the gold ornaments and pottery, the author showed the difference in the treatment of this pattern on the oldest, Dipylon, pottery of Athens, and that on the Mycenæan specimens. Spiral patterns from among the many sculptured stones of Scotland were shown as evidence of the community of artistic instinct between the people of the Mycenæan age and the Celts of Europe—a point now becoming generally recognised, but which the author had been well abused for suggesting at the time of Dr. Schliemann's discovery. As far as the excavations showed, the goldsmith seemed more at home in plant life than the vase-painter. The rosette and the palmette were equally common. In one instance there was a double palmette of striking resemblance to a pattern hitherto supposed characteristic of Greek vases of the sixth century B C. In another instance there was a complication of palmettes and spirals, almost suggesting a Corinthian capital. There were constant suggestions of the Ionic capital, but no sign of the Doric. There was an excellent example of a guilloche pattern incised on an ivory vase. From the curious and almost bizarre blending of art revealed by the relics, the author inferred that the whole series belonged to a period when the eastern Mediterranean was the scene of constant struggles for supremacy on sea among rival Greek or semi-Greek peoples. The results of the excavations, Dr. Murray added, will shortly be published by the British Museum in a book upon which he has been a good deal engaged since 1896.

THE DISCUSSION.

Mr. J. L. Myres congratulated Dr. Murray on the most important discoveries he had made in Cyprus, which, he pointed out, well filled the gap existing between the period of Mycenæan civilisation and that of the earliest stages of Hellenic civilisation. Dr. Murray had mentioned a number of features which indicated that the Mycenæan artists in Cyprus had already passed under the influence of Egyptian art. That is to say we were dealing at Enkomi with a somewhat late prolongation of the Mycenæan Age in the Levant. The great value of the Enkomi excavations was that they had produced a mass of first-class material for the study of that transitional art.

Professor Elsey Smith described the tombs he had seen at Paphos as being sunk in the earth, not of masonry, though some had doors composed of slabs of stone, and were approached by a flight of steps. After a few remarks by Mr. Hugh Stannus, Mr. Beresford Pite, and the chairman, a vote of thanks to the lecturer was carried unanimously. Dr. Murray briefly replied, and the meeting then terminated.

London County Council.—The proposal to construct a new tunnel under the Thames, to connect the districts of Rotherhithe and Shadwell (which would cost £2,500,000), was the chief matter discussed at the meeting of the Council held on November 14th. Eventually it was decided to go on with the work. The General Purposes Committee recommended that no action should be taken with the view to purchase No. 17, Fleet Street, commonly known as Wolsey's Palace, but an amendment to refer back was carried. The proposal to construct, in connection with the great Westminster scheme, a double line of tramways in Millbank Street, on the underground system of electric traction, was not carried, owing to the majority in favour of it being insufficient.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

BY G. A. T. MIDDLETON AND R. W. CARDEN, ASSOCIATES R.I.B.A.

(Continued from page 196, No. CCXLVII.)

VII.—CONTRACTS.

1.—*Describe shortly the documents usually prepared for, and used in, a building contract.*

The documents included under a building contract consist of (*a*) drawings, general and detail, (*b*) specification, (*c*) general conditions, (*d*) contract form, and sometimes bill of quantities.

(*a*) The drawings are usually (1) a block plan, to a small scale, in order to show the position of the buildings, boundary walls, &c., upon the site; (2) elevations of all sides, plans of each floor (with roof and foundation plans in the best work) and two or more sections, these all drawn to a scale of 8ft. to 1in., and fully figured so that the contractor may have no opportunity for making mistakes; (3) detail drawings to a scale of 2ft. to 1in. with mouldings, &c., full size, so that the contractor may know exactly what he has undertaken to do. In practice it is unusual for *all* the details to be got out by the time of signing the contract; in this case a ½in. detail of part of the main front and of the roof, &c., would be prepared and included among the contract drawings.

(*b*) The specification may be considered as a report upon the drawings, with a description as to the method in which the building is to be erected and of what materials it is to consist. It is obvious that many things—for instance, "four coats of oil colour" and similar details—could not be in any way represented upon ⅛in. scale drawings, and these must perforce be embodied in the specification. The drawings and specification must agree in every way, and as much of the work as possible should be described in both classes of documents. It is still more important that what is omitted on the drawings should be found in the specification, and *vice versâ*. In the specification will be found:—The class and manufacture of bricks, lime, &c., for brickwork, with method of mixing mortars and concrete; laying of bricks, forming of arches, &c., and similar minute instructions for all trades.

(*c*) The general conditions should also agree in every particular with the drawings and specification. They include instructions with regard to:—Execution (to be according to drawings, &c.); commencement and completion; setting out and corrections; quality of materials and workmanship; variations, delays, maintenance; rate of payment; insurance; arbitration, and costs thereof, &c.

(*d*) The contract form is a legal agreement on the part of the contractor to execute the works in question, in accordance with *a*, *b*, and *c*, within a specified time and for a specified sum of money, known as the "consideration," which the employer agrees to pay. This form must be signed by both parties before witnesses, and stamped with a 6d. agreement stamp within fourteen days of its execution.

(*e*) The bill of quantities consists of a detailed statement of the amount of each material required for the erection of the building—as, for instance, "thirty-seven rods of reduced stock brickwork in mortar (as previously described) in footings, walls, &c.," or "200ft. cube fir framed in roof." The bill is prepared as a guide for the contractor on which he may base his estimate.

2.—(i.) *A certain amount of drainage works are included in some building operations which you are superintending as architect. You have been careful enough to insert a clause in the conditions to the effect that no trench is to be filled in by the contractor until the section of pipe in it has been tested. In spite of this precaution you find that at one of your periodical visits a certain section has been filled in before test, and without your orders. Discuss the case shortly: (a) from the legal point of view; (b) from the point of view of expediency.*

(ii.) *Rightly or wrongly, you do not insist upon the trench being reopened, but when the question of certificate for this portion of the work arises the contractor claims for 110 cubic yards of excavation, return fill and ram, &c. Would you certify for this amount? Length of drain between manholes, 60yds. Surface levels above ordnance datum at manholes respectively 150ft. and 151ft. 6in. Invert levels above ordnance datum at manholes respectively 144ft. and 145ft. 6in. Diameter pipe 6in. Pipes laid on P.C. concrete equal three times diameter in width. The trench is the normal width at the surface. (Note.—Calculations should be given.)*

(*ia.*) From the legal point of view the contractor has violated his contract in closing the trench, and the architect would be acting well within his rights—indeed, it would be his duty—to order the trench to be reopened in order that the drain might be examined and properly tested. Should the contractor refuse to open the trench, and neglect to do so within a given time after due notice has been served, the architect is at liberty to employ some other firm to open it, the cost to be borne by the contractor or deducted by the architect from the certificate.

(*ib.*) Under the head of expediency the question may be viewed in many lights. It may be a case in which the work must necessarily be pushed forward with the greatest urgency, and then the reopening, inspection, and closing of a trench would involve the loss of much valuable time. Under these circumstances there are a fresh set of conditions to be considered. The work may be of such a nature that it could be tested for alignment and fall by flashing with lamps from manhole to manhole; though, of course, the jointing and bedding of the pipes would not, by this means, be proved to be satisfactorily carried out. If, under these circumstances, the architect deemed it imprudent to have the trenches opened on the chance of the contractor having scamped his work, and when the whole work is ready to be tested, the water test should be applied in a very thorough manner, with as great a head of water as possible, and allowed to stand for twice the usual time. Should the drains not withstand the test, it would be imperative to have the suspected section opened up—provided, always, that the leakage was not obviously accounted for by some other defective point in the work. In another case the decision of the architect as to whether the trench shall or shall not be opened might depend entirely upon the known character of the contractor; for supposing the builder to be a man who has been employed for many years by the architect—let him be a man who, say, for twenty years, has carried out thousands of pounds' worth of work with the most immaculate rectitude—then it would seem that the architect has strong justification in allowing the work to pass as being correct, except that it is exceedingly improbable that a contractor of such integrity would commit a breach of contract, and fill in the trench before inspection, so that this case need hardly be considered.

Moral influence has also a bearing on the subject. If the contractor be disposed towards scamping his work, and if he begins to exhibit symptoms of rascality in the early stages of carrying out a contract by an act of such a description as that under discussion, and if the architect does not cause the trench to be opened, and thereby condones the offence, a precedent is established for the contractor, and the moral power of the architect becomes considerably lessened. Whereas if, on the other hand, the architect firmly takes up his stand by the contract and has the trench re-opened *nolens volens*, the contractor will speedily conclude that honest methods are the only ones to be employed in his dealings with *this* architect at all events. The next point of view to be considered merges into the second part of the question: that inasmuch as the architect has not viewed the trench he cannot be certain that the amount of excavation taken in the quantities has been duly performed. The amount claimed seems to be large, the excavation being 180ft. long, 6ft. 6in. deep (adding 6in. for the concrete), and 2ft. 6in. wide at the surface, and 1ft. 6in. at bottom, average 2ft. wide = 2340 cube feet, or 86⅔ yards "excavate and part return fill and ram." Now, if the architect has passed the trench without having it reopened, it may be taken for granted that he assumes the whole work to have been properly carried out, and therefore it follows that the contractor has a right to be paid for this amount, of 86⅔ yards, while there is no evidence, actual or presumptive, to warrant his claim for 110 yards.

3. *Shortly after you have succeeded to the business of another architect, a builder's account comes in for certificate for a work that is proceeding on a measurement contract. You check this account from your predecessor's measurement books, which appear to be duly initialled by the clerk of works and by the contractor's agent, as required by the conditions of contract, but you cannot make the quantities as regards some of the underground work, as claimed by the contractor, agree with the quantities as per measurement books. You make an appointment with the builder to talk the matter over, at which he promptly repudiates his agent's initials, on the ground that the person who initialled the books was not appointed by him for that purpose. Discuss the case shortly. (a) What would you do if you subsequently find among your predecessor's papers a letter from the builder appointing the man in question as his agent for the purpose of taking measurements in respect of the work in question? (b) What would you do if you cannot find such a letter?*

The solution of this difficulty is simple; for, even if the contractor denies having appointed the man who initialled the book, he clearly was bound by his contract to have appointed somebody to do so, and the neglect of this is to his own detriment. We should accordingly assume our predecessor's measurements to be in every way correct and should certify only for the amount they set forth. Every means should, of course, be taken to prove that the man was the contractor's agent, and if the man could be communicated with it would be a simple matter to ask him to produce any documentary evidence he may have. Failing proof of this kind, and if the difference between the measurements of the works to be paid for involves a large sum, it might be possible for an arrangement to be made with the contractor to the effect that the work should be opened up and measured again by agents of both parties to the contract, the party proved to be wrong bearing the cost of extra excavation and filling in to same. In case (*a*) there would be absolutely no doubt whatever as to the correctness of the books, and we should certify accordingly. The discussion of case (*b*) will be found above.

4. *Shortly after a client of yours has accepted, on your advice, the tender of a certain builder, you discover that both the builder and the client are rascals. (a) Explain, shortly, your general line of conduct towards each of them; (b) State, shortly, what precautions you would take for your own protection as regards your dealings with them.*

This question (which was voluntary) is scarcely answerable, so much depending upon events and circumstances as they arise. One can only suggest that the architect should rigidly hold the balance between the contractor-rascal on the one side and the building-owner-rascal on the other; that he should keep strict watch over the builder, and carefully supervise all materials and workmanship, give and receive all orders for extras, variations, &c., in writing, having them stamped even if considered necessary, and generally observe the utmost caution in dealing with both of the rogues.

THE GOTHIC REVIVAL.

By HALSEY RICARDO.

A LECTURE with this title, the third of a series in connection with the Arts and Crafts Exhibition Society, was delivered by Mr. Halsey Ricardo at the New Gallery, Regent Street, W., on Thursday evening last. He began by saying that in the history of building the idea of harking back, for reproduction, to some past time first occurred at the end of the fifteenth century, till then there had been no actual break in the process of growth. Unlike as mediæval work was to that of classic times, it followed the same principles, for it was entirely the outcome of natural conditions. The Romans in their need for aqueducts, baths, &c., invented new types of buildings, each specially adapted to its uses, and the same occurred during the twelfth, thirteenth, and fourteenth centuries in unbroken descent. It was true that there was a break in the architecture of the fourteenth century, due to the visitation of the Black Death, but the general line of growth was the same. The introduction of classic traditions under the revival of learning had at first but little noticeable effect on the old traditions, but its nature was not that of a growth or a graft, but parasitical.

Till then art was made for the people and shared by them, and all classes of men put hands to their work; those who had not the skill to execute or carve the actual work quarried or hauled the blocks of stone or did what manual labour they were fitted for, and though the cathedral was substantially the work of the Masons' Guild, all co-operated in the task of erecting the building, every affectation and self-consciousness being excluded.

The Renaissance was not popular; it was not universal art, it was not any man's art, but was the product of individuals. A band of amateurs and antiquaries formulated the definitions of "correct" art. The reins were now slackening in the hands of the Guilds, and while the craftsmen were learning the new language and the new technique the world lost interest in traditions it could not understand. The study of such philosophers as Plato and Aristotle showed that the Pagans were not ignorant, and their forms of art obtained sway with the educated classes, but for the people classic art had no gospel. Though the art was adopted by Popes and cardinals, when inquiring into the lives of these patrons it would be difficult to discover a more irreligious set of men. This art, while claiming so much polish, in opposition to the savage Gothic, was inhuman and unreal, and was the cloak for foul lust. To the people it became an inexplicable quantity, which only those who were rich enough could ever hope to enjoy. The Guilds of building and craftsmanship generally were taken over *en bloc* as a going concern, but under a new management. At first the masters were not consistent in their ideals, but under the guidance of the sculptor-architects progress was still made.

This new movement did not at once overwhelm the activity of the Guilds, but it checked them sorely; it was not for them now to make new discoveries, but to do as they were told. The responsibility of the action lay no longer with them, but with their directors. Gradually their vitality failed. For a time the fund of collected tradition of ages remained, and such architects as Inigo Jones and Sir Christopher Wren had it to draw from. The knowledge which contact with materials gives to the designer gradually faded away, and the designer became more and more an amateur.

In the attempt to get "pure" styles reproductions of original examples were made; these attempts to make a Palladian palace serve all purposes was an impossible task and the marvel was that so much in the shape of success was obtained. Still, there were places in the country where the old traditions have remained in the building of houses and cottages to the present day. The great outburst of church building, due to the Great Fire and Queen Anne's Bounty, produced buildings typical of the age, showing the great chasm that yawned between the populace and the nobility, and since the time of Wren, and his followers, the lamp of architecture has burnt more and more dimly.

But during the last years of the eighteenth century the people awoke from their apathy to the desire for more freedom, expressing itself in the reform of Parliament, the abolition of the slave trade, and other measures. The rights of man and the sympathy of man for man dated from this period. The laying of roads and making of canals in the country, and the use of steam increased the prosperity of the nation in the main, but the lot of the poor grew harder and harder and bread became dearer. The times were so out of joint that to many it seemed there was a risk of all existing institutions being done away with, and men looked to past ages to find a simpler and healthier state of things, and religious feeling spread far and wide. Enthusiasm now sprang up, and the outlook on life was changed.

In architecture Gothic was, at first, taken up as a sentimental fashion. A deeper feeling soon arose. The work of Welby Pugin is preserved because of its passionate sincerity and vitality. The fashion of the day, due to romantic literature affecting emotional but shallow natures, however, is shown in works, for instance, by Sir Jeffery Wyattville. The Classic Renaissance had recalled the work of past ages with some amount of success, and it was thought that there was no reason why architects should not have a greater success with Gothic. Gothic, however, was a living art based on the needs and conditions of the times; it was the outcome of truth, and was couched in a form which all could understand and enjoy.

At the time when Gothic was in development, Europe was aflame with religious zeal. The work of that time showed that the executants enjoyed doing it. The worker knew how to do honour to his design; you must appeal to a man's heart, to bid him use his dexterity as a means, not an end. The work is replete with human passions which we have all felt. The rich were not so far removed from the poor; and within the church portals all class distinctions between men were hushed. It was sincere, but its sincerity was rigid and could not adapt itself to the changes which were coming. The Reformation was at hand, and found England acquiescent. Cathedrals began to be raised by lay-builders, and not by church workmen. For a time things went on without disclosing much difference outwardly; the Guilds represented a wide and great fund to draw from, and it has taken three centuries to exhaust it. But the Gothic Renaissance found no fund of tradition as the early Renaissance had done; like a cone spinning on its apex, it had no stability. The attempt to clothe the present age with the garment of a past age was a revolution like that of an inverted cone, and nothing but the quick alterations of successive fashions could keep the cone balanced. To make up for the absence of tradition many books and specimens were taken from all countries, and the old buildings were restored or trimmed down to suit the ideas of the form most in vogue at the time. The fashion of building in the Gothic style took to such an extent that when the Houses of Parliament had to be rebuilt it was felt, nationally, that they should be built in this style. Buildings were erected as closely to known examples as the architects' employers would permit their needs to be squared into the requirements of a past age, Pugin arose, the most capable, learned, and sincere man of his time, but he was forced to rely wholly upon himself to get his work executed. He got his own workmen, and for a time there was a dream of tradition to help him, but even with this help the life in his work burnt dimly, and he had to live in the past. He had to persuade his employers that, besides Gothic being a national style, it was cheaper; and what man could do he did, but the task was superhuman. The power of his influence lay in his passion; the substance of what he had to say woke up men's minds. A great burst of church building sprang up, and with it a great burst of church restoration. The history of the building was disregarded, and conjectural attempts were made to show it as it stood originally. Whilst, therefore, new churches were being erected in the Gothic style, their models were being destroyed. The Revival swept away much that might have been preserved, and put in its place a forgery. This destruction roused opposition from the first from thoughtful archæologists, such as Carter and Emmett. Mr. J. T. Emmett had started work as a Gothic architect, but gave it up as impossible to gain its ideal. From independent sources, however, a voice loud and clear arose, and it rang with such burning eloquence that those who were its enemies could scarcely shut their ears close enough to escape its message. It based itself on high authority, and spoke as one who knew, as one who had the cause of Right only to advocate, as one from whom all personal element was eliminated. England has never been the same since that voice arose, and men were drawn in by its influence. Mr. Ricardo here read an extract from Ruskin's letter to Sir Henry Acland, written on January 20th, 1859, with reference to the Oxford Museum, which was to be an ideal building and the hope of architecture. In this letter Ruskin pointed out clearly that it was not right to suppose that after lying dead for two centuries the system of Gothic building could be successfully revived at a first trial, nor to suppose that present-day workmen could be quickly produced on a level with those who inherited the instinct of their craft through many generations. A return to quieter and simple art, said the lecturer, was indeed necessary if we were to found an architecture of our own—which we *must*, for building must ever go on. To-day the architect rushed over continents with his sketch book, and returned from his travels with fresh troubles for the workmen.

In looking at the work of G. E. Street, the lectures could not help thinking that his pen was somewhat his enemy. He had built grand houses, and, though dwelling for the most part—unconsciously in fairyland, his work showed a desire to be actual and commonsense; but his capable hand could not supply all that was asked of it, and in its impetuous production carried its owner beyond the land of actuality into fiction. William Burges also dwelt in fairyland—he wrote "Ivanhoe" and "The Talisman" in stone—his work was full of fun and reflected the happy side of life; of the deeper passions of humanity his work shows little trace.

The only other man named by the lecturer was Mr. Butterfield, to whom he ascribed qualities that would make his work endure. His attitude was frank loyalty to fact; he had studied as widely as Pugin, and with a patience far deeper; no haste mars his work. When he built a church he did not build it for a past age, but studied modern requirements. He was always sincere, and this sincerity separates his works from those of other men. In all that he did, one is conscious of a reserve power, which some erroneously call austerity. In much of his work, though the effect is supreme, the means would seem strangely inadequate. Life is not a trifling matter, and only those who assert it on these terms can expect to get anything good out of it. Butterfield had a message to deliver, and his buildings show this message; but he accepted no help from the craftsman, and it is his individuality alone which preserves his work.

Art, whether good or bad, is man's language to his brother man. It may be real or sham, and it is our business to reject the sham. This is not always a simple matter to determine, but sincerity is a quality hard to assume. The whole of past architecture is open for us to study and as an example. The Gothic Revival for the most part was an attempt to study it from the top downwards and not from the bottom upwards.

At the Church of Chalfont St. Giles, Bucks, a costly set of oak choir stalls have been provided, seated angels being placed at the ends instead of "poppy-heads." Milton's cottage is at Chalfont St. Giles.

Bricks and Mortar.

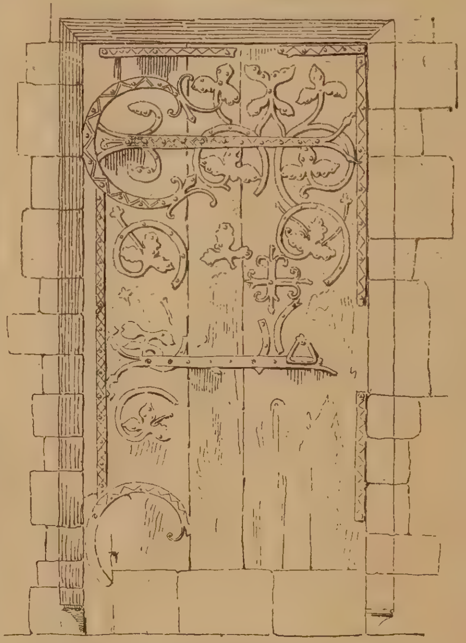
Aphorism for the Week.

> *"In the older days of Art*
> *Builders wrought with greatest care*
> *Each minute and unseen part;*
> *For the Gods are everywhere."*
>
> —Longfellow.

Our Centre Plates. The house at Beckenham for Mr. R. Murray Hyslop has recently been completed on the Kelsey Manor Estate by Messrs. H. Copeland and Son, contractors, Beckenham, Kent. The stonework was executed by Messrs. Champ, of Penge; the heating by Messrs. Killick and Cochran, of Liverpool; the iron casements by Messrs. Pearse, of Kennington Lane; the enriched ceilings by the Veronese Co., Norfolk Street, Strand; the electric wiring by Messrs. Clarke, of Sloane Street; the mosaic floors by Messrs. B. Ward, of Westminster; the lavatories, etc., by Messrs. Jennings, of Lambeth; the grates by Messrs. Bratt Colbran, of Mortimer Street, W.; the leaded glazing by Messrs. Plarse and Messrs. Simpson, of St. Martin's Lane. The grounds were laid out under the direction of Mr. H. E. Milner, of Westminster. Mr. Beney's house at Beckenham is also on the Kelsey Manor Estate. The view is taken from the north-east corner. The general contractors are Messrs. H. Copeland and Son, by whom the work is being carefully carried out. The stone work is being done by Messrs. Champ, of Penge; the heating and hot water engineering by Messrs. Killick and Cochran, of Liverpool; the electric wiring by Messrs. Peacock, of Clerkenwell, E.C.; the coal and luggage lift by Messrs. Smith and Stevens; the iron casements by Messrs. Crittall, of Braintree; and the laying out of the ground is in the hands of Mr. H. E. Milner, of Westminster. The architect of both houses is Mr. Francis Hooper, F.R.I.B.A., of Norfolk Street, Strand, W.C.

A Famous London Square. Kensington Square is a place of great associations. The names of Pope, Addison, Macaulay, and Thackeray are connected with what was perhaps the first-built house there—the old Greyhound; but this is now replaced with a building of red and yellow brick, with stone dressings. At the corner opposite, says a writer in the "Daily Telegraph," is the house in which Thackeray, in "Esmond," lodged Lord Castlewood, and in which he made the Pretender hide; it was in the cottage belonging to the house (now No. 16, Young Street) that the great writer produced that immortal work, "Vanity Fair." At another house in the square Talleyrand resided in his exile, while the late Nassau Senior, the famous political economist, came to live at No. 32 early in the century. One of his neighbours was James Mill (the father of John Stuart Mill), while close at hand lived John Richard Green, the historian. The names of the Duchesse de Mazarine and the Earl of Shrewsbury are also connected with Kensington Square. The Duchess was one of Charles the Second's favourites, who bestowed on her a pension of £6,000 a year. Kensington was right out in the country at the end of the seventeenth century, when William III. bought Nottingham House and transformed it into Kensington Palace. For many people there is a nameless and indefinable charm about the domestic architecture of this period. The unpretentious character of the design, the unobtrusive decoration, severe and simple, the varying sky-line, the trim little forecourts, with wrought iron gates opposite, chastely moulded doorways, the effectiveness of the warm red-brick dressings gleaming out of the mass of brown stock, crowned by a roof of red tiles or green-tinted slates; all combine to produce an effect of well-ordered comfort and homelike simplicity that is not found to the same degree in any other order of domestic architecture. Those who remember Kensington Square before the improver began his handiwork, will remember it as a place that seemed to be pre-eminently the home of quiet respectability and leisurely independence.

Eastwood Church, Essex. Eastwood Church, near Rochford, is an interesting little village church, and was restored in a judicious manner a few years ago by Mr. William White, F.S.A. The illustration on this page, showing the ironwork on a door on the north side of the church, is taken from a measured drawing by Mr. John Hebb, F.R.I.B.A. The ironwork appears to be of two different dates. Mr. J. Starkie Gardner, in his useful little manual on "Ironwork from the Earliest Times to the Eve of the Mediæval Period," one of the South Kensington Museum Art Handbooks published by the Committee of Council on Education, gives an illustration of the ironwork on a door on the south side of this church (p. 54). In referring to these two doors, Mr. Starkie Gardner remarks:—"In one we have crescent hinges without a central strap, ending in scrolls, and diapered in the manner of the earliest examples, faced by corresponding detached crescents, with fish-shaped straps between them. These and other straps, as well as the binding to the door, are frilled with scrolls as at Willingale (Spain, near Ongar). The second door [that figured in our illustration] is similar, but the binding has no frilling. As in the case of Leicester and St. Albans, there are fourteenth century additions to the latter, this time in the form of a scroll design with vine leaves cut out of sheet iron and nailed to the door. The crescent hinges with detached straps on the door in the north aisle of Canterbury Cathedral are very similar in fashion to those at Eastwood, and were probably utilised from an older doorway." The hinge of the door on the south side of Eastwood Church has an inscription in Gothic characters which is now nearly obliterated; the inscription is in Wright's "Essex," II., 600, where the following description of Eastwood parish occurs:—"This parish is said to be named from its situation eastward from the woods and parks of Rayleigh and Thundersley. In Edward the Confessor's time the manor belonged to the father of Suene, Earl of Essex, to the latter of whom it was granted by the Conqueror at the time of the survey. It is in length nearly four miles and in breadth one; the village is distant from Rochford two, and from London forty miles. . . . . On one of the door-hinges of the neat little church in this village there is the following inscription in very curious old characters:—'Pax regat intrantes, eadem regat egridientes.'"



EASTWOOD CHURCH, ESSEX: SOUTH PORCH.
DRAWN BY JOHN HEBB, F.R.I.B.A.

Street Lighting. The results of an inquiry made by the proprietors of "The Municipal Journal" into the Welsbach incandescent system for street lighting, come, they say, as a surprise, and the most surprising thing they found was that municipalities with their own electricity works were adopting the newer gas system for the lighting of their streets. From a pamphlet, which bears the rather exaggerated title, "Revolution in Public Lighting," and contains a reprint of articles that have appeared in "The Municipal Journal," we take a few extracts:—"The old drawback to incandescent lighting for public thoroughfares, which arose from the effect of wind and vibration on the mantles, has been overcome. Improvements have been made with the mantle of such a nature that, given a proper lantern, all trouble ceases. The lamps can be made to stand the test of the wind of a sea storm, as they do at Ramsgate, or the vibration of traffic in crowded streets, as they do at Liverpool. One thing seems to be clearly established by our inquiry, and that is that incandescent lighting is of very little use in the old lanterns." Despite the pages of tables comparing the experience of corporate towns with incandescent and ordinary gas lamps, and despite the eulogy of the Welsbach system, we do not think that this will be the "conquering competitor" of the electric light, for though the latter generally proves to be the dearer system it is free from many faults common to all forms of lighting by gas, and offers more possibilities for producing an ideal light—especially for streets.

The Helen Faucit Memorial. The inhabitants of Stratford-on-Avon who were present at last week's meeting at the Town Hall exhibited a strange lack of appreciation of a generous offer. Sir Theodore Martin, K.C.B., has offered to present to the parish church a new pulpit in memory of his late wife (Helen Faucit), an addition which is to cost £1,000. As there seemed to be a great difference of opinion as to the best and most suitable position for the pulpit, this meeting was held to consider the question and inform Sir Theodore of the wishes of the people on the subject. Sir Arthur Hodgson said that for a mere matter of 14ft.—the distance between the two suggested sites—the offer had been half rejected, and, after some discussion, he suggested that the site of the pulpit should be left entirely to the donor and to the architect (Mr. Bodley). The people would, however, have none of this, and unanimously voted for their own plans. To say the least, this was hardly courteous.

Arts and Crafts. Every movement has its adherents and its opponents, its zealous advocates and its sincere, captious, or cynical critics, and the Arts and Crafts movement is no exception to the general rule. The "Daily Chronicle" has recently been expressing its opinions on the subject, and says that, though the exhibition is an interesting one, carefully arranged by a body of earnest men who evidently have their subject very much at heart, it very much doubts that the exhibition has any real influence on national art. The writer deplores that, since the introduction of machinery, the work of to-day is devoid of that sign-manual which the old workers put on their productions, and that it has no spontaneous feeling of the people. "Therefore," he says, "it is nonsense for the critics of arts and crafts exhibitions to talk as though the movements such exhibitions represent in concrete form were going to effect a revival that can only be effected through a change of economic conditions. . . . . Each Arts and Crafts Exhibition makes the fact more clear that the English revival of artistic handicraft exists only among the *précieux*, and that their taste is administered to not by the industrial classes, but by dilettanti." With so many contending voices around him, where is the workman to find a basis? If one side affirms this view as the correct one, and this ideal as the true one, and the other side denies them, it makes it indeed hard for the honest, intelligent worker to decide which is the right path to take; and it must be remembered that it is in him that the revivalists centre their hope in attempting to elevate the craftsman and his craft.

FULHAM PUBLIC BATHS COMPETITION.

THE drawings submitted in this competition were on view to the public at the Town Hall, Fulham, during last week. They consist of some twenty-nine designs shown upon upwards of eighty drawings. The site for the baths and washhouses is at Melmoth Place, Walham Green, and its area is about 51,978 square feet, being a narrow strip of land between Melmoth Place and Hartismere Road, the former being the more important thoroughfare. The sides of the site are bounded by buildings and back gardens, a private road entrance only being retained from Hartismere Road. It will thus be seen that the competition was one in which the architectural treatment of the exterior was confined to the Melmoth Place frontage, and as in many designs, including the first premiated, this frontage is given up (with the exception of a narrow width retained for entrances) for commercial purposes of shops, the competition becomes one of planning pure and simple. Many of the competitors have recognised this commercial aspect of the scheme; others, unfortunately with good plans in many instances, have stultified themselves by bringing the baths to the Melmoth Place frontage, the treatment of which they have included in the scheme.

In the first premiated design by Mr. H. Dighton Pearson, A.R.I B.A., 8, Arvin's Road, Teddington, space is left at either side of the entrances from Melmoth Place for shops, the centre block containing superintendent's office, pay box and refreshment room with entrances for either sex, on the first floor the board room, &c., and superintendent's house on the floors over. The author covers the entire site on the ground floor with the exception above mentioned, the entrances to the various apartments are well arranged, and the men's corridors to the first and second-class swimming baths are separately entered from the hall.

The ladies' swimming bath is placed behind their slipper baths nearest Melmoth Place, the men's first-class swimming and slipper baths adjoin and are entered by a separate corridor from the hall, whilst the men's second class swimming and slipper baths are entered from a separate corridor along the left-hand boundary of the site. A gallery runs round the first-class swimming bath and is entered from the corridor, with an exit at the opposite end into the second-class corridor. Club and performer's rooms are placed between the two men's swimming baths. The laundries are well placed. The establishment laundry is entered at the end of the second-class men's corridor and communicates with the public ironing room by a pass door. The public laundry is entered from Hartismere Road; the plan of this department is particularly well worked out in respect of convenient practical working. The whole of the building is top lighted with the exception of the sanitary accommodation, which is arranged round lighting areas. In the basement is placed the boiler house, with coals in a good position, and subways for service pipes to swimming and slipper baths.

The second premiated design is by Mr. Henry Drury, Craigleith, Kersfield Road, Putney Hill. Unlike the selected design, the author has provided a lighting area along the right hand side of site; separate entrances are provided for men and women from Melmoth Place. The corridors, however, are not so direct, a single corridor giving access to men's first and second-class swimming baths. The staircase to the gallery which surrounds the first-class bath is entered from this corridor. The public washhouse is placed at the Hartismere Road end of the site; the establishment laundry, however, is located in the basement and does not appear very accessible for soiled linen. The board room, as in the first selected design, is placed on the first floor, over the ticket office, which, however, is not quite so well arranged, and the author has omitted to give any communication for the staff between the public baths and washhouses on the ground floor. The elevation is treated with a gable and bay window to board room, but the second-class women's slipper baths coming to the front leave a gap in the street elevation which is commercially extravagant. The drawings are neat and carefully prepared.

The third premiated design, shown on four strainers, numbers 47 to 50, are by Mr. T. W. Aldwinckle, 1, Victoria Street, Westminster. The author of this design leaves space for two residential shops and two lock-up shops in Melmoth Place, the board room and superintendent's quarters being built over the latter, and the entrances in the centre. The ladies' swimming bath is brought nearer the front, and the slipper baths are placed at the side and beyond, the men's slipper baths being between the same and the first-class swimming bath. The plan is simple, with a long corridor down the side of the site to the public washhouse at the back, the establishment laundry being placed between this and the second-class swimming bath. In this instance, also, the author leaves an area at the side of the site for purposes of light, into which an emergency exit from the gallery surrounding the men's second-class bath delivers. The details of the scheme appear well worked out on the good set of drawings submitted.

Design No. 40-41 shows the front portion of the building as a detached block, with entrance roads on either side, which gives access to a court behind, from which are entered the ladies' baths. The right hand side of the site is treated as an open space, from which entrances are provided to the various departments—a scheme which does not commend itself on account of the expense of administration. No. 42-44 brings the women's baths to the front, with a central corridor to the men's baths, the slipper baths being on the left, the second-class swimming bath being on the right, and the first-class at the end of the corridor. The establishment laundry is not well placed, and the staff inter-communication is defective; the elevations are not well grouped. 45-46, with a better elevation, is needlessly extravagant in corridors, which are continued from back to front of site, for both sexes. 51-54 shows the public laundry in the middle of the site, entered from Melmoth Place, while the plan also has other defects. The elevations are designed in a quiet, unostentatious manner. 59-61 has a good elevation, but a poor plan. 63-65 recesses the centre of Melmoth Place front, the wings of which are given up for commercial purposes. 66-67 brings the refreshment room to the front, while 68-70, with a good plan, sets the whole building back from the frontage with a quadrangle, thus utilising the whole of Melmoth Place for commercial purposes. 71-74 occupies the whole frontage for the baths, with the exception of five lock-up shops on the ground floor. The slipper baths are well arranged, but the author has provided an entrance to the second-class swimming bath from Hartismere Road.

No. 75 has a bad plan, with the public washhouse on Melmoth Place. 76-78 gives up the entire Melmoth Place frontage for the baths, but separate first and second-class men's corridors. 1 and 2 groups the slipper baths, in the centre of the site, with the ladies' swimming bath, the men's first-class bath being at the Melmoth Place end, and the second-class adjoining the public wash-house at the Hartismere Road end; space is left for shops on one side. 3-7, with a very laboured set of drawings, has a poor plan. 8-9 also has an internal courtyard behind proposed shops, the slipper baths are grouped at the Melmoth Place end, then the ladies' swimming bath, first-class men's swimming bath, second-class men's swimming bath, the public laundry being at the Hartismere Road end, while space is left at the side for future extension. The establishment laundry, however, is placed in the basement. 10-12 has a good plan, with separate corridors and well arranged slipper baths; although this is certainly one of the best schemes submitted, the elevation is very poor. 13-15 is not so economical in arrangement as the last, but it has good points. The building, however, is brought forward to the Melmoth Place front. 16-17, with a plan of good points, adopts the separate corridor system for each class from the entrance hall, which is, however, too cramped for the purpose, and the refreshment room is badly placed for such an arrangement. The elevations are commercial. 20-22 also gives first and second-class men's corridors, the latter being continued through to the Hartismere Road entrance. 23-24 has made the laundry a separate detached building, except by a communicating passage in the basement, otherwise the plan has good points, although not arranged on commercial lines; the Melmoth Road elevation is characteristic of the author. 25-26 has one of the best elevations but a poor plan, while 27-28 occupies the whole of Melmoth Place frontage for the baths, with a courtyard, otherwise the plan has some good features. 29-30 is painstaking, and provides separate accommodation for "sweeps and dirty boys," but in other respects the plan is one of the poorest. 31-33 with a good plan fails in giving the commercial value to Melmoth Place frontage, while 37-39 is extravagant and defective in plan, although the commercial spirit is recognised in Melmoth Place front.

The cost of the scheme is between £30,000 and £40,000, and although fully recognising the merits of many of the plans submitted, we think Mr. Baggallay, the assessor, has selected the plan which most nearly meets the various circumstances of the case.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

CONSTRUCTION EXAMINATION.

London, W.—F. G. C. writes:—"Having noticed in your columns the question as to what would be the best books for Building Construction Honours, Part II., it has occurred to me that it might prove of interest to state to you that I, having obtained one of the only two medals awarded in Part II. of the Honours this year, studied the subject wholly from Mitchell's Advanced and Honours Building Construction. I may also add that my colleague who obtained the other medal used the same work in his studies."

R.E. SURVEYOR, CIVIL STAFF.

G. R. writes:—"Would you kindly let me know what would be the best books to use in working up for the exam. of Assistant Surveyor Royal Engineer Civil Staff?"

The books to work up for this examination are "Notes in Building Construction," Vols. 1 to 4; Seddon's "Builders' Work"; Wray's "Theory of Constructions"; Col. Moore's "Sanitary Engineering"; Leaning's "Quantities"; Leanings "Set of Contract Documents"; and especially the War Office Schedules, namely, "Schedules of Contract for Works and Repairs to Buildings of the War Department in the Ordnance Factories and Manufacturing Districts" (Harrison and Sons, St. Martins Lane, 16s. 9d.).

HENRY ADAMS.

BUILDING CONSTRUCTION HONOURS STAGE.

J. F. writes:—"Which are the best books to study for the Honours Stage in Building Construction; also, where can I obtain copies of papers set at various examinations?"

Supposing that the candidate has already passed first-class in the advanced stage, he should study Vols. 3 and 4 of "Notes in Building Construction" (Longmans, 21s. and 18s.), and "Modern Architecture" (Crosby Lockwood, 6s.) As an introduction to Vol 4 of the notes, he may read "Adams' Strains in Ironwork" (Spon, 5s.). Copies of previous examination papers may be obtained at South Kensington Museum; or through Messrs. Chapman and Hall, 11, Henrietta Street, Covent Garden, London, W.C.

HENRY ADAMS.

PREVENTING CONDENSATION.

Kirkcaldy.—Des writes :—"I have a large linen factory to erect, with weaving shed roofs, the boarding of which is to be exposed and painted inside similar to others in the locality. Unfortunately, in the existing roofs the condensation drops and causes serious damage and annoyance. I should be glad to know of a remedy for this. Would powdered cork dusted on the wet paint do, similar to that used in steamships? The Factory Act demands that these roofs shall be painted periodically, and if so, would not the subsequent painting spoil the absorptive quality of the cork dust? Perhaps you can suggest some other remedy, but the roof *must* be boarded."

Condensation occurs when heated air comes in contact with a colder body, and more freely when the colder body in non-absorptive. If the roof *must* be boarded, and the boarding must be painted—that is oil painted—it is difficult to suggest anything that will be a complete cure. Cork dust sprinkled upon the newly applied paint would certainly prove a remedy for the time being, but if the boarding has to be periodically repainted the cork dust, by its absorption of paint, would not only be rendered inoperative as an absorbent of moisture, but would also seriously increase the cost of the painting. Something might be done by interposing a bad conductor between the boarding and the outer air, and a 2in. layer of silicate cotton might materially assist in overcoming the trouble; but if the terms "paint" may be construed as sufficiently elastic to include distemper (tempra paint), washable or ordinary, the replacement of a shiny, impervious surface by a dull absorbent one wonld probably effect a cure. H. E.

RIGHTS OF LIGHT AND AIR.

Newcastle.—P. and B. write :—"A built a wash-house right up against B's kitchen window, and its chimney is below the sill of the bedroom window (first floor). B's house has been built about twenty-five years. What remedy has B, who has not consented to it? Can he knock it down or take action for damages."

If B has had the uninterrupted enjoyment of light through his kitchen window over A's premises for twenty-five years, he has acquired a right of light under the Prescription Act, 1832, and he might obtain a mandatory injunction to compel A to remove the obstruction from the kitchen window. It does not appear that any prescriptive right has been infringed in respect of B's bedroom window. There is no prescriptive right to air over A's premises generally; but the smoke from A's chimney might possibly amount to a nuisance. Certainly B would have no right to knock the chimney down. G. H. B.

CIVIL SERVICE APPOINTMENTS.

Shipton.—Anxious writes :—"Will you please state the difference between civil engineers and assistant surveyors in the Civil Service."

The difference in the work of civil engineers and assistant surveyors in the Civil Service is very marked, but the difference between the respective examinations is not so wide. For assistant civil engineer, H.M. Admiralty, the examination is in the following subjects :—Handwriting and spelling, algebra (including quadratic equations), practical geometry (plane and solid), plane trigonometry, graphic statics, chemistry and mineralogy, heat, electricity and magnetism, hydrostatics, hydrodynamics and hydraulics, levelling and surveying (including the use and adjustment of the theodolite and level), preparing bills of quantities, estimates, specifications and professional practice, general building construction (including the strength, uses and properties of building materials, building plant, shoring and scaffolding, calculations of strains in arches, beams and framed structures), sanitary engineering, drawing and design of engineering works (including the construction of railways, roads, harbours, docks, bridges, and breakwaters), architectural drawing (including design and ornament). For assistant surveyor, Royal Engineer Civil Staff, the examination will consist of two parts, and will be in the following subjects, viz :—Part I. Preliminary. Handwriting and orthography, English composition (as tested by writing letters from rough notes), arithmetic (including vulgar and decimal fractions). Part II. Competitive. One of the following at the option of the candidate :—(*a*) architectural drawing, (*b*) engineering drawing, (*c*) preparation of working drawings for details of builders' work. Theory of construction, strength and quality of materials, and description of workmanship, tools and plant. Analysis of prices, measurement and estimate of builder's work, including taking off quantities from drawings and preparing the abstracts and bills of quantities. Sanitary engineering. In addition to the above six subjects a candidate may take up any of the following optional subjects :—Euclid (the first three books), algebra, including quadratic equations, plane trigonometry, geometrical drawing and freehand sketches in outline; chemistry and mineralogy relating to building materials. For second-class assistant surveyor in the Office of Her Majesty's Works, the examination is in the following subjects :—Part I. Preliminary. Handwriting, orthography, arithmetic (including vulgar and decimal fractions). Part II. Competitive. Drawing and design of architectural works, details of construction in foundations, masonry, brickwork, carpentry, ironwork, joinery, plumbers' and sanitary work; rudimentary calculations of strength and applications of materials of construction; measurement of quantities in building works and estimates of cost; specifications for building works; sanitary engineering; practical geometry; algebra, including quadratic equations; rudimentary mechanics; use of surveying instruments; any one modern language. For assistant surveyor in the department of the Director of Engineering and Architectural Works, Admiralty, the examination is in the following subjects :—English composition (so far as regards the ability to write a good letter); mensuration; constructive and working drawings; book-keeping; practical measuring (oral); bills of quantities for, and measurement of artificer's work, and its valuation; composition and properties of building materials; land surveying and levelling, and the elements of trigonometry; algebra, including quadratic equations. The grouping of the subjects may vary in future examinations, but the scope remains about the same. Prospective candidates should watch the advertisement columns of the professional papers and apply to the secretary of the Civil Service Commission for particulars as soon as any examination is announced.

HENRY ADAMS.

Institution of Civil Engineers.—At the meeting held on November 14th Mr. H. H. Dalrymple-Hay, M.I.C.E., read a paper on the construction and equipment of the Waterloo and City Railway, which is one and a half miles long, and consists of two iron tunnels of about 12ft. 6in. diameter. Mr. Bernard M. Jenkin, A.M.I.C.E., described the electrical equipment of the line, the second underground railway that has been built to be worked electrically.

The Arts and Crafts Movement.—In reference to the report of his lecture published in our issue for November 8th, Mr. Walter Crane writes to us as follows :—"The mention of the influence of Scott's writings was rather with the view of showing certain tendencies *favourable* to the later Morrisean revival in art and literature, not as antithetic thereto. Again, there is an obvious mistake in the mention of the Royal Academy, the foundation of which dates from the last century chiefly as a guild of painters. The Arts and Crafts Exhibition Movement, as I stated, really had its origin in the agitation of 1886 for a national exhibition of all the arts, but which petered out in proposals for the mere reform of the Royal Academy, on which the Arts and Crafts men in that movement decided to form their independent society."

Professional Practice.

Bristol.—The Jubilee Convalescent Home which Her Majesty the Queen opened last Wednesday is not a new building, but a boys' boarding school (known as "Waynflete") adapted for its new requirements. The Home stands in its own grounds of about three acres on the border of Durdham Down, and the necessary alterations have been carried out under the supervision of the honorary architect, Mr. W. L. Bernard, who originally designed the building. The only external alteration required was the provision of an entrance on the front or north side, the floor of which is in mosaic. The Home comprises basement, ground floor, and two storeys above, and accommodation is provided for eighty patients. On each floor a long corridor runs from one end of the premises to the other, and into these the whole of the various departments open. The first floor is approached by three sets of stairs, and opening on to the long corridor are dormitories, servants' rooms, nurses' rooms, lavatories and bathrooms, and the chapel, the latter being a handsome apartment, with carved oak panels fitted into the walls. On the second floor are bathrooms. The whole of the plastering was entrusted to the Adamant Co., of Birmingham, who have used their Birmingham waterproof cement for the dados of all the bathrooms and lavatories. Steam heating, with improved radiators, has been installed by Messrs. John Williams and Sons, Queen Street, Cardiff, and the regulators are completely under control in each ward or room. Laundry arrangements are also by the same firm. A fine turret clock has been given to the building by Messrs. Kemp Bros., of Union Street, and many tradesmen have contributed to the equipment of the establishment. It may be mentioned that the doors of the building were thrown open by the Queen touching a jewelled electric button concealed in a solid gold paper weight 5in. long. Since Her Majesty last visited Bristol in 1830, the city has grown from 755 acres to 13,568 acres, its population from 59,000 to 320,000, and its rateable value from less than £200,000 to considerably more than £1,500,000.

Nottingham.—The new Nottingham Central Station, jointly owned by the Great Northern and Great Central Railway Companies, is now rapidly approaching completion. The nature and scope of the work involved the closest application of engineering and architectural skill, and the outlay of vast expenditure, approximating probably to a million pounds. The actual extent of the station frontage is 250ft, and the building will rise to a considerable height. The elevation has been designed in the Renaissance style, and is being built partly of Darley Dale stone and partly of Nottingham pressed bricks. The main feature of the front is the tower, 22ft. square, which rises in the centre to a height of about 100ft. At each end of the elevation there are two very imposing wings, with pilasters on the ground floor and triple cylindrical columns on the first floor, whilst the booking hall, which is 104ft. long, 66ft. wide, and 35ft. high, will be lighted by means of four large semi-circular headed windows with stone mullions and jambs. A number of administrative offices are being provided on the first floor, and these will be reached by means of a balcony running round the booking hall at a height of about 18ft. or 19ft. Adjoining the booking hall is a very large cloak room, 50ft. by 40ft. The largest of the basements is that under the booking hall, measuring 125ft. by 66ft., and the floor of the latter apartment is supported by steel stanchions, plate girders, steel joists, and curved plates. The main luggage subway is 14ft. wide by 13ft. 6in. high, and the walls are of glazed brick. All the drainage and roof water from the station will be dealt with in underground passages connected with the main subway by means of circular culverts, 3ft. in diameter, in which will also be placed the gas and water pipes and electric cables. Though not so wide as the famous station at New

Street, Birmingham, the new Nottingham Central Station covers a larger area, the total area of the site being over twelve acres, and its length 2100ft., or three-eights of a mile; it measures 390ft. at its widest point. The roof, which is entirely of glass supported on steel principals is divided into three spans, those on either side measuring 63ft. 9in., and that over the main lines 84ft. 3in. Both to the north and the south end also there are awnings extending some 222ft. over the bays, and the main roof, which is 420ft. long, has glass wind screens at each end. All the walls in the station proper are faced with glazed bricks, with dressings of glazed vitrified terracotta. The walls of the dining and refreshment rooms are lined with Faience tiles. The floors are to be of ceramic mosaic, and the fittings of walnut. The main platforms (68ft. wide) can be reached from the booking hall by means of a steel footbridge 24ft. wide, and by the public footbridge from Glasshouse Street to Windsor Street. By an ingenious device the hand-rails on the roof are constructed so as to serve as water carriers; also to facilitate cleansing operations. The whole of the offices and buildings will be lighted by electricity. The entire work is under Mr. Edward Parry's, M.I.C.E., direct supervision, and he has been ably assisted by Mr. F. W. Bidder and Mr. A. E. Lambert, who have charge of the engineering and architectural work respectively, whilst Mr. A. A. Barker is the resident engineer. Mr. Henry Lovatt, of Wolverhampton, is the contractor, the excavators of the site and the large bridges for Parliament Street and York Street, with the retaining walls, permanent way, &c., having been carried out by Messrs. Logan and Hemingway.

Keystones.

Glasgow's First Suburban Theatre has just been built at Govan.

An International Art Congress is to be held next year in connection with the Paris Exhibition. The German Emperor has allowed the exhibition in the German Pavilion of the unique specimens of French art preserved in the Palace of Potsdam.

Sir Richard Moon died last week in his eighty-six year. He was chairman of the London and North-Western Railway Company from 1861 to 1891, and was created a baronet at the Queen's Jubilee in 1887 for his great work in railway enterprise in this country.

The British Fire Prevention Committee send us a copy of No. 27 of their publications, dealing with partitions, and state that last week some French floors, partitions and girder coverings were tested, when several foreign Government representatives were present. The results will be issued in due course.

The collection of Burne-Jones' Drawings at the British Museum has been considerably enriched by Lady Burne-Jones, who has presented to the Trustees a portfolio containing about 200 beautiful drawings, many being in coloured chalks, executed by her husband as designs for stained-glass windows and mosaic work.

Big Liverpool Fire.—A fire broke out last week at the timber yard of Messrs. Henry Quayle and Sons, Liverpool. The flames were got under, but sparks fell into Messrs. Grayson's timber stores and the yard of the Liverpool Creosoting Company, both places being gutted. Woodwork fittings for troopships for the Cape were destroyed, the damage being estimated at £100,000.

Sanitary Inspectors' Diploma.—The Education Department has approved the local examinations held by the Examinations Board of the National Union of Teachers as qualifying successful candidates to sit for the diploma of sanitary inspector. Holders of the diploma, the examinations for which are under the supervision of the Sanitary Inspectors' Examination Board, are eligible for appointment as sanitary inspectors under the Public Health Act (London), 1891.

A new Board School at Hackney Wick, N.E., has been opened.

One of the largest London fire stations is now being built at Maida Hill, W.

Ham Church, Surrey, is to have a chancel added to it.

Dr. Samuel Johnson, medical officer of health for Stoke-on-Trent, is dead.

We have received the 1898-9 (Forty-third) Report of the Vestry of the Parish of Chelsea.

A new Conservative Club at Nuneaton was opened on Saturday. Its cost is about £6,000.

The Bristol Society of Artists has presented to the Queen a collection of sketches made by its members.

A Fourteen-storey House in Paris (which is an innovation there) is being built in the Rue Mont Thaber.

A new lock on the Thames, 175ft. long between the gates and 20ft. wide, is being constructed at Shepperton to replace the existing one.

Dissolution of Partnership.—The firm of C. and L. Ower, architects and civil engineers, Dundee, has been dissolved by mutual consent.

The Guild Hall, Newtownards, was opened on Friday. Messrs. Young and M'Kenzie are the architects, and the building has cost £2,000.

A new East window in Gray's Inn Chapel, London, has five lights devoted to five Archbishops—Becket, Whitgift, Laud, Juxon, and Wake.

For building new hospitals at Leeds, the City Council have decided to make application to the Local Government Board for power to borrow £300,000.

A new County Infirmary at Omagh, just completed, has been built by Mr. J. Cothoun, of Londonderry, from the designs of Mr. Owen, of Dublin, at a cost of £13,000.

The County Museum at St. Albans, which has been built at a cost of about £1,700, was opened last Wednesday. It is one of the first purely educational museums opened in England.

Burnley's New Sanatorium.—In the particulars given last week of this building, the name of the architect, Mr. F. S. Button, was inadvertently given as "Britton." We regret this.

"The Green Dragon," Highgate, N., is almost pulled down. It was one of the houses where the burlesque oath known as "swearing on the horns" was administered in the coaching days.

The Bronze Statue of Sir Sidney Waterlow, upon which Mr. Taubman is now engaged, is to be erected in Waterlow Park, Highgate, N., on a granite pedestal in front of Lauderdale House.

The Northern Architectural Association opened its fortieth session at Newcastle last Wednesday evening, when the president, Mr. William Glover, F.R.I.B.A., delivered his inaugural address.

New Birmingham Art School.—The new branch school of art in Moseley Road, built in connection with the municipal school from the designs of Mr. W. H. Bidlake, was opened on Saturday.

The Chair of Architecture and Building Construction at King's College, London, rendered vacant by the death of Professor Banister Fletcher, has now been filled by Mr. R. Elsey Smith, A.R.I.B.A.

A Rubens Exhibition at Brussels is proposed to be held next summer. It is the outcome of the success attending the Rembrandt Exhibition at Amsterdam in 1898, and the Van Dyck Exhibition at Antwerp this year.

The Growth of London.—London south of the Thames has increased, between 1891-6, at the rate of seventy-three per 1,000, and one parish which comprised 62,000 houses in the Jubilee year, 1887, had increased to 102,000 houses in 1897.

New Patents.

1898.—Ventilators, Fanlights, &c.—20,516. R. Adams, London, S.E. The ventilator is hinged at the bottom and carries at the top end a metal frame having a spring latch and a cushion that presses against a curved arm pivoted to the lintel or window frame. The ventilator is opened by pulling the latch downwards and closed by pushing it backwards. Several modifications are shown. The same invention includes levers for releasing panic bolts. One of these levers is enlarged at the upper end and has the word "Push" on it. By pressing this the bolts are released and the door is opened.

Tiles and Bricks.—24,294. R. Bennett, London. The waste material produced in the separation of kaolin from the free silica is ground, made plastic with water, moulded and fired. The following proportions are given: Waste material, fifty-five parts; ball clay, thirty-three parts; flint or china stone (granite or Cornwall stone) or both, twelve parts.

Saw Guards.—24,861. W. A. Webster, Preston. A canopy (consisting of two wood side cheeks fixed to a semi-circular metal frame) fits over the saw, and is carried by parallel bars pivoted to a bar that is adjustably secured to a standard. The canopy has anti-friction bowls, and is counter balanced.

Band Saws.—25,623. A. Ransome, London, S.W. This invention relates to horizontal band saws, such as are used for cutting logs. The driven pulley carrying the saw has inside and outside bearings, so that it may move away from the driving pulley to get the desired tension on the saw. By means of gearing and nuts the saw may be made to run in any desired position on the face of the pulley.

Door Bolts.—26,318. J. May, Bolton. The bolt is mounted in the usual way, but has a spring which tends to push it outwards. Extending through the door, with a knob on the outside, is a rod that is directly opposite the knob on the bolt when the latter has been pulled back into the side slot. After the door has been closed it is thus possible to push in the knob on the outside in order to press the bolt knob out of its slot, release the bolt, and lock the door.

Pipe Joints.—26,644. E. Putzeys, Brussels. The joint is filled with a packing of fusible composition, in which are embedded one or more electrical wires, through which a current can be sent to fuse the packing, and form a hermetical joint.

Stage Floors.—27,000. E. O. Sachs, London, W. The floor is supported by a trussed arch having vertical side legs which run in guides and are connected with wire ropes, some of which pass over guide pulleys and carry counterbalance weights. Other ropes pass to the drum of a winch. By this means the floor can be raised as desired, and held in place by any suitable locking gear, such as draw bolts.

Drawing Pens.—27,146-47. E. Hervais, Paris. Instead of the working edges being pointed, they are spatula shaped, with a curved edge. This enables lines of any thickness to be drawn without altering the adjusting screw, by merely inclining the pen a little. The second patent consists in forming the blades of drawing pens of round steel wire, inserted in a socket at one end and suitably shaped at the other. This arrangement cheapens the cost. As the blades are too delicate to receive an ordinary adjusting screw, a small clamp is employed instead.

1899.—Surveyors' Levels.—6,981. C. L. Hett, Brigg. Arranged in conjunction with a a telescope fitted with spider webs is an optical square (preferably in the form of a solid glass prism) carried by an oscillating pendulum hung on pivots. The optical axis of the telescope is thus kept parallel to and in the same plane as the axis of the pendulum. The spider webs are adjusted, the instrument is then set up, and a balance weight in the pendulum is moved until the reading is correct by a colimeter. This adjustment can be checked and corrected in the field.

Incandescent Gas Burners.—16,212. H. BURKEST, Berlin. The gas is made to impinge on a platinum ball with depending wires and is thus lighted. The ball is placed directly over the gas outlet, and is so arranged that it is kept cool by an air current.

Mortising Machines.—17,241. W. LANGNER, Breslau, Germany. The upright rotary cutter is driven by hand through gearing, and is mounted in a frame that can be fixed with hand screws on the edges of doors, window frames, &c. The cutter frame slides (being moved as desired by screws), and thus enables the slot to be made. The depth and length of the cut can be varied as required.

Ventilating Fans.—17,591. A. GANS, Urfahr-Linz, Austria. The fan casing is stationary, but the discharge nozzle can be turned so that the current of air is distributed over a larger or smaller area. The fan shaft is mounted in specially arranged trunnions to facilitate removal.

The following specifications were published on Saturday last, and are open to opposition until January 1st. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898—18,483, STEIGER, manufacture of cement. 22,267, McINTIRE, rotary engine applicable also for use as a pump. 22,272, WILLIAMSON, means for generating, purifying, storing, and distributing acetylene gas. 22,404, KASTENS, appliance for the protection of "French" and similar windows. 23,751, circular saw guard. 24,378, ENGELS, manufacture of fire and acid proof bricks, slabs, and other earthenware articles or structures. 24,577, TAYLOR, drop hammer bolt. 24,582, WILLOUGHBY, refuse destructors. 24,762, LAKE (*Campanato*), process for the decoration of articles of wood, metal, stone, glass, &c. 24,957, WOODWARD and COLLIER, process and apparatus for fettling, cutting off, scratching, and otherwise finishing off sanitary pipes and the like while in a plastic or semi-dry condition. 25,227, THUBRON, acetylene gas generators for lamp and other apparatus. 25,384, WHITAKER, steam derrick cranes and excavating apparatus. 25,662, CONSTABLE and SAWBRIDGE, locks and latches fitted with reversible latching bolts. 25,988, GWYNNE and SARGEANT, centrifugal pumps. 26,154, TSCHERNOFF, means for heating by electricity. 26,221, MISSIRE and MISSIRE, *née* MAGNIM, mantles for incandescent gas lighting. 26,572, MOORE, regulation of sliding window sashes in their frames. 26,592, MARCH and HAGGO, nail making machines. 26,613, BOWDEN, apparatus for heating and purifying water. 26,856, KAYSER, mantles for incandescent lighting. 26,923, YOUNG and YOUNG, hooks for cranes and other lifting machinery and appliances.

1899.—786, ALGAR, sash fasteners. 1,042, BACKHOUSE, connecting device for liquid conducting pipes. 3,081, WIGLEY, composition for rendering fabrics fireproof. 6,204, KILNER, furnaces for glass manufacture and other purposes. 6,460, STONE and WHITE, combination spray and jet nozzle for garden syringes, hose, pipes, pumps, &c. 10,151, STEINER, apparatus for generating acetylene gas. 10,798, WHEELER and EELLS, composition applicable as a substitute for wood and stone and for the moulding of hollow ware and the like. 11,135, WORSNOP, acetylene lamps. 11,208, SCHOLEFIELD, method of glazing roofs and structures. 14,377, OKES, covers for man, hand and other holes in vessels subject to internal pressure. 16,454, NICHOLS, apparatus for drying veneers and the like. 16,546, STROUD, wrenches. 17,049, PALMER, ventilation of sewers applicable for other ventilating purposes. 17,067, BUCHNER and SAMET, window blinds, curtains and apparatus for operating them. 17,195, CLARK (*Süddeutsche Metallwerke Schad Herbst and Co.*), acetylene lamps. 17,232, PROST, water heaters for baths. 17,450, RODECKER, window screens. 17,498, WATSON, dust shields for the corners of stairs and other places. 17,631, RICHARD and CAHEN, generation of gas having acetylene as a base and apparatus therefor. 17,648, PATTON and GRANT, fire extinguisher. 17,849, PATTISON, water heaters. 17,928, BURNS, smoke preventing apparatus for steam boiler and other furnaces. 18,342, KIESEL and WATZINA, preparing glass and the like for the production of designs thereon by etching. 18,378, ARNOLD, clamps for holding work to benches and the like. 18,379, ASHLEY, plug taps and valves. 18,388, GOSLING and IMPROVED PATENT FORCED DRAUGHT FURNACE SYNDICATE, Limited, device for equalising the forced draught for steam boiler destructor or other furnaces. 18,803, NEWTON (*Hellström*), combined cornice and curtain hanger. 19,095, WERNICKE, apparatus for wiping or cleaning the panes of shop windows, &c. 19,142, ROBERTS, drawing board rest. 19,379, KRÖHNKE, method of purifying water.

New Companies.

Grimsby Property Company, Limited.

This company was registered on November 10th by Waterlow and Sons, Limited, London Wall, E.C., with a capital of £10,000 in £1 shares, to acquire any real or personal property, and to carry on the business of builders, cabinet makers, joiners, licensed victuallers, market gardeners, &c. Henry Hewins and John C. Store are the first directors, and may retain office so long as they hold twenty shares each. Registered office, Cedar House, Abbey Park Road, Great Grimsby.

Granite Quarries Companies, Limited.

This company was registered on November 2nd by F. J. Leslie and Co., 15, George Street, Mansion House, E.C., with a capital of £3,000 in £1 shares, to acquire and work the Connaught Granite Quarries, at Fallmore, county Mayo, Ireland, and to carry on the business of granite and stone merchants, quarry owners, &c. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers. Qualification, £200. Remuneration as fixed by the company.

THE HATHERN STATION BRICK COMPANY'S

TERRA-COTTA AND BLUE BRICKS.

Colours: DEEP RED, TERRA-COTTA, BISCUIT, TAWNY, and GOLDEN BUFF.

THESE **Terra-cottas** are manufactured from the finest of Clays, specially blended and prepared by the Company's process, and are **fired at such intense heats** as to produce the hardest imperishable material. The Blocks are true to line and dimensions, and the Architect's ideas are faithfully carried out. Every Block is of exactly the same material throughout, the face is the natural clay itself, and absolutely no facing preparations are used. All details furnished are re-drawn to full size to the proper shrinkage scale for each material, and large scale plans are supplied for fixing free of charge.

References will be furnished to many fine buildings designed by Architects of eminence, for Public Purposes, Railway Companies, and Private Owners; and samples of the material and estimates will be forwarded on application.

**The BLUE BRICK WORKS are at CLIFF, near TAMWORTH, STAFFORDSHIRE.
The TERRA-COTTA WORKS and OFFICES are at HATHERN STATION, on the Midland main line, near LOUGHBOROUGH, LEICESTERSHIRE.**

HALL'S - SANITARY - WASHABLE DISTEMPER
(PATENTED),

A NEW SANITARY WATER PAINT,

HAS great advantages, some of which are as follows:

It Sets Hard, Kills Vermin, and Disinfects.
It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.
It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black.
It only requires the addition of Water to make it ready for use, so that anybody can apply it.
It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalters and Ironmongers, and Manufactured by
SISSONS BROTHERS AND CO. Limited, HULL,
From whom Samples, Shade Card, and other particulars can be obtained.
FOREIGN AGENTS WANTED.

COMPETITION.

BURGH of DUNOON.
TO ENGINEERS AND OTHERS.

The Commissioners of the Burgh of Dunoon invite Engineers and others to submit SCHEMES and ESTIMATES for the IMPROVEMENT of the EAST BAY, Dunoon.

The works to consist of the erection of a broad parade along sea front, formation of harbour for goods traffic, widening of roadway, &c.

Premiums of £100, £50, and £25, will be awarded for the Designs adjudged of sufficient merit, and placed first, second, and third, in order respectively.

The Commissioners shall be sole judges as to the merits of the schemes, but they may call in the services of an engineer (not a competitor) to aid them in the adjudication. The Schemes found entitled to the above premiums shall become the property of the Commissioners, but the Commissioners do not bind themselves to carry out any of the Schemes submitted.

Lithographed plan, showing area proposed to be dealt with, levels, and soundings, and copy of conditions, may be obtained from the Subscriber.

All Plans and Schemes must be lodged with the Subscriber on or before JANUARY 31st., 1900.

J. VALROSE CLERY,
Town Clerk.

Town Clerk's Office,

VENTILATION AND WARMING.*

By KEITH D. YOUNG, F.R.I.B.A.

THE subjects of ventilation and warming which we are now to consider are so closely connected with each other that they cannot with propriety be treated separately. Ventilation or the systematic supply of pure air for breathing cannot be accomplished with any approach to success in cold weather unless it be combined with arrangements for warming. Conversely a room cannot be effectively warmed unless due provision be made for the supply of fresh air.

The vitiation of air is produced by several causes: (*a*) by the respiration of human beings and animals; (*b*) by combustion of coal gas, &c.; (*c*) by the decay of animal and vegetable organic matters; and (*d*) by certain processes of manufacture. In the act of breathing we inhale air at the rate of about seventeen respirations per minute, and at each respiration about 30·5 cubic inches of air passes in and out of the lungs.

It is important to note that respired air is raised in temperature to nearly that of the blood—98·4 F. The air which is exhaled from the lungs is robbed of about a fourth part of its oxygen, and an added amount of carbonic acid is substituted, it is considerably more moist, is higher in temperature, and is the carrier of a certain amount of more or less putrescible matter. It is this organic matter which forms the hurtful element in impure air; and because the presence of the organic impurities bears a definite relation to the excess of CO_2, it is customary to regard the latter as the measure or index of impurity.

Air is liable to be vitiated by combustion. The bituminous coal which we burn in our grates gives off three times its own weight of carbonic acid, besides sulphurous, acid and other gases. It also sends out soot, finely divided particles of carbon, and some steam. The products of combustion of coal gas in ordinary burners are carbonic acid, carbonic oxide, compounds of ammonias and of sulphur. Roughly speaking, every gas burner using gas at the rate of 3ft. per hour vitiates the air to the same degree as three men. It must not be forgotten that the escape of coal gas from leaky pipes or mains into houses is a very real source of danger.

Ventilation may be described as such a measure of renewal of air for breathing as will preserve a reasonable standard of purity without producing draughts. At the outset it is necessary to recognise the fact that it would be impossible to keep up such a movement of air in an inhabited room as takes place in the open air, and that it is therefore out of the question to maintain the same standard of purity. The average velocity of the air is said to be about 17ft. per second, and it rarely, in the calmest weather falls below 6ft. per second. It follows from this that, as Sir Douglas Galton points out, the quantity of air flowing over a man standing in the open in one hour would amount to 196,400 cubic feet, and this with a practically imperceptible wind. Since it is impossible to provide in a climate like ours for such an enormous volume of fresh air as would be necessary in order to keep the air of a room as fresh as that outside, it is necessary to adopt some standard of impurity as a maximum which must not be increased.

From a large number of experiments made by De Chaumont on the air of barrack rooms and wards of hospitals it was found that an addition of ·2 per 1000 of CO_2 to the ·4 per 1000 contained in normal air represented the permissible limit of impurity. The object of ventilation is, therefore, to prevent the standard of impurity exceeding ·6 per 1000 of CO_2. Since every adult at rest expires about ·6 CO_2 per cubic foot of air per hour, it needs but a very simple calculation to show that the amount of fresh air required per hour for an adult of either sex when at rest is 3000 cubic feet.

Systems of Ventilation.

It is convenient, though not strictly accurate, to divide methods of ventilation into two classes, one of which is called natural, the other mechanical or artificial ventilation. By natural ventilation I mean that in which the agencies employed are such as are to be met with in ordinary domestic buildings, windows, fireplaces with chimneys and ventilating gratings or openings such as do not require machinery to work them. We have seen that in theory an amount of 3000 cubic feet of air should be supplied per hour to every adult at rest. In our climate it is found that it is not practicable to effect a complete change of the air of a room at a greater rate than three times per hour without causing unpleasant draughts. It follows, therefore, that if every individual is to be equipped with 3000 cubic feet per hour he must be provided with room space of not less than 1000 cubic feet. It will be quite obvious to everyone that such an allowance, however desirable, is altogether impossible; and, indeed, it is not by any means so certain that this amount is either necessary or, in some circumstances, desirable.

If we lived in rooms which were so fashioned that walls, floors, doors, and windows were impervious and air-tight, it would be necessary to adopt some means of ventilation which would be powerful enough to supply the necessary amount of fresh air both for respiration and for combustion of fuel. But the conditions under which we live are very different to this. In addition to the amount of air passing through the spaces afforded by ill-fitting doors and windows a very considerable movement takes place also through the porous materials of walls and ceilings. What is it that causes a ceiling to become black like a gridiron, showing white lines where the joists occur? Simply that where there is nothing over the plaster to check the passage of air the plaster acts like a filter and intercepts the dust carried by the air.

Practical considerations therefore may and should be taken into account in fixing the amount of cubic space to be provided. It will be convenient here to see what is considered necessary in practice: In dormitories occupied by night only by adults or children in health, 300 cubic feet; in barrack rooms occupied by day and night, 600 cubic feet; in elementary schools, 150 cubic feet; in hospitals, from 800 to 2500 cubic feet. The foregoing are from official sources, and may be regarded as more or less of established authority. As to dwelling houses, there is no recognised official standard, but most authorities appear to agree in regarding 500 cubic feet per head as the minimum amount. If we exclude hospitals from our consideration, it will be seen from these figures that the standard of fresh air supply implied by no means reaches the theoretical amount of 3000 cubic feet per head per hour.

The Simplest Mode of Ventilating

a room is to open the windows. In cold weather it is found impracticable to do this, on account of the draughts; and a large majority of people not only close the windows of their bedrooms even in hot weather but shut down the registers of their fireplaces. It is therefore desirable in all dwelling rooms to provide openings for the passage of air independently of the windows and fireplaces.

All ventilation requires for its working three agencies: First, an inlet; second, an outlet; and third, a head or motive power. If one of these three be omitted there can be no ventilation. Head or motive power in natural ventilation may be regarded as a difference of air pressure between two sides of a column of air. This can be obtained either by the action of wind or by a difference in temperature between the outside and inside air. Wind acts either by perflation, as when a window is opened in a room on the side facing the wind and another window or a door is opened on the opposite side, or its action is that of aspiration or sucking, as when a wind passes horizontally over the mouth of a chimney or tube placed at right angles to its course; the effect of this is to reduce the pressure on the air in the shaft and so cause an up-current.

Air, when heated, expands and becomes lighter, and its expansion is in a known ratio to the heat applied. Independent air inlets should bear a due proportion to the outlets for each separate room. The area of any ordinary smoke flue is 81 square inches, and the velocity of the air therein with a fire burning may be taken as 600ft. per minute. This means an extraction of some 20,000 cubic feet of air per hour. To provide for a supply of fresh air equal to the amount extracted at a maximum rate of inflow of 5ft. per second, an opening of nearly 144in. in clear area would be required. The shaft through the wall should be splayed so that the area of the inner opening will be not less than double that of the external opening. By this means the velocity of the air current is considerably reduced, and the incoming air is dispersed over a larger surface. With all air inlets it is important to see that the provision for the admission of air is adequate to the size of the room.

Air Outlets.

To provide openings for the exit of air in an ordinary dwelling room with an open fireplace is, in my opinion, a mistake. The fire is a most efficient extraction shaft, and if other openings are provided they will either become unnecessary inlets, or, if provided with back pressure valves, will be useless. The only way in which an extract ventilator can be usefully employed as an adjunct to the chimney is to place it in the flue itself; and in such a case it must be provided with an efficient flap to prevent the escape of smoke. But it will always be found that if the ventilation of a room is deficient, it is better to increase or improve the air inlet than to add an extract shaft. This question of the provision of sufficient air for the combustion of fuel and for ventilation is, perhaps, the most important one, at any rate in ordinary domestic buildings.

There are many rooms which require to be ventilated independently of open fireplaces, and, of course, rooms with open fireplaces require ventilation at times when the fires are not alight. So long as open windows can be tolerated there is little or no difficulty in ventilating; but when the weather is too cold for this, and fires are, for one reason or another, not available, the difficulty of providing efficient ventilation becomes very great. The problem really resolves itself into how to admit fresh air in sufficient volume without it being perceptible to the inmates of the room.

The Tobin tube is one way of doing this, and, if rightly managed, is a very good one. It is not necessary to make the tube a very long one; indeed, the shorter it is, the better. The main object is to give the incoming air an upward direction, and to cause it to spread as much as possible. The simple expedient of fixing a deep board on the window sill and raising the lower sash a few inches, so that air can flow in between the upper and lower sashes, is quite as effectual, less costly, and less unsightly than a Tobin tube. But there always comes a time when neither windows nor inlet tubes can or, at any rate, will be kept open. And when this happens the resources of natural ventilation are exhausted and recourse must be had to mechanical and more costly contrivances.

Warming.

We must now turn our attention to the subject of warming. Warming may be accomplished by one of several methods:—By open grates, by close stoves, by hot-water pipes or coils either with or without fresh air, by steam, or by hot air produced in a central stove or battery of pipes and delivered through specially arranged ducts. In an open grate the heat rays pass through the air without perceptibly raising its temperature, and warm the walls, floors, and ceiling of the room and the furniture and persons present. These in turn in varying degrees radiate their heat, and so warm the air. The heat in hot-water or steam pipes is conducted from the water to the inner surface of the metal pipe, thence to the outer surface, and thence to the air which it warms by direct contact. In the third system, which for want of a better name is called indirect radiation, the air is delivered to the room ready warmed, and, as a rule, is either propelled into or sucked out of the room by fans or heated extraction shafts.

---

* A paper read, on November 2nd, at the Carpenter's Hall, E.C.

The open fireplace is, and, I believe, will always remain, the universal means of warming for domestic purposes. As I have already pointed out, the heat rays from an open fire pass through the air without raising its temperature to a perceptible degree, and thus while our bodies are warmed we breathe air at normal temperature.

Fireplace Design.

The essential principle to be observed in the construction of an open fireplace is to obtain the greatest amount of heat from the smallest quantity of fuel with the least amount of smoke and the minimum production of cinders. In other words, the greatest possible efficiency combined with economy. Nearly one hundred years ago, Count Rumford pointed out the enormous waste of fuel in London, and the resultant fog and dirt. Since then, no one has done more to improve the construction of the domestic fireplace than Mr. Pridgen Teale, the distinguished surgeon of Leeds, and there is to-day no more economical or efficient fireplace than the one which bears his name.

The first thing to observe is that iron is the worst material for a fireplace and should enter into its construction as sparingly as possible. The back and sides should be of firebrick and the brick should lean over to the fire. The lean-over not only increases the power of absorbing heat from rising flame but the increased temperature in the firebrick raises the gases to combustion point which would otherwise pass up the chimney unconsumed and thus be lost. As a consequence of the lean-over back the grid on which the fire is laid must be deep. Mr. Teale fixes the depth at not less than 9in. for a small room, and not more than 11in. for a large one. The sides or covings should be vertical but inclined to one another as the sides of an equilateral triangle the apex of which would be behind the fireplace and the base in a line with the front. The working out of the inclination to be given to the sides was arrived at by several stages; but in the result it was based on the fact that the greatest amount of radiant heat is thrown off at right angles to the surface of the radiator. The inclination of the sides is such that the perpendicular line from the inner side of one coving just misses the outer margin of the opposite side. Mr. Teale advocates upright bars mainly from the point of view of appearance, because ashes cannot lodge on them. The space under the bars is to be closed by a metal shield called an "economiser," which cuts off the stream of air that usually rushes through the bottom of the fire, thus making the heated coal dependent for its combustion on the air passing over the front and the upper surface.

Before leaving the subject of open fires, I must refer to the grate having an air-chamber behind the fire, the object of which is to admit warmed fresh air into the room as an auxiliary to the radiant heat from the burning coal. Several kinds of grates on this principle have been devised, among the most successful being those designed by the late Sir Douglas Galton and the late Mr. D. O. Boyd. The Galton grate is made with an air-chamber behind the firebrick back of the grate, to which air is admitted from the outside, and from which a pipe ascends to a grating near the ceiling, whence the heated air emerges into the room. Boyd's grate also has a large air-chamber at the back, but the fresh warmed air is admitted to the room through a grated opening immediately over the fire grate. To my mind the defect in both these grates is the large amount of iron which enters into their construction, and which, while adding greatly to the available heating surface, gives an unpleasant dryness to the warm air. Another grave objection to the use of this kind of grate is that it involves the construction of air shafts, which, if not constantly examined and cleaned out, may become a source of danger. This is especially the case in hospitals where air trunks, whether accessible or not, are things to be avoided.

With regard to close stoves for domestic purposes it may be said they are not, and are never likely to be, much in vogue in this country. We must now consider the methods of

Warming by Hot Water or Steam,

which, in dwelling houses, are mainly used as an auxiliary to open fireplaces, and for warming such places as large halls and staircases, billiard rooms, etc. Hot water or steam has the advantage that, instead of many, there is only one fire to be attended to.

Hot-water heating may be divided into two classes—low pressure and high pressure. In low pressure hot-water work the system is open to the air, and is, therefore, subject to the normal pressure of the atmosphere. In the high pressure system the whole of the pipes are sealed, and the room for expansion of the water is provided within the system itself.

It is very necessary in dealing with any system of hot-water circulation, whether for warming or for domestic uses, to have a clear understanding of the power which produces the circulation. Everyone is familiar with the ordinary domestic hot-water system; a boiler at the back of the kitchen fire supplying hot water to a bath on the first floor. Most people are also aware that water expands when heated; and the result is that a great many people assume that hot water circulates because being lighter it rises to the top. The real cause is this: At the top of the house above the highest point of supply is a cistern whence cold water is conveyed direct to the boiler or cylinder, as the case may be. This descending pipe is a column of cold water which by its greater weight overbalances the column of hot water ascending to the bath and so keeps the circulation going. It is the expansion of the water in the boiler plus the downward pressure of the cold water which causes the movement.

Hot-water warming may be employed either with or without the admission of fresh air. If no fresh air is admitted in connection with the coils or pipes, the ratio of heating surface should be 12ft. linear of 4in. pipe to every 1000ft. of cubic space. If fresh air be admitted over the coils or pipes, this amount should be increased by one-third. This rule is, of course, subject to variation; in rooms, for example, with a very large proportion of glass the amount of pipe would have to be increased. However the pipes are arranged, whether in long lines or grouped in coils or radiators, care should always be taken to ensure that there is plenty of room for cleaning all round.

The following is an important practical point affecting the construction of boilers and cylinders. The weight of a column of water is approximately ½lb. to the square inch of surface; therefore, by every foot of height by which the distance between the cold-water cistern and the boiler is increased, the pressure on the latter is increased by ½lb.

The system known as

High Pressure

need not detain us long. It consists of a coil of small iron pipes built into a furnace, a pipe from the upper part of the coil being continued round the room or building to be warmed and returned into the lower part of the coil. The pipes are very strong, but of very small bore. An expansion pipe is fixed at the highest part of the apparatus, and the whole of the pipes, after being filled with water, with the exception of the expansion pipe, are hermetically sealed. The water in the pipes when heated expands, and would, if it were not for the space left in the expansion pipe, burst the pipes. There being no escape for the steam, the temperature can be raised very considerably above 212deg. Fahr., the boiling point of water. The system cannot be regarded as a safe one, and it is open to the further objection that the intense heat generated in the pipes has a deleterious and unpleasant effect on the air.

Steam heating is not so much in favour in this country as it is in the United States, and, indeed, it is not so well suited to the purposes of direct radiation as hot water. It may, however, be used with advantage in cases where exhaust or waste steam is readily available, or, with careful safeguards against waste, may be used economically with live steam. At the Derbyshire Royal Infirmary steam coils are used in the wards to supplement in case of need the open fireplaces. Each coil is formed of three hinged leaves, made of copper pipes and enclosed in a carefully made iron closet fixed under a window. Gratings in the outer wall admit fresh air to the coil and a horizontal opening at the window-sill level admits the fresh warmed air to the ward. The object of making the coil in three folds is that 33, or 66, per cent. of the heat can be turned off or on at will, and the object of hinging the folds is to allow each one to be swung out separately for cleansing.

So far then for warming by direct radiation. We now have to consider the methods of

Warming by Hot Air,

and in connection with this part of our subject it will be convenient to consider also methods of artificial or forced ventilation.

Warming by hot air may be carried out in several ways. The source of heat may either be a stove or furnace, coils of hot-water pipes, or steam pipes. The heated air may either be propelled into the various rooms by mechanical force or it may be drawn into them by the action of fans or other agencies that suck the air out. In all cases there must be some mechanical force exerted to produce the requisite movement. Some years ago, two medical men at Liverpool turned their attention to the subject of warming and ventilating domestic houses; and though they explicitly affirmed that they recommended the warming of the incoming air and *not* warming a house by hot air entirely, their example led to the construction of a few houses which depended for their supply of warmth entirely on hot air. A house was erected at Chiswick soon after the publication of Dr. Hayward's little book in which the heat for every part was supplied from a furnace in the basement through trunks formed in the walls. The extraction flues were all connected into a shaft surrounding the iron smoke flue from the kitchen range. All windows were hermetically closed and there were no fireplaces. The warmth of the iron flue-pipe produced the necessary up-current in the extraction shaft so long as the kitchen fire was going. When it had been out some time and the flue pipe got cold, its extracting power must have been considerably lowered. I cannot conceive a more objectionable mode of building, and it is not surprising to learn that after four years' occupation it was found desirable to make the windows to open, and to provide open fireplaces in the rooms.

Heating Large Buildings.

When considering the warming and ventilating of large halls, schoolrooms, churches, and the like, it becomes clear that the conditions demand an altogether different treatment from that suitable to domestic buildings.

In a concert hall, for example, although owing to the height of the room, the cubic space per head may be fairly abundant, yet the audience are so closely packed together on the floor that the vitiation of air is as great as if the cubic space were as low in proportion as the floor space. Everybody has felt at times the intensely oppressive feeling of the air in a lofty church which is crowded with people on the floor level but has a vast empty space above. In such a building it is absolutely impossible to obtain effective ventilation without some powerful mechanical means of moving the air frequently and thoroughly.

Methods of Moving Air.

Air may be moved either by aspiration or sucking out or by propulsion or driving in, or by a combination of both methods. If aspiration or extraction be employed the force or motive power is placed in the outlets for foul air. If propulsion, then the motive power is placed in the inlets for fresh air. In the ventilation of the House of Commons both methods are employed. The air is drawn in from the river front by large fans and passed through cotton wool filters before it is warmed or cooled, as the case may be, preparatory to being admitted to the House; and the vitiated air is drawn off by an up-cast shaft in the clock tower, at the base of which is a large fire to induce the upward current.

In the new General Hospital at Birmingham the propulsion, or what is called the "Plenum," system is used. The air is drawn into the main inlet by powerful fans; after passing through a jute screen which is kept watered by a constantly running series of jets it enters the main trunk and passes through the various distributing trunks to the several wards and rooms. The windows are all hermetically closed and there are no fireplaces; the air, therefore, must perforce pass out at the openings provided for the purpose. Although this system has been very largely advertised by its advocates as something quite new, facts do not warrant such an assumption. Five and thirty years ago the Lariboisière Hospital in Paris was warmed and ventilated in two ways. One half of the wards were treated on the propulsion system and the other half on the aspiration or extraction system. And the result of the practical working of the two systems was considerably in favour of the propulsion system. The system consists in forcing fresh air by means of a fan driven by steam power into the wards, the vitiated air being driven out through vertical shafts arranged for the purpose. To all intents and purposes this is what is now called the Plenum system. The application of such a system as this, however carefully contrived, to the wards of a hospital is, in my judgment, a mistake, and a mistake that may be followed by very grave consequences.

Quite apart from the fact that warming by hot air is neither natural nor pleasant, the adoption of such a system, involving, as it does, the absolute closing of all windows, and the construction of long channels and shafts for the conveyance of the air, is entirely opposed to all that experience has taught us in hospital hygiene. Neither is there any solid foundation of fact to show that what is called natural ventilation has failed in such a way as to call for its abolition. On the contrary, there is abundant evidence to prove that the results obtained in hospitals ventilated by natural means are better than in those provided with mechanical appliances and with sealed windows.

There are parts of hospitals, however, which cannot be thoroughly ventilated without the help of mechanical means of moving the air, and in such cases the Plenum system is most valuable. In an operation room, for example, where a large number of students are crowded into a comparatively small area, and where it is essential to change the air thoroughly in a very short space of time, powerful means must be adopted for moving the air. At the operation theatre at

The Middlesex Hospital

the motive power is compressed air ejected into both inlet and outlet shafts through specially constructed nozzles. The fresh air is admitted in the basement through a jute screen, kept moistened by a water spray, into the filter chamber, where it passes through a series of layers of cotton wool; from here it enters the coil chamber, where it is in cold weather warmed by passing over hot-water pipes, and thence passes to the theatre and the anæsthetic room. The action of the compressed air in escaping from the nozzle is to form what is called an air cone. The compressed air enters the small annular space and escapes through the aperture in the periphery or mouth of the nozzle. The effect of this is that the air in front of the nozzle is driven forward with the force imparted to it by the released compressed air, and a partial vacuum is formed behind which is quickly filled up with incoming air. A regular flow of air which can be regulated to a nicety is thus established in the tube. The vitiated air is extracted at two points, the main outlet being at one corner of the theatre in the highest part, and a smaller one over the sinks in the recess, which is only about half the height of the theatre. The actual working of this system is that the air of the theatre can be changed completely ten and a half times per hour without any perceptible draught. Air nozzles are fixed both in the outlets *and* inlets in order that in certain conditions of the atmosphere the force of the incoming air may be assisted by that of the extraction shaft, but as a rule force is used only in the inlet shafts. It has been found possible to operate for many hours continuously in the thickest London fogs with a perfectly clear air in the theatre. In the anæsthetic room, which is very small and lighted only by a sky-light, the air is changed fourteen times in the hour.

The main difficulty to be got over in using compressed air is the noise produced by the escape into the tube. Various devices have been tried, but it is at present not possible to suppress it altogether. I may say, however, that at the Middlesex Hospital the noise has been so reduced that it is not noticed. By increasing the number of nozzles in a tube the output of air can be increased, and by experiment it has been found that three nozzles grouped together in the centre of a horizontal tube give better results than the same number placed at intervals. If, for any reason, it is not possible to use compressed air for the purpose, the same effect can be obtained by the use of steam jets.

Fan Propulsion.

As I have already indicated, motive power can be supplied by means of fans worked either by steam power, by a gas engine, or by an electric motor: and there are many places where a fan can be used where neither compressed air nor steam can be applied. It should, however, be noted that while with the very best form of fan made some proportion of the force is lost by friction, practically the whole of the force is utilised with an air or steam nozzle. A further advantage of the jet system is that the whole of the apparatus is controllable from the engine-room, and that the working parts are of a much simpler and more lasting nature than those in use where a fan is employed.

Surveying and Sanitary Notes.

The Road Repairing Nuisance.—In consequence of this nuisance Dr. J. Fletcher Little, a member of the Marylebone Vestry, will move a resolution that a subway for pipes, wires, &c., shall be made from Tottenham Court Road along Oxford Street and Edgware Road to Chapel Street.

The Surveyors' Institution.—The first ordinary general meeting of the session was held on Monday in last week, when Mr. Thomas Miller Rickman, the president, occupied the chair. In the course of his opening address he suggested the division of the fellowship examination into a preliminary and a final, the former confined to book work and the latter to practice pure and simple. The surveyor's knowledge should be of a wider and more general, if less profound, character than was necessary in some of the more specialised professions. The *status* of the members of the profession had very greatly improved during the last fifty years, and the profession itself had risen in public estimation. To building and measuring surveyors the present state of the skilled labour market was a matter of anxiety. The most acute symptoms of the crisis in the building trades naturally occurred in the metropolis, but the effects would be felt before long both in the quantity and quality of the skilled labour available for building operations in the country districts, which London was sucking dry. The country workshop was now the only nursery of the London building artisan, for it was in the country alone that he found the opportunity of apprenticeship to his craft. The tendency of the time was towards the absorption of the masters in separate trades, and the aggregation of work in the hands of the capitalist employer, who found it to his interest to substitute mechanical for hand processes in every possible way. As regards the men, in every organised calling there was a tendency towards restricting the numbers of those that entered it. He feared that the average quality of the work had declined, and it was here that the decline of the apprenticeship system made itself felt. There was hope that the masters would see the necessity of laying aside their objections to the presence of apprentices in their shops, and would come to some agreement with the men as to an increase in the number of young hands to be introduced, in order to keep the trade alive and prevent it from degenerating as regards quality of work. The revival of the apprenticeship system must come from within, not from without.

Purifying Sewage.—In their report to the Manchester City Corporation Messrs. Baldwin Latham, Percy F. Frankland, and W. H. Perkin, jun., say that an inspection of numerous sewage works has convinced them that there are but three methods of sewage treatment. Sewage could either be disposed of without purification, separated into its constituent elements by precipitation, or destroyed by being resolved into simple and inoffensive materials. They express themselves in favour of the last method, which, in their opinion, is the only one in which any purification proper takes place. They also state that the employment of bacteria in some shape or form is the only practical means available for the purification of sewage. An examination of the land at Davyhulme shows that 125 acres are available for the purpose of treating the sewage by bacterial processes. In order to anticipate the difficulties of the future, as well as to make certitude doubly sure, experiments have been made with the refuse of trade effluents as yet not coupled up with the sewage system of Manchester, and it is found that their effect on the purification processs by bacterial agency "is not likely to be of a serious character." The main conclusions of the experts are "that the bacterial system is the system best adapted for the purification of the sewage of Manchester," and "that any doubts which may have arisen in the first instance as to its suitability, owing to the presence in Manchester sewage of much manufacturing refuse, have, through the convincing results of our experimental enquiry, been entirely banished." The experts also report that "with regard to the amount of sewage which can be purified by a given bed without the latter being over-taxed, our prolonged experimental enquiry has shown that each bed may safely receive four fillings in the twenty-four hours, provided that the sewage has undergone the preliminary subsidence and septic preparation in tanks, and that the bed is accorded about one day's rest in every week. In the event of a bed having been unduly taxed, its efficiency is only temporarily impaired, and can be restored by a few days' repose." The experts advise that sixty acres of bacteria beds should be constructed on the double contact system, and they estimate that this area will be sufficient to purify thirty million gallons of sewage per day. The average dry weather flow of Manchester is about twenty-four million gallons. That a sufficient margin has been allowed for the treatment of storm water and for other contingencies will be apparent after careful consideration of the entire report. One fact is pre-eminently worthy of quotation in this connection. It is found by experiment that the double contact system—that is to say, the method of treating the tank effluent in two bacteria beds—is found to produce a filtrate so pure as to be considerably above the standard fixed by the Mersey and Irwell Joint Board. It is also found that if the filtrate of a first contact bed be mixed with that of the second the resulting effluent conforms to the requirements of the standard. The value of this discovery cannot be over estimated, inasmuch as it indicates that the demands of the experts are, if anything, considerably over rather than under the mark.

NARROW LONDON.

ON Wednesday evening last the Society of Arts opened its 146th session, Sir Frederick Bramwell presiding. As Sir John Wolfe Barry was unable to be present, his paper, of which the following is a summary, was read by the secretary, Sir Henry Trueman Wood.

The daily influx of inhabitants from the outskirts of London to the central parts was, to a great extent, the creation of the last thirty or forty years, and it was no unreasonable estimate to suppose that 960,000 people enter and leave London daily by railways alone, and that the number of roadway vehicles has trebled in the last twenty-seven years. Considering what it was to-day, it might well be asked what would be the traffic thrown on our streets in the next thirty years, when it has been estimated there will be a population of 12,000,000. The County Council's officers estimated the total cost of the new street between Holborn and the Strand at £4,862,000, and the immediate selling value of the new frontages and surplus land at £4,088,000, showing a net commercial loss of £774,000. The great thoroughfare, 125ft. wide from west to east of London, which he advocated, would, with subsidiary connections, be 5½ miles in length, and, yard for yard, would compare favourably with the Holborn-Strand scheme. The nett cost, assuming that the ground-rents were sold at once, would be £5,750,000, and if the ground-rents were retained for sixty years, the street could be made without any ultimate financial burden on the ratepayers. He then dealt with his proposal for crossing the great streams of traffic at different parts. At Hyde Park Corner the west and east traffic would pass under the stream going north and south by means of a broad sunken road, leaving the Knightsbridge road on the north side, and rejoining Piccadilly on the south side. A strip of land of an area of 3·1 acres would be required from Hyde Park and from the Green Park, and practically no buildings would be affected. At Piccadilly Circus the work would be much more difficult and expensive. The north and south traffic would cross under the west and east traffic by means of a central sunken road descending from the north end of the Regent Street quadrant opposite Vigo Street, passing under Piccadilly Circus, and emerging in the Haymarket, the portion under Piccadilly Circus and Coventry Street being in tunnel for a length of some 180 yards. At Ludgate Hill the north and south traffic would be crossed over the east and west stream by means of a low viaduct and bridge leaving New Bridge Street on the west side and joining Farringdon Street on its west side. The natural way of dealing with this crossing would be to form a bridge from Fleet Street to Ludgate Hill, but the railway bridge across the latter made it practically impossible. At Oxford Street and the south end of Tottenham Court Road, the west and east traffic would cross over Tottenham Court Road on the north side of Oxford Street. At Wellington Street, Strand, the crossing ought to form part of the present scheme of the London County Council for their great new street if it was to be a really successful work. The gradient of Wellington Street clearly indicated that the north and south traffic should cross over the Strand. The crossing street would ascend from the corner of Tavistock Street and Wellington Street by easy gradients, keeping to the west side of the latter street, and descend by a grade of one in thirty to rejoin Wellington Street at the north end of Waterloo Bridge. At the passing of the north approach of Southwark Bridge over Upper Thames Street, the crossing street would continue the level of the north end of Southwark Bridge and would be parallel to and to the east of Queen Street, descending to rejoin the existing level at the corner of Cannon Street and Queen Street. The annual saving to the inhabitants of London by improved means of communication Sir John estimated at £2,154,000. His figures showed that in one hour more vehicles and pedestrians passed a given spot in the Strand than in Cheapside or Piccadilly.

Masters and Men.

The Cheshire Joiners have been granted an advance in wages to 8d. per hour.

The Strike at the Simplon Tunnel Works came to an end last Monday, without the men's demand having been granted.

Carters' Strike in Edinburgh.—The fifty carters in the employment of Mr. D. Y. Abbey, of Leith Walk, have come out on strike for an advance of 1s. per week. Their present wage is 22s. for driving a single horse and 24s. per week for driving a pair of horses.

Dispute between the Bricklayers and Plasterers.—There is likely to be friction between the Operative Bricklayers' Society and the Plasterers' Union. Voting papers have recently been sent out by the Council of the Bricklayers' Society asking the opinion of their members upon the question of the repeated attempts which have been made by the plasterers to secure for themselves work which has hitherto been claimed by the bricklayers, this work being floor and wall tiling, including hearths, stoves, &c. The Council naturally strongly object to this action of the plasterers, and word these voting papers evidently with the intention of biasing the members' opinions. It seems to us that this is fighting about work which strictly belongs to neither trade, for only a tile-fixer is properly capable of doing it. If strife occurs it will be most deplorable, for the great loss will not fall upon these two unions, but on the employers whom one or other will strike against. Such internecine strifes are suicidal, and we would suggest that as the work in question is of such a nature that a good workman, whom we should call a "tile-fixer," of either calling is equally capable of doing the work in dispute, it should be permissible for a member of either society, at the discretion of the general foreman, to carry out such work.

Conciliation for the Building Trades.—The Amalgamated Society of Carpenters and Joiners have decided by 8,748 votes against 3,965 in favour of the national scheme of conciliation of the building trades. The proposals embodying this scheme were formulated at a meeting of employers and employed which was held in London on July 27th last. At this meeting representatives attended from the National Association of Master Builders of Great Britain and Ireland, and thirteen of the various trade unions connected with the building industries. The chief lines of the proposed plan are as follows: A board of conciliation is to be established, the objects of which shall be to adjust by conciliatory means all questions relating to hours of labour, rates of wages and working rules generally, that from time to time arise, and may be referred to it by either employers or employees; and by mediation prevent strikes and lock-outs; and assist in the settlement of disputes that may take place in the building trades. This central board is to be composed of thirty members, half of whom are to represent the employers and the remaining half the work people. Local societies are also to be formed for the purpose of settling small disputes. An important section of the scheme is contained in the third rule, which reads as follows:—"In the event of a question arising between the trade societies with reference to demarcation of work, or in the event of any dispute arising between the members of a society or societies and the employers, and failing a settlement between the disputants locally, the question at issue shall be referred to the district committee; and, should this body fail to agree, the matter shall be referred to the central board, and, failing a decision on their part, the matter shall be laid before a board of disinterested referees, whose decision shall be binding on both sides. In all cases work shall go on without stoppage, pending a settlement. The committee to deal with the demarcation of work shall consist of three representatives of each trade affected, and three master builders.

Builders' Notes.

The hope of getting work on the Paris Exhibition buildings is, says the "Labour Gazette," a vain one, and workmen should not risk the journey.

Alleged Unlawful Erections.—At the South Western Police Court Mr. Garrett recently gave an important decision on a summons which the London County Council had issued against the Wandsworth and Putney Gas Company for unlawfully erecting a building which was within 20ft. of the highway. The point in the case was whether the common law over-ruled the private Acts of the company. The gas company was incorporated under three Acts, in one of which they were specifically "empowered to erect such buildings as they thought fit" on certain land scheduled in the Act. Accordingly, they had erected a new purifying house on the edge of their property. Mr. Daldy (for the Council) argued that despite the private Act the company were in the same position as a private landowner, and were amenable to the provisions of the Building Act. Lord Robert Cecil (for the gas company) contended that the private Act gave the company a specific exemption and cited several decided cases in support of his contention. Witnesses were called to prove that it was absolutely necessary for the supply of gas that the purifiers should be erected. Mr. Garrett, in giving his judgment, said he found as a fact that the new building was necessary in the sense that the company would be prejudiced in the supply of gas if they were not allowed to utilise the whole of their space. He dismissed the summons and ordered the payment of £10 10s. costs.

A Clacton Building Dispute.—At the Colchester County Court recently Mr. J. W. Martin, an auctioneer and surveyor carrying on business at Clacton-on-Sea, sought to recover from Mr. G. C. Ward, a London solicitor's clerk, £12 12s. paid on his behalf; as a counter-claim the defendant alleged damages to the amount of £30 19s. 1d. At the beginning of last year the defendant purchased a plot of land at Clacton, on which then stood two villas, and with the intention of having these reconstructed into a temperance hotel, he consulted the plaintiff, who afterwards prepared plans and the work proceeded. The plaintiff's claim of twelve guineas was for a pavement light he had put in at the request of the defendant. With regard to the counter-claim, the Clacton Urban District Council have a by-law which provides that every new domestic building shall possess in the rear an open space varying in size according to the height of the building. The point was whether the converted villas constituted a new domestic building. If it was not a new building, then the by-law did not apply at all, but the plaintiff contended that it was a new building, and he accordingly prepared and submitted plans to Mr. Robinson, the surveyor to the District Council, which provided for an air space of 20ft. at the rear. Defendant, however objected, on the ground that it was an old building, and directed plaintiff to prepare new plans. These plans showed 15ft. air space at the rear, and were approved by the Council, but subsequently it was ascertained that the builder, instead of leaving a space of 15ft. had only left 14ft. 3in., and the work had to be recommenced. At this juncture, Mr. Robinson declared that the building was not in accordance with the plans approved by the Council. This disclosed an amazing muddle in Mr. Robinson's office. The old block plan originally prepared by the plaintiff showing 20ft. air space, and the new section plan, showing 15ft. air space, seemed to have been pinned together by a subordinate in the office, and were actually produced by Mr. Robinson in subsequent police-court proceedings as the plans approved by the Council. Defendant denied having authorised plaintiff to obtain the pavement light on his behalf. Judgment was given for plaintiff on the claim with costs, and the counter-claim was adjourned until December 19th.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
		BUILDING—		
Nov.	24	London, N.—Construction of Culvert	Wood Green Urban District Council ...	C. J. Gunyon, Surveyor, Town Hall, Wood Green, N.
,,	24	Southerndown, Wales—Rebuilding Hotel	....	Linton & Barker, Architects, Westgate-chmbrs, Newport.
,,	24	West Ham—Entrance Gates, &c., at Cemetery	Burial Board	M. Russell, 43, Broadway, Stratford, E.
,,	24	Skipton—Isolation Hospital	Rural District Council	G. E. Bolshaw, 189, Lord-street, Southport.
,,	25	Barry, Glamorgan—Alterations, &c., to School	County Council	T. M. Franklen, County Offices, Westgate-street, Cardiff.
,,	25	Blackburn—Buildings at Gasworks	Gas Committee	S. R. Ogden, Municipal Offices, Victoria-street, Blackburn.
,,	25	Bodmin—Additions to Infant School	School Board	W. J. Jenkins, Architect, Bodmin.
,,	25	Edinburgh—Alteration, &c., to School	School Board...	R. Wilson, 3, Queen-street, Edinburgh.
,,	25	Elgin—Villas	....	C. C. Doig, Architect, Elgin.
,,	25	Great Houghton, Barnsley—Stores, &c.	British Co-operative Society Limited ...	A. B. Linford, Architect, Carlton Villa, Wombwell.
,,	25	Plymouth—Destructor Buildings	Corporation	J. Paton, Engineer, Town Hall, Plymouth.
,,	25	Swindon—Stables, Coach House, &c.	....	W. H. Read, Architect, Corn Exchange, Swindon.
,,	27	Cirencester—Class Rooms at Grammar School	....	Vale & Kingsford, Bldg. Surveyors, Barton-st., Gloucester.

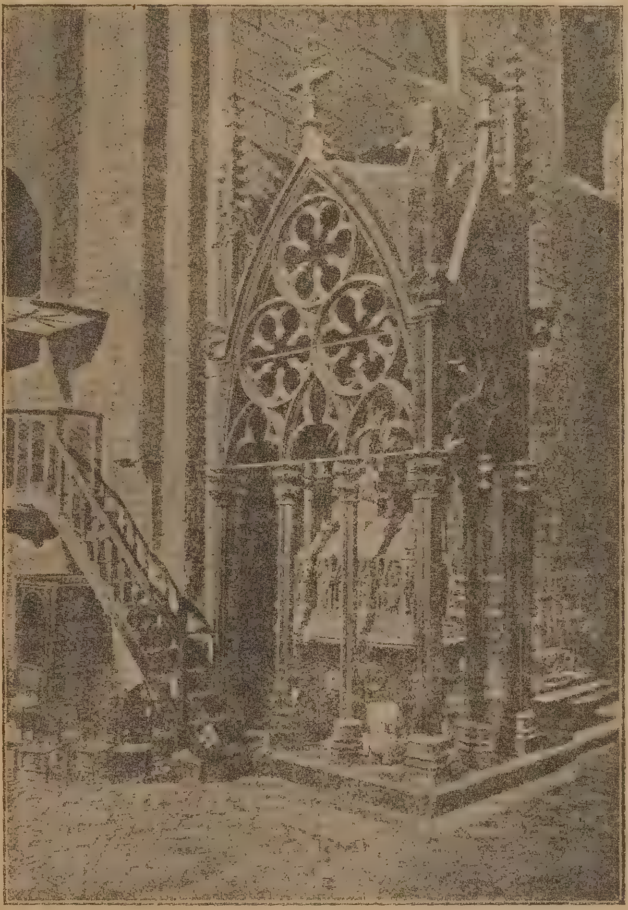
The Cupolas of London. THE pride of London is the great cupola of St. Paul's. It dominates the ancient city, enters into every view, and refuses to be hidden even by the vast modern buildings which have arisen all about it. The situation is unrivalled—the summit of a small steep hill—and emphasizes it to the utmost. In spite of its size, lightness and grace are its chief characteristics; in these it excels St. Peter's at Rome, which suggested the design, and it is further distinguished from it by a magnificent ring of columns, standing out as vertical lines of light against a dark recessed background. Its construction is exceptional; it is vertically triple; an inner vaulted dome of brickwork covers the centre of the church, and is the one seen from within; above this rises a *cone* of brick, which carries the lantern, with its "golden gallery," ball, and cross; outside all is the external dome. It is of wood, covered with lead.

The other churches, rebuilt after the Fire, exhibit many combinations of tower and spire, but, with the exception of St. Stephen's, Walbrook, no dome; and London in the larger modern sense possesses but a very limited number of cupolas. In this it again contrasts with Rome, which is a city of domes; there are more than 350 churches, most of them domed. Of the other cupolas of London two alone are of any importance. One is at Bethlehem Hospital; it rises over the centre of a long façade with an immense garden in front; seen from the South-Western Railway, near Vauxhall, it suggests a little St. Paul's. The other is the cupola of University College, in Gower Street. The architect was Wilkins, a man who was badly treated in his day, whilst his reputation has suffered as much as that of Nash from hostile criticism. His college courtyard in Gower Street is spacious, the portico dignified, and the great stairs leading up to it very ingeniously disposed, though here, as in all cases where a dome rises over a portico, there is a certain sense of conflict between the two features for supremacy. The modern use of cupolas has not been at all happy. There is one rising over the new Admiralty buildings which resembles a distorted Mansard roof, and is perfectly amazing in its ugliness. Another spoils the view of Regent Street, and two more add bulk without beauty to the foot of the Haymarket. Cupolas should be used, where they are wanted, as a great central feature from without, or to cover a hall within; innumerable smaller examples are now rising in London, but, for the most part, they are wanting in grace, and inappropriate to their position. Nothing more effective, however, can be imagined, in towns, than cupolas, provided they be not "stuck on," but arise naturally from the design.

J. C. P.

Royal Tombs at Santas Creus. THE two monasteries of Poblet and Santas Creus, near Tarragona, were a veritable Campo Santo, in which most of the monarchs and nobles of Aragon and Catalonia had their burial places. The sepulchres of those who were buried at Poblet were violated in the revolutionary troubles of 1836, and their bones, having been scattered about the monastery grounds, were piously collected by Don Antonio Serret, the vicar of Espluga, the nearest parish, at considerable risk to himself, and, after reburial in his church for a time, now rest in the beautiful cloister of the cathedral at Tarragona and in the chapel of Corpus Christi: while the body of the great King James I., "El Conquistador," so called from his successful campaigns against the Moors, whereby Valencia and the Balearic Isles were wrested from them and added to his kingdom of Aragon, now occupies a tomb brought from Poblet, but not originally his, against the western wall of the *coro* in the nave of that building.



TOMB OF PEDRO III. OF ARAGON IN THE CHURCH OF THE MONASTERY OF SANTAS CREUS.

The remains of those who were buried at Santas Creus escaped the indignities offered to their companions in arms, and the tombs still contain their tenants. In the cloisters are numerous sarcophagi belonging to the great nobles, but the most noticeable monuments are the two which stand against the piers in the transepts of the church, one on each side of the nave. These are the sepulchres of the two kings—Don Pedro III., son of James I. of Aragon, and his son Don James II. We illustrate the former, which stands on the left and is a work of the end of the thirteenth century. The actual coffin is of red porphyry, and is said to have been a bath in the palace of the Moorish king of Majorca, though others say that it came from Sicily, a trophy of war brought by the great admiral Roger de Lauria. It rests on figures of crouching lions, and is covered with a well sculptured lid enriched with figures beneath canopies, the whole conceived in the manner of a shrine. The canopy beneath which it stands rests upon ten slender shafts of a speckled marble, the name of which escapes me, with carved caps, and consists of traceried circles fitted beneath the curve of an enclosing arch, while pinnacles rise from the corners, at the base of which the symbols of the Evangelists protrude like gargoyles.

The other tomb (of Don Pedro's son, James II.) is richer, but not so satisfactory, and the sepulchre itself is Renaissance in style, having been erected in the early part of the fourteenth century. The style of the sculpture of the canopies would be said to be a century later if occurring in England, and it is remarkable how extremely early Spain felt the influence of the Renaissance. The order for the making of this tomb is dated 1312, two years after the death of the Queen, and the King was buried by her side in 1327, a period when both France and England were in the full swing of Gothic developement and Germany had scarcely emerged from the Romanesque.

The epitaph to Don Pedro is worth quoting as showing what sort of men they were who fought the chivalrous and warlike Moors, and gradually pressed them back to the straits which they had crossed in the eighth century under the victorious commander Tarik, whose name still forms part of the name by which we know them. "Peter, whom this slab covers, subdued nations and kingdoms and cast down the powerful. He occasioned much noise, he realised all his designs, he made his soldiers bold and magnanimous, he who was first in war, now humbly lies here. Unalterable in his purposes, true in speech, loyal in his promises was he and valiant in arms. Governing strongly for equal justice to all he was praised by them, but his vigour of character was above all praise; he adored Christ by the way of repentance whence he received happiness. King of Aragon, Count and Duke of Barcelona, he died the 11th November in the year 1285. May the merciful Virgin Mary be his patroness and instructor."

F. H. J.

Taxing Works of Art.

The question of the Pacca Edict (a law demanding that a duty of 20 per cent. shall be paid on all objects of art exported from the Papal States) is interesting when viewed from an international standpoint. Whilst making no comment, I will simply limit myself to facts with regard to the recent action of the Italian Government in this matter, which will, I think, create a certain amount of surprise. The Diplomatic Corps at the Court of the King of Italy have frequently protested against the application of the 10 per cent. tax established by Article 14 of the Pacca Edict, April 7th, 1820, on objects of art exported by the representatives of foreign States. They sustain their right of exemption from this tax by virtue of the extent established in their favour in the preliminary dispositions of the customs tariffs. The members of the Diplomatic Corps opined that payment for the right to export objects of art should be included under the head of customs dues, from which ambassadors, and other foreign ministers, are exempt, not only with regard to goods they re-export, but also those which they have acquired during the term of their mission. The present Ministry have replied, however, that a distinction must be made between the customs tariff of 1 per cent. paid by exporters of objects of art at the frontier of the Italian provinces and the tax of 20 per cent. imposed by the Pacca Edict in the ex-pontifical provinces, which tax admits of no exception. The controversy which has been going on since 1885 has resulted in the question being taken up by the Minister of Foreign Affairs, who has, in turn, placed the matter before the Council of State. The decision of this Council at the sitting of January 1st last was as follows:—"That the tax of 20 per cent. imposed by Article 14 of the Pacca Edict, 7th April, 1820, shall be levied on all the goods therein indicated upon leaving the State, though they may belong to the members of the Diplomatic Corps."

Another cause of lively protest is the tax fixed upon objects of modern art of 2·50 lire (2s.) on goods valued at 2687·50 (£107 10s.) and under; and of 12·50 lire (10s.) if the value exceeds that amount. This tax was imposed in the ex-pontifical provinces by Pius IX. in his notification dated August 16th, 1848. The Minister of Foreign Affairs, in order to put an end to the dispute, had recourse a second time to the Council of State, enquiring if the maintenance of this latter tax be legitimate in view of the present condition of artistic legislation. The Council of State, however, at the sitting of February 16th last, was of the opinion "that the tax imposed on objects of art exported from the provinces forming part of the ex-pontifical states, in accordance with the notification of August 16th, 1848, has not been abolished, and, consequently, must still remain in force." This decision concerns also the tax on ancient objects prescribed by the same notification, of 12·50 lire (10s.) if the value exceeds 268·79 lire (£10 15s.), and 2·70 lire (2s. 2d.) if the value falls below that amount. An article on the Pacca Edict appeared in No. CCXVII.

Alfredo Melani.

On Reflection.

British Schools.

The British School at Athens has been so successful, and has proved itself of such utility, that it is now proposed to establish a similar school at Rome, a city whose associations and history make it eminently fitted to be the home of such an institution. The proposal is welcomed by the English residents in Rome, and has the cordial approval of Her Majesty's Ambassador to the Quirinal; it may be noted that Germany, France, Austria and America are already represented. As the Italian Government do not allow foreign representatives to make excavations, the school would be unable to do anything in this direction—which forms such a prominent feature of the sister school at Athens; but there is still a great field open to them in the regions of art, archæology and history. Next Spring it is proposed to issue an appeal for the two schools conjointly, for, in order to establish one at Rome, an initial outlay of £3,000 and an annual income of £1,000 would be required, as premises would need to be leased and, most probably, yearly studentships would be offered, as at Athens. Mr. Walter Leaf, of 6, Sussex Place, Regent's Park, N.W., is the honorary treasurer of the British school at Athens.

Commercial Art.

Art and Architecture are synonymous in object, and we therefore make no apology for referring in these columns to a question which, though brought forward in connection with a special work of art, has a very wide and important bearing. We refer to the controversy that has lately been going on in the columns of the "Times" about the late Sir John Millais' world-famous picture, "Bubbles." For those who have not read the various letters that have appeared it may be well to mention that the cause of the present dispute was the statement made by Mr. J. G. Millais, in the memoir he wrote of his father, that the latter had been very much annoyed by Messrs. Pears using his picture for advertising purposes. The picture was seen in Millais' studio by Sir William Ingram, who, being immediately charmed with it, bought it for the "Illustrated London News," by which paper it was used as a Christmas supplement, and enjoyed a very great popularity. Mr. Barratt (Pears' manager) says that he bought the picture from Sir William Ingram for £2,200, had a reproduction made of it, and showed a proof to Millais, who at once exclaimed: "That's magnificent," and later, after Mr. Barratt had mentioned the objection raised by artists that they ought not to paint for advertisers: "What nonsense. I will paint as many pictures for advertisements as you like to give me commissions for." Each side, of course, brings forward proofs, but as matters stand at present the question must remain a moot one, though from what has been stated we are ourselves inclined to believe that Millais did, at the time, favour the transaction. Putting aside, however, these particular facts, and using them only as a theme, what really should be the standpoint of the artist? Should he, under any circumstances, allow his works to be used for the purposes of advertisement? Great differences of opinion have always existed about this, and will probably remain; but (while not in any way wishing to advocate it as a common practice) surely in some cases an artist—or an architect for that matter—may sell his works to advertisers. Why are pictures painted at all? First, because the painter has a sense or inward feeling that compels him to put down on canvas, or paper, or what not a physical representation of what his mind has already conceived to be a reality. But there is another reason in the majority of cases, and one which must not be overlooked. The painter has to live, and to do so he must have money, and his pictures must therefore provide this for him Eminent painters have sold their works to pork packers and to retired grocers who were utterly devoid of any sense of true appreciation. What of these? Is this any worse than selling to an advertiser? For after all, though he buys for mercenary purposes, the public ultimately benefits. Posters and advertisements are now fixtures, and it were better that they should be beautiful rather than hideous. We see no objection in some cases to an artist—even a prominent artist—allowing his picture to be used in conjunction with an advertisement, and think that such a course would injure neither professional dignity (sometimes a supercilious element) nor the artistic ideal.

Architecture in America.

It is always interesting to know what one nation thinks of another, and also in what respect (or disrespect) the various ideas and works are held. For instance, it is interesting to hear what Herr Leopold Gmelin, the editor of "Kunst und Handwerk," has to say about the architecture of America. "The improved condition of Architecture in the United States since the close of the last decade has created a complete revolution in German professional architects regarding the status of America in this branch of Art." This he attributes to the fact that since 1882 a technical specialist has been attached to the German Embassy at Washington, whose reports have had great influence, and, particularly, to the Columbian Exhibition, which the president of the Royal Institute of British Architects recently described as "a work which was magnificent in effect, as all who saw it were agreed." Prior to 1873, the German architect regarded a trip to America for the purpose of architectural study as perfectly ridiculous, but now he thinks otherwise, and with regard to the "sky-scraper" Herr Gmelin says: "We may rejoice in the fact or deplore it accordingly as we incline to the mediæval or to the modern idea of life; but the fact remains that we have before us incontrovertible evidence of a most important cultural development." With this statement many will disagree, for though some of the larger buildings of America can and do demand our admiration, the prevalent style for ordinary houses is sadly incongruous and offending. The mixture of roofs, balconies arranged in most undesirable places, and, particularly, porches of hideous design—these do not tend to the production of a beautiful building. American architects have done much good work, no doubt, but they have also made a vast addition to the deplorable array of architectural abortions (to which our own architects have contributed largely), though the latter may have been everything that could be desired from a constructional point of view. As regards the sky-scraper, which is the outcome of scarcity of land coupled with high ground-rents in the cities, a long lease on the air may be a means of solving a difficult problem, but it does not lend itself to artistic building; and the result is that such buildings are altogether out of proportion and top-heavy. In conclusion we might refer to Mr. Hinkelduyn, the German technical attaché for many years at Washington, who designates American architecture as a happy union between internal utility and external effectiveness. We grant internal utility, but not the other factor.

DESIGNS FOR STAINED-GLASS WINDOWS.

By WILLIAM AIKMAN.

IN the design for the three-light window shown in the accompanying illustration, I have endeavoured to illustrate that at the foot of Christ's Cross all men meet as equals, and as He sacrificed all personal aggrandisement and shared His lot with all men, so must all men share their lot with Him. The soldier must for ever lay down his sword, the begger share his crust, the king his crown and sceptre, and the civic dignitary his office. The cross, which is material at the base where it touches the earth, becomes visionary higher up where it is lost in the brightness of the halo around Christ's head.

This halo is suggestive of the early morning sun, graduating in colour from white in the centre to rose colour in the doves, giving promise of the perfect day. The angels in the upper portion are recording the deeds of mankind on their apparently endless scroll. Growing out of the cross is the Tree of Life bearing its rich fruits, and around the top of the tree is the emerald rainbow, upon which the central recording angel is seated.

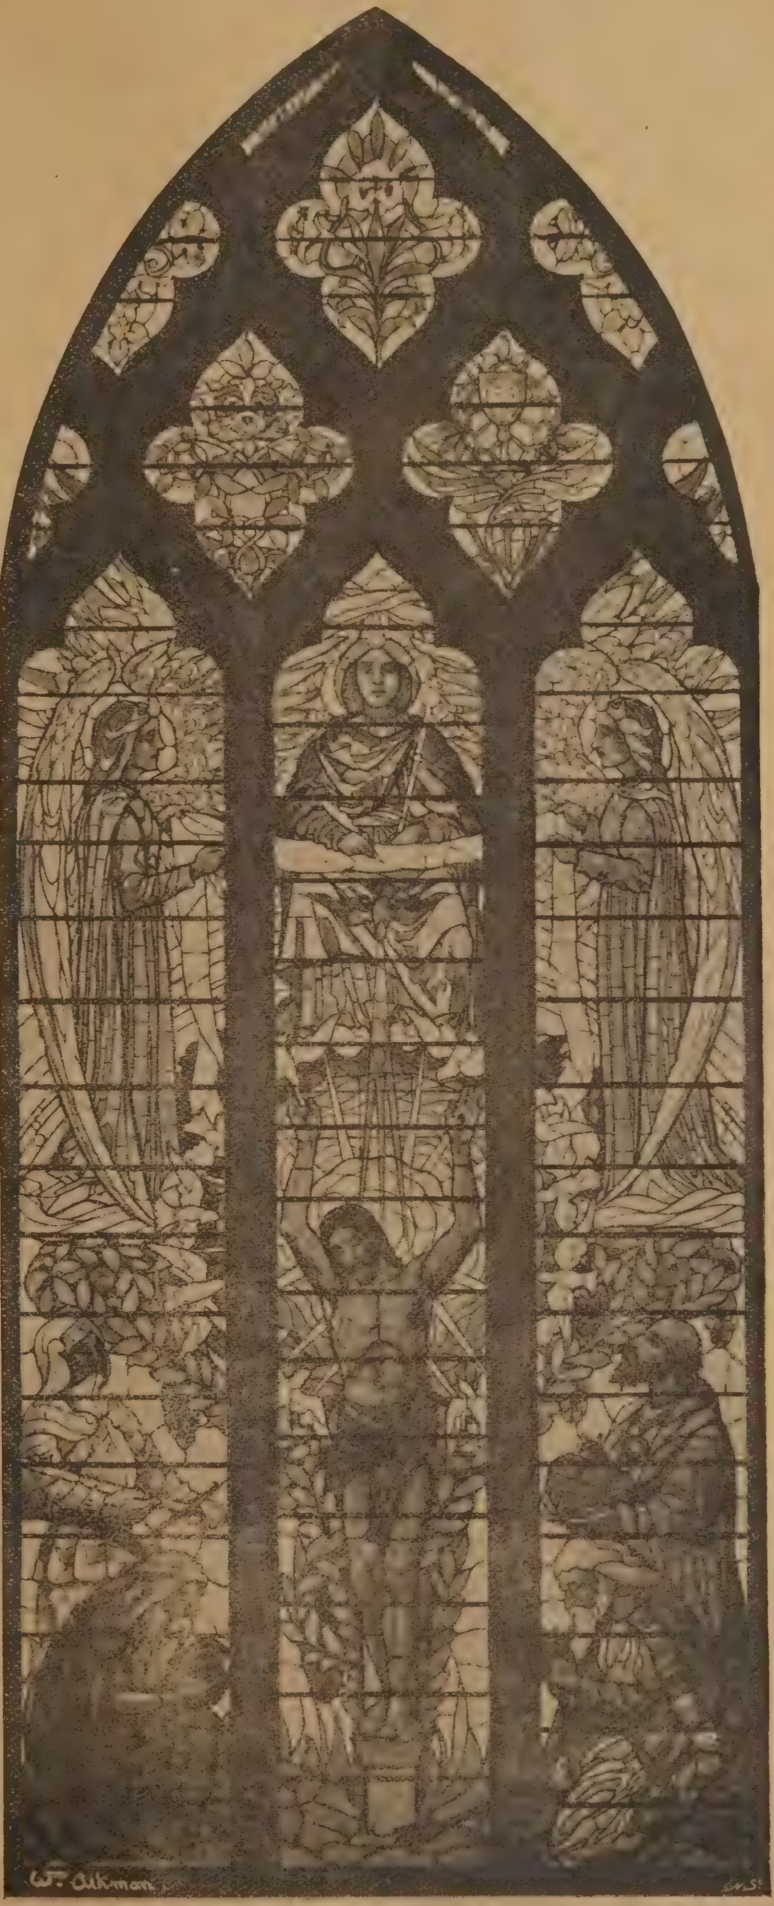
The subject of the two-light window is "The Queen of Sheba's visit to Solomon." In the left-hand light, Solomon is seen in the act of greeting the Queen from his great white throne, at the base of which are seated some of his councillors, while in the right-hand light the Queen is seen bowing to Solomon indicating the passage, "And behold the half was not told me" (Kings I., chapter 10, verse 7). The white throne is that referred to in the same chapter as being of ivory overlaid with gold and having the golden lions on each step. The Queen is surrounded by her attendants bearing her rich presents to Solomon.

The canopies, bases, and tracery are filled with a rich filigree of leaded ornament in place of the usual architectural detail; by this means I was able to carry the rich colour treatment over the whole window.

The "Moses at the Burning Bush" design is for a leaded glass window, the only painted portions being the flesh parts and the outline work on the tree.

I should now like to try to make clear what has always been my aim when designing for stained glass. The first purpose of a sketch for a window is to give a comprehensive idea of what the window will be like when executed, and although finish is not necessary, yet an amount sufficient to indicate little technical specialities peculiar to the designer is desirable. While making the design of the window in sympathy with the architecture of the building into which it is going, I hold that the modern material and appliances must not be over-ridden for the sake of imitative exactness of any given style or period. My observations of old glass tend to show that the craftsmen of the various periods made the most of the material and appliances they had instead of copying what had preceded them.

To paint elaborately one must use a rather flat and smooth-surfaced glass. Now, the finest glasses of modern manufacture are rough-surfaced, streaky, bubbly, and full of all manner of eccentric markings, thicknesses, and colours, which undoubtedly give great brilliancy and charm, but make them wholly unsuitable for imitative painting; and it is this very charming material that is always in my mind's eye when making a design for a window, and this knowledge of the material makes me trust so much to my leaded forms, so that the glass will require as little assistance from the paint as possible, although that little is often desirable. Then, even if the paint does come off, the window has lost only the least of its original charm.



"THE GREAT SACRIFICE": DESIGN FOR STAINED GLASS WINDOW. BY WILLIAM AIKMAN.

DISPUTED POINTS UNDER THE LONDON BUILDING ACT.

By GEORGE H. BLAGROVE,

Certificated Surveyor under the Act; Author of "Dangerous Structures," "Shoring and its Application," &c.

(Concluded from page 224, No. CCXLIX.)

VI.—EXEMPTIONS.

It would seem at first sight that Section 212, which exempts from the operation of the present Act all works to be carried out under contracts entered into before the passing of the Act, would become practically inoperative at a comparatively early date. In London most building contracts are entered into and completed within less than four or five years. But the interpretation of Section 212 depends upon what is deemed to be a contract within the meaning of that section. In the case of *Tanner* v. *Oldman*, it was held that the exemption applies not only to buildings to be erected under a contract with a builder according to definite plans and specifications, but also to buildings to be erected under an agreement for the development of a building estate. The principle here laid down gave a much wider scope to Section 212 than had been anticipated, and has enabled many buildings in the county of London to escape the restrictions of the Act of 1894.

The Question of Exemption and the Question of Use.

Under Section 201, numerous buildings and works are exempted from the operation of Parts VI. and VII. of the Act; but the exemption, in the majority of cases, will be found to depend upon the uses to which the respective buildings or works are applied. In the case of *Coole* v. *Lovegrove* it was held that a building erected by a canal company upon one of their wharves, and let by them to an institution for distributing firewood, was not "used for the purposes of the canal" within the meaning of Section 6 of the Metropolitan Building Act, 1855. That section, although repealed, is substantially re-enacted in Section 201 (8) of the Act of 1894.

Some buildings and works, not specifically mentioned in the Act of 1894, but exempted under private Acts from the operation of former Building Acts, are generally exempted also from the operation of the Act of 1894, under Section 218. The recent case of *London County Council* v. *The Crystal Palace Company* was a case in point. Section 21 of the Company's private Act, 1881, exempted the "main building, conservatories, and waterworks of the Company, and the conveniences and other works immediately connected therewith," from the operation of Part I. of the Metropolitan Building Act, 1855; and this exemption was held to be kept alive by Section 218 of the Act of 1894. The case was otherwise interesting from the question raised as to the meaning of the words "immediately connected therewith." It was held that, in order to claim the benefit of the exemption, the "conveniences or other works" need not be structurally attached to the main building or its conservatories or waterworks, but need only be closely appurtenant to them, or required for use as adjacent appendages. But it was also held that certain detached polo stables situate about a quarter of a mile from the main building could not rank as "other works immediately connected therewith." It is understood that this case will be the subject of an appeal.

Should Notice be given to the District Surveyor?

Some builders appear to be of opinion that it is not necessary to give notice to a district surveyor in respect of buildings and works specified under Section 201. This, however, by no means follows as a matter of course; for that Section exempts such works only from the operation of Parts VI. and VII. of the Act, whereas Section 145, which requires notice to be given before a "building, structure, or work" is begun, comes under Part XIII. Presumably a district surveyor could not require notice of any work in connection with bridges, piers, jetties, &c., nor in connection with public buildings, such as the Mansion House, Guildhall, or the City buildings of the Bank of England. But he could require notice in respect of domestic buildings under Part V.; and it is just conceivable that a building within the station premises of a railway company, inhabited by an official of the company, might abut upon a street, and so come within Section 41. But apart from any such conceivable case, there are instances under Section 201 of partial or conditional exemption, in which it would clearly be the duty of a district surveyor to see that the limits of the exemption were observed, or that its conditions were complied with.

For example, greenhouses, under (15), are exempted, if not attached to other buildings. But if a greenhouse is to be erected, the district surveyor must take cognisance of it so far as to satisfy himself that it is intended, *bonâ fide*, to be used as a greenhouse; and a written statement by way of notice affords documentary evidence of such intention. Also, the surveyor must see that the erection of the greenhouse does not contravene any other provision of the Act. It must not, for instance, be erected above the pavement level in the space required under Section 40, nor above the horizontal line in the space required under Section 41. Also, if it were erected within 4ft. of a party wall, the wall would, presumably, have to be raised, if necessary, above any part of the roof within that distance, in conformity with Section 59 (2); for although the greenhouse would be exempted from the operation of that Section, the party wall would not. Surely, if a district surveyor is to consider such points as the foregoing, he is entitled to demand a notice and to claim a fee. Greenhouses, if attached to other buildings, undoubtedly require notice, because they are

"MOSES AND THE BURNING BUSH": DESIGN FOR STAINED GLASS WINDOW. BY WILLIAM AIKMAN. (*See p.* 253.)

exempt only so far as the necessary woodwork of the sashes, doors and frames; and of course the district surveyor must see that no other woodwork is used in their construction.

Works Totally Exempt from the Act.

Some works not specifically mentioned in the Act are exempt from all its provisions; but many of these are difficult to define, and some of them have been subjects for dispute. For examples, in the case of *Venner* v. *M'Donell*, it was decided that movable seating, consisting of tiers of wooden platforms, erected in the Agricultural Hall, Islington, is not a "building, structure, or work," requiring notice to a district surveyor under Section 145. This is a case which should be very cautiously applied as a precedent, for the Court refused to define "structure" once for all in the Act, and dealt only with this particular case under Section 145.

In three cases certain works were held not to be "wooden structures or erections" requiring licences from the London County Council under Section 13 of the Metropolis Management and Building Acts Amendment Act, 1882; and as this Section has been substantially re-enacted in Section 84 of the London Building Act, these cases still have an interest for us. In *Hall* v. *Smallpiece* the exemption was held applicable to a steam roundabout and shooting gallery. In *London County Council* v. *Pearce*, a wooden building on wheels, used as a builder's foreman's office and as a pay office in the builder's yard, after working hours, was exempted. Section 84 (2) expressly exempts "any wooden structure of a movable or temporary character erected by a builder for his use during the construction, alteration, or repair of any building;" but use as a pay office is not obviously implied here. In *London County Council* v. *Humphreys, Limited*, a bungalow constructed of wood and corrugated iron was exempted, while exposed for sale, and not used or occupied on the spot where it was erected. Evidently such a structure would come under Part VII. of the Act, after it had been purchased and re-erected for use anywhere in the county of London, unless under the conditions specified in Section 201 (10) (11) and (12).

What is a Sky Sign?

In Part XII., Section 127 prohibits the erection of any sky sign; and all licences granted under Section 129 for the maintenance of pre-existing sky signs expired on or before the 24th of August last, and cannot be further renewed. No sky sign, therefore, can now be permitted to exist. It would, however, be interesting to know what species of trade signs are exempt from the operation of Part XII. I have, in a previous article, referred to some trade signs which appear to be projections within the meaning of Section 73. These, however, if coming within that Section, might be maintained by consent of the Council; whereas that body would have no power to sanction the maintenance of a sky sign.

The term "sky sign" is defined in Section 125, and may be stated briefly to mean any device in the nature of an advertisement, attached to any support, "wholly or in part upon, over, or above, any building or structure, which, or any part of which, sky sign shall be visible against the sky from any point in any street or public way, &c."

There are advertisement signs, frequently constructed of open metal work, which project from the fronts of business premises, overhanging the public footway, and distinctly visible against the sky. Are these sky signs within the meaning of Section 125? Being affixed to the fronts of buildings, they cannot be said to be "over" or "above" any building, but are they not "upon" buildings? The question is an important one, because any kind of structure projecting over the public way may easily constitute a public danger.

Chelsea Hospital has had additions and improvements made to it, which have cost £3000. The operating theatre on the third floor has been enlarged, new sterilising and anæsthetic rooms have been provided, and a lift, electric light, and a new hot-water service have been installed.

"THE QUEEN OF SHEBA'S VISIT TO KING SOLOMON": DESIGN FOR STAINED GLASS WINDOW.

(*See p.* 253).

MR. JAMES F. PARKER.

BUILDERS' BENEVOLENT INSTITUTION.

THE fifty-second annual dinner of the Builders' Benevolent Institution took place on Thursday night, the 23rd inst., in the Carpenters' Hall, Throgmorton Avenue, E.C., when the president, Mr. Alfred E. Parker (of Messrs. Patman and Fotheringham, and a member of the Builders' Institute) occupied the chair. He was supported by Messrs. J. Howard Colls, S. Young, W. Woodward, J. F. Parker, H. Bartlett, A. Lucas, B. Ellis, R. Cooper, the Master of the Carpenters' Company, Professor Roger Smith, Hilton Nash, A. Ritchie, C. Bussell, T. Stirling, J. T. Bolding, and others, the company numbering about 160 in all.

It might be mentioned that this Institution was established in June, 1847. According to last year's report, there were twenty-three men pensioners of from 66 to 82 years of age, and twenty-two women from 62 to 84 years of age. Altogether, some 161 men and 122 women have been supported by the Institution for terms of from 1 to 2 up to 10, 11, 14, 19, 21, 24, and 26 years. In these days of many funds, deserving institutions of this nature should not be neglected. Every builder, small or great, should be a subscriber. Even half-a-guinea, given in the hope that it would assist to make cheerier the declining days of some aged colleague or his widow, would be most acceptable; besides days of adversity come to the most prosperous, and if one ever required to solicit the aid of the institution he could do so with more grace, if he could look back to the time when he himself was a willing and cheerful supporter of it. Subscriptions and donations forwarded to Major Brutton, secretary, 35, Southampton Row, will be gratefully acknowledged.

The firm of Messrs. Patman and Fotheringham, of Park Street, and Theobald's Road, W.C., with whom the president is associated, as mentioned above, is one of the oldest in the London building trade. It dates back quite 150 years. Messrs. James Fotheringham Parker and Alfred E. Parker are the present managing partners. Mr. R. S. Parker was the sole partner for thirty years, and his two sons, now managing the business, have had full control of it during the last ten years. Among the buildings in London which the firm have built are the Shaftesbury, Savoy, Palace, Drury Lane, and Tivoli Theatres, Pawson and Leaf's buildings (opposite St. Paul's), and the Queen's Hotel, Leicester Square; while in the country they have done a vast amount of work.

The president gave the toast of "Her Majesty the Queen and the Royal Family," which met with a loyal reception. Mr. Arthur Lucas gave "The Army, Navy, and Auxiliary Forces," to which Major Brutton (the secretary) and Lieutenant Clarke replied. The president proposed the toast of the evening—"Success to the Builders' Benevolent Institution." He said that no severe criticism could be applied to this charity, which was open to all members of the trade, provided that the applicant for relief had always held himself as an honest man. At present there were fifty pensioners on the funds, the men receiving £39 per annum, and the women £27. The committee hoped to be in a position in the coming year to elect all the applicants without putting them to the trouble of an election. Being a young man he looked upon the position he occupied that evening as a great honour, and he hoped that there would be a generous response to his appeal for funds for this most deserving charity. The toast was received with acclamation.

Mr. Basil Ellis gave the toast of "The Worshipful Company of Carpenters." It was a great advantage to have that historic hall for their gathering, and to be associated with a Company so closely allied to the trade. The Corporation and the City Companies had had a great and glorious past, and there was no reason why they should not be even more powerful in the future.

Mr. Arthur Jacobs (the master), in responding, expressed the pleasure the Company derived in giving the hall for such a worthy object.

Mr. J. Howard Colls proposed the health of "The President." Although Mr. Parker was a young man, he was a model president, and he took some credit for having been his *entrepreneur*. The building trade he would add was a somewhat precarious one, in which the percentage of losses was great and the responsibilities unending, and an institution like this was necessary for those who fell out by the way.

The president, in responding, spoke of the great assistance he had received from Major Brutton, Messrs. Stirling, Bolding, Bussell, and others he could name.

Mr. R. Cooper (master of the Distillery Company) gave the toast of "The Architects and Surveyors." Like good soldiers they fought for the health and benefit of the community at large, and it was to them that the public looked for wholesome houses and good sanitation.

Mr. W. Woodward, in replying for "The Architects," said that wherever there was friction between them and the builders, it was caused by a desire to do the best they could for all sides.

Mr. Sidney Young responded for "The Surveyors," adding that the Quantity Surveyor could produce better effects by his pen than by his tongue. He believed, too, that they had the confidence of the London builders.

Dr. Street gave the last toast, "The Vice-Presidents, Committee and Stewards," to which Messrs. Alexander Ritchie and J. T. Bolding suitably replied.

Major Brutton in the course of the evening announced subscriptions amounting to £959, of which the president's list represented £800, including his own donation of 100 guineas. The president added later that through the kindness of a friend the amount would be raised to £1,000.

An excellent selection of music was given, including several piano solos by Signor Tito Mattei, who attended as a guest of the president.

A curious lease is that of Wolsey's Palace in Fleet Street, as, in the event of the house being demolished, it requires that it shall be replaced to a building of exactly the same weight.

The London Statue of Mr. Gladstone.—The Improvements Committee of the London County Council decided, at their meeting on Wednesday, to recommend the Council to allot a site on the new street from Holborn to the Strand to the Gladstone Memorial Committee, for the erection of the national statue to Mr. Gladstone.

MR. ALFRED E. PARKER.
(President of the Builders' Benevolent Institution.)

SOCIETY OF ARCHITECTS.

PRESIDENT'S ADDRESS.

THE first ordinary meeting this session of the Society of Architects was held at St. James's Hall, Piccadilly, on Thursday last; the president, Mr. T. Walter L. Emden, J.P., L.C.C., occupied the chair. After the minutes of the last meeting had been read and confirmed, the following gentlemen were elected:—As associate: Prof. Bhise Shanker Abaji, Bombay. As members: Messrs. E. Archer, London; J. M. Billimoria, Bombay; F. W. Chancellor, Chelmsford; J. P. Crosby, Rickmansworth; J. P. Earle, Sheffield; A. Gorton, Morecambe; D. H. Mirza, Bombay; E. C. P. Monson, London; R. B. Martin, East Ham; J. H. Martindale, Carlisle; H. W. H. Palmer, London; J. Slack, Carlisle; and A. G. Ware, Bournemouth. As student: Mr. T. Falconer, London. In moving the adoption of the annual report and balance sheet, the chairman was glad to say that the increase made in the annual subscription had caused only a few resignations, and he had great confidence that next year the Society would have a considerable balance in hand. He then read his inaugural address.

In again drawing attention to the question of Registration, he wished particularly to impress its importance on provincial architects, as they were most open to the competition of the incompetent and unqualified man. He hoped with the increase of the subscription that many more meetings would be held to spread information on the question than had been possible in the past. In his opinion Parliament must sooner or later protect the public from incompetent, uneducated, and ignorant persons who can and do enter the profession freely and without let or hindrance. With regard to the law relating to light and air, the proposals of the Society would not (though feared otherwise) interfere in any way with the rights of property, but would rather help to protect them, while they would save wasteful and useless expense, and the production, often enough, of disfigurement in our streets.

Referring to the London Government Act of this year, he thought that the course which might fairly have been taken was that the municipalities should have had placed in their hands all the powers which were not absolutely necessary to remain in the hands of a central authority, who should make the by-laws and deal with such questions as main drainage, fire, water, metropolitan improvements, dwellings for the poorer classes, &c., which must be common to the whole of the metropolis. Architects and surveyors would appreciate what he said when he stated that the requirements with regard to building under the present system (or rather want of system) were complicated and overlapping, and that even while in a provincial city it was possible to pass one set of plans, and go only to one authority, in London plans had to be deposited in almost unending succession and with several authorities. When legislation did come about, the Bills were more or less framed by men who had little or no practical or technical knowledge of the questions they dealt with. He thought, therefore, for these and many other reasons, an extremely useful work on the part of the Society would be to try and bring about simplification and codification of the various Acts of Parliament affecting building operations. Even if a thorough codification could not be obtained, opportunity might serve to obtain minor improvements. He had before suggested the formation of a

Technical Court

as saving, in cases of light and air, delay, difficulty and expense; but such a Court might well go farther, and be appointed to try, at all events, certain classes of building cases. The uncertainty with regard to decisions under the present method, as well as its delays, left it not only unsatisfactory, but encouraged litigation, often enough for improper purposes. The Building Act Tribunal in London had proved itself satisfactory so far, and in such technical work as questions of light and air they ought to be, as a technical body, admirably adapted to give just and equitable decisions, and when this was accomplished and had proved satisfactory, then, with such modifications as might be necessary in its constitution, other classes of building cases might go to it.

A Retrospect.

There was one aspect with regard to architectural work which he might touch upon. We were now practically at the end of the nineteenth century, and, in fact, his term of office would be expended for the greater part in the first year of the twentieth century. It was only right, therefore, that he should look back, even if but shortly, at the advances which had been made in the work of the architect since the year 1800. Necessarily, a great deal of the advance came, as it would do, in the train of increasing wealth, as without this the work done could not be either as prolific, as good, or as carefully worked out; and there had been wealth at the command of the architect, for the country had vastly increased in wealth during the century.

At no period of Architecture, he believed, was style and design so debased as in the latter part of the eighteenth and the beginning of the nineteenth century. The squares of London and the rows of houses in many districts which date from that period spoke strongly in this direction with regard to our dwellings, and there were few great buildings of the period to which one could refer with pride. Certainly there was art still in some of the work—he referred rather to detail work—but even then he was of opinion it was poor and thin, and the general design of the interiors was often ill-considered and cold.

One of the best examples of modern architecture, and in his opinion the best example, as a whole, was the Law Courts at Brussels. He particularly considered these buildings good, because they were free from any tricks of art, and there was no attempt at over-ornamentation or of obtaining effect by it. It was the boldness and grouping which gave it its dignity, while the forcible nature of its design appealed to the thinking public to place it, as he believed they did, as one of the best buildings of the latter part of this century. But here in England we had also many buildings which spoke well for the great advance which had been made, and it was found not only in many of our public buildings, but in our great hotels, town halls, theatres, and other buildings; even our shops, and certainly our private dwellings, had made great advances, and the plain wall, with holes in it, had almost ceased to exist. Indeed, there was a strong feeling in London (which had been growing since the days when the old Board of Works commenced its great work of the Thames Embankment) that it should not only be the greatest and wealthiest of the cities of the world, but that it might also become one of the most beautiful. London had many advantages for such a claim; one was its river, another was the fact that the architect being free, and not hampered by the necessity of erecting great boulevards of similar elevation, produced buildings which, from the broken appearance they gave when grouped together, produced a pleasing and picturesque effect, which added much to the beauty of the city, and was far more pleasing to the eye than a more regular style could be.

The accommodation and luxuries of the small villas of to-day compared with the house of a similar class at the beginning of the nineteenth century so favourably that he had no doubt many who compared them wondered how their fathers or grandfathers ever lived in the way they did. The sanitary arrangements, baths, lighting, and a host of other attractions made the present villa a home which would have been envied could it have been seen or known of at the beginning of the century.

Great Improvements.

In no century of English history had such great strides been made. Great Britain itself had grown into the greatest empire the world had ever known. Its wealth had grown with it, and it certainly would be strange if art and architecture had not also. He was pleased to think that not only had the decorative portion of the architect's work made advances, but, what was so much more material, the sanitary part of his work had also equally advanced. When we remembered the many periods at which plague or cholera during the past century had attacked and threatened this country, it was certainly not only a relief, but a very great stride indeed, to know that the work of the sanitary authorities and the advance in the science of sanitation had almost closed the door to its recurrence, and to its consequent panic and fears.

He did not suggest that disease might not make some entry, but that it could not spread broadcast over the country under the sanitary regulations and appliances which were now insisted upon. It would be even more effectually prevented when provincial regulations were made more in accordance with, and more strictly administered with, those of the towns and cities of the kingdom.

No doubt considerable advance had still to be made, and there was room for it in the near future, but what he was interested to show at the moment was the vast difference there was for the better when we compared the state of this country as it is now, so far as this part of the architect's work was concerned, with what it was in 1800.

There was no doubt that during the same period invention and improvements had come upon us to such an enormous extent, and with such rapidity, that many things which would otherwise be considered great were dwarfed and lost sight of; still, but a little thought would show what strides sanitation had made. In the struggle for improvement he trusted that the question of sanitation would always be kept well to the front, as, whatever the wealth of the people, without health it was of little value.

In conclusion, he urged upon members of the profession, and of this Society in particular, that even if their influence, or the time that they could devote to the elevation of architecture and to deal with the questions he had referred to, were small, it was still a material help; not only from the point of view that every little helped, but from the fact that it showed that all were taking an interest; and nothing gave so much encouragement to those who were devoting their best energies to the work as to feel that all were taking this interest in it, and following and helping in the same direction.

In moving a vote of thanks to the chairman, Mr. Silvanus Trevail (vice-president) said the Council had taken great care to see that the qualifications of new members were kept up to a high standard. He regretted very much that those who at present had the drafting of Bills relating to buildings were so incompetent, and thought it was about time that the architectural profession had some influential representation in Parliament, for, since the death of Professor Banister Fletcher, it had none. It was a pity, he said, that the relations between their Society and the Royal Institute of British Architects were not more cordial, but he was of opinion that the latter elected themselves to a position which they were not entitled to take for the whole body of architects. Mr. Robert Walker, the ex-president, seconded the motion. The Registration Bill had been "hung up" in Parliament, and it was their duty to see that it was not strangled. The Bill had received, and was still receiving, great opposition from the Society in Conduit Street.

In the course of the meeting reference was made to the satisfactory way in which the honorary secretary, Mr. Ellis Marsland, and the new secretary, Mr. McArthur Butler, had performed their work.

Under Discussion.

ARCHITECTURAL PROGRESS IN LEEDS.

At the inaugural meeting of the Leeds and Yorkshire Architectural Society, held in Leeds on November 20th, Mr. W. Carby Hall, F.R.I.B.A., the president, said that though there were 367 architects in the Society's area, only fifty-nine were members, while of forty-eight members of the Royal Institute only thirty-six belonged to their society. Hull, for instance, was represented by only one. After commenting on the need for a decorative art museum as an aid to teaching, he expressed the hope that the sketching visits which had been started would result in the promotion of a School of Architecture in Leeds. The unfortunate matter of the bricklayers' strike, he observed, was that the architect saw his buildings practically at a standstill, and was the recipient of many unhappy visits from clients who, as a rule, thought the architect should rise superior to such mundane things as strikes. He hoped the time was not far distant when we should have a Government Labour Bureau, or some similar office, formed for the purpose of intervening at the outset of trade disputes, and thereby preventing the disturbance which under present circumstances ensued. In conclusion, he said he thought they could all thank the City Council for the spirited way in which the many needed improvements were being tackled. Looking back over the past few years it was marvellous to contemplate the progress which had been made in all parts of the city, and he was glad to see that the energy, resource, and enterprise shown by the authorities had produced the same qualities in the minds of the private citizen. It was a pleasure to see Leeds thoroughfares becoming, from an architectural standpoint, more worthy of the fifth city of England. The Society's silver medal goes this year to Mr. W. F. Copp, together with a prize of five guineas, while Mr. S. R. Whincup receives the sketching prize for a similar amount.

REQUIREMENTS OF REAL ART.

Mr. Stuart Carmichael said at Dundee last week, at a meeting of the Early Birds' Club, that art was the expression of an emotion impressed upon a sensitive organisation intensely enough to demand its utterance in line, form, or colour. The art quality could exist with very imperfect craftsmanship, and the spirit of art might live although it disregarded and abused the forms and conventions of art as now acknowledged. Give them drawings, paintings, sculptures, rudely if it must be, but sincerely executed, expressing true personal emotions, and they had a real art which reached the heart and touched the imagination. He who pursued this course was infinitely more the artist than the academic follower of past ideals. The critics, men of letters and of science, and the vast army of those who were incapable of forming an opinion on the aspect of modern art, held themselves as judges, and flung in the face of the artists of to-day the triumphs of the past, saying, "Not until you have reached the beauty of the Greeks in form, have shown yourselves subtler in rendering the mental expression of men and things than the great Gothic artists, rivalled the glory of Venetian colour, shall we adjudge you artist, and capable or likely to give us new sensations and revelations." The effect of this appalling and monstrous demand was that the generality of artists to-day were afraid of being themselves brow-beaten by this consensus of opinion to express not themselves, but pseudo Græco-Gothic anomalies.

AN APPRECIATION OF WILLIAM MORRIS.

The fourth of the lectures in connection with the Arts and Crafts Exhibition was delivered last Thursday at the New Gallery, Regent Street. The subject was "William Morris," and the lecturer was Mr. W. R. Lethaby. There seemed a special fitness in the choice of the subject on such an occasion, for Morris was a former president of the Arts and Crafts Society. The audience, it cannot be doubted, was largely composed of men and women who have been influenced by his work and teaching, and in a room adjoining the lecture hall was a unique collection of his works. The lecturer, too, was eminently fitted for his task, both by knowledge and by sympathy, as Mr. Walter Crane pointed out in introducing him. Mr. Lethaby's lecture was a frank and thorough-going appreciation of the great artist-craftsman; he disclaimed at the outset any attempt to give a judicial and critical study, humorously remarking that much that now passes for criticism in England consists in saying how much better a work of art would be if it had been carried out quite differently; his own attitude was that of a reverent admirer. Confining his attention mainly to the consideration of Morris as an artist, Mr. Lethaby gave a brief biographical sketch of his subject, laying special stress on those incidents in his life which affected his artistic development. The childhood on the borders of Epping Forest, when he read Scott's novels and rode his Shetland pony in the forest; the school-days at Marlborough when he spent his weekly holidays exploring old churches; the college days at Oxford, and the memorable friendships associated with them; the brief architectural apprenticeship in Street's office; the founding of the famous brotherhood which was to wage "a holy warfare against the age"; the building of the Red House at Bexley Heath—that "house of all the talents," which Rossetti described as "more a poem than a house"; the founding of the firm of Morris and Co.; all these episodes were passed in review with many suggestive comments.

On the subject of Morris's textile designs, a unique collection of which is to be seen at the exhibition, Mr. Lethaby was quite enthusiastic. In these patterns, he said, the colour was fair and pure, and always absolutely right; nothing was mineral or acid, and nothing was mawkish or morbid. The drawing was clear and elegant and strong—nothing was loose and vague; as in his written work, there was no finesse or rhetoric of design; all was quiet, inevitable, and great-minded.

Mr. Lethaby summed up Morris's teaching as consisting in the inculcation of four main doctrines: (1) The necessity for re-inventing our eyes, cultivating the faculty of observation as distinct from the mere print-reading faculty; (2) the value of work—mere manual work—in the training of a man as he ought to be; (3) the need for redeeming labour from being a curse by associating it with Art; (4) the need for love of and communion with Nature.

The lecture was distinguished by an admirable lucidity, and by occasional passages of genuine eloquence, with here and there a caustic epigram, generally at the expense of things modern: as, for instance, the description of much so-called "Art" as something which "smells of stuffy rooms, is limp with silly trifling, and stodgy with prejudice;" and the remark, that "the most recent realism would have the artist deal with such subjects as the Gasometer in a Fog."

Correspondence.

SOME SCANDALS OF LONDON STREET MANAGEMENT.

To the Editor of The Builders' Journal.

145, Gloucester Terrace, Hyde Park, W.

Sir,—It would be interesting to know by whose orders some of the main thoroughfares of the West-End are converted into rivers of mud at about eleven o'clock at night. At that hour the roads are flooded preparatory to cleansing, a plan which ensures that, never mind how dry the roads may have been until then, the heaviest traffic of the whole night (that caused by the rush home after the closing of theatres and other places of amusement) is forced willy nilly to plunge into a veritable mud bath. Pedestrians, vehicles, and horses are spattered all over with the filth, the removal of which means an immense amount of unnecessary extra work and expense to a large section of the public. The cleansing should, of course, be done an hour or two later, when the streets are practically deserted, or, as abroad, in the early morning.

The persons who have arranged the abovementioned state of affairs are possibly the same who manage to have roadways and pavements up during the busiest seasons of the year, and then allow two or three workmen to tinker for weeks at the job during the daytime only, whereas a sufficiently large gang should be insisted on for the daytime, with a similar one to relieve it at night. We might then be better able to tolerate the delay in providing the streets with underground passages to contain all pipes, wires, &c.

They are possibly the same persons, again, who have ruined the appearance of our handsomest thoroughfares by lining them with loathsome tin dust-bins, which do not hold the gravel they were designed (save the mark) to contain. The said gravel, having been deposited partly inside and partly outside these doddering monstrosities, is left there. When it is most required, in the event of *sudden* dampness or frost, no one is sent to spread it, and the horses are consequently allowed to suffer for hours with the remedy just in front of their noses.

The police will stand at a point where one horse falls after another, immediately in front of a sand box or heap, and will refuse to throw down a handful of sand themselves or ask a street-orderly boy to do so for them. Such is the lack of humane feeling and the strength of red tape. There are omnibus starting points on the treacherous asphalte paving situated on inclines, where common humanity should demand that gravel be constantly strewn. An unsightly heap of gravel will be found within an arm's length, but it is apparently nobody's duty to use it, except on one of those rare occasions when a hard frost sets in.

Sand-boxes and street-orderly boxes could surely take the form of covered traps sunk in the roadway or pavement, and very little mechanical ingenuity would provide an easy means of raising the contents above ground when desired.—Yours faithfully,

FRANK L. EMANUEL.

THE L.C.C. AND COVERED WAYS.

To the Editor of The Builders' Journal.

London.

Sir,—Seeing that you retain a staff who are willing to give information on constructional matters, I should be glad if they would relieve me from the anxieties of the following conundrum: Is a covered way or hood less dangerous to the general public when attached to a building fortified with a music and dancing licence?

You may be aware that the L.C.C. are refusing permission to erect such hoods even when confined to the projection of applicant's own door step, where there is no such licence, whilst licensed buildings are freely granted the necessary permit, even to the edge of the pavement.—Yours faithfully, W. I.

[The question can hardly be intended seriously. It is obvious that no licence can render a projecting hood more or less dangerous to the public than it would otherwise be. The London County Council can grant or refuse their consent to such structures under section 22 of the London Building Act, 1894; and it appears, from the recent case of *The Coburg Hotel Co. Ltd.* v. *London County Council*, that there is no remedy. It may be that the Council wish to limit the number of projecting hoods, as far as possible, with due regard to public convenience.—Ed. B. J.]

A RUSKIN SOCIETY.

To the Editor of The Builders' Journal.

Tunbridge Wells.

Sir,—With reference to the letter on p. 225, of your issue dated November 15th, there used to be some years ago a "Ruskin Society" in connection with the Westbourne Park Baptist Church (Dr. John Clifford, the pastor, being president.) I had a wish to join it, but, if I remember rightly, the reason why I did not was because the members used to hold their meetings early in the mornings, and living some distance away I was unable to attend.—yours faithfully, C. H. STRANGE.

[We know something of the society our correspondent refers to. It used to meet at seven o'clock in the mornings, but came to an end some time ago, not, we believe, owing to any lack of interest on the part of the admirable enthusiasts who composed it, but owing to the president's change of residence making it impossible for him to attend at such an early hour. Students of Ruskin's works who cannot find a Ruskin Society in their own neighbourhood might do worse than subscribe to "St. George," the excellent journal of the Ruskin Society of Birmingham. It is published quarterly, and may be obtained from the hon. secretary of the society, Mr. J. Howard Whitehouse, Bournville, Birmingham.—Ed. B. J.]

A palace to resist earthquakes is to be built for the Crown Prince of Japan from American plans. It is like a huge steel box, and cannot fall unless there should be a convulsion of sufficient force to turn it over bodily on one side. It will be shipped to Tokio in sections.

Wakefield Cathedral is to be extended as a memorial to the late Rev. Dr. Walsham How at a cost of about £20,700. Mr. Frank Pearson, of London, has prepared the plans. Among other alterations, the chancel is to be extended eastwards for 60ft., and a retro-choir is to be provided.

The Cathedral of St. John the Divine, New York, now being completed from designs by La Farge, will cost no less than two million pounds. £90,000 was paid for the site, £50,000 was spent on the foundations, and the choir will have alone cost £120,000. It is a Protestant cathedral.

The Holy Door of St. Peter's, Rome, will be opened by the Pope on December 24th, at midnight, to inaugurate the Holy year 1900. It will be sawn through on the inside and placed in an iron and wooden clamp, and, after the Pope has struck it with a golden mallet, will be lowered on to a car and carried away for preservation until the end of the year.

The Arts and Crafts Society of Ireland is now holding its second exhibition at the Royal University, Dublin. Amongst the exhibits are some stained-glass designs by Mr. W. J. Douglas, forming part of the decorative scheme for a hall, two wrought-iron gates by Messrs. J. and C. M'Gloughlin Limited, a pillar pedestal in Irish marbles by the Colles Marble Works, Kilkenny, and some specimens of terra-cotta and carved brick from the Lagan Yale Brick and Terra-cotta Works.

TEXTILE FABRICS.

ART AS APPLIED TO THEIR PRINTING AND WEAVING.

By SIR THOMAS WARDLE, K.B.

A MEETING of the Architectural Association took place last Friday night at 9, Conduit Street, W., Mr. G. H. Fellowes Prynne, president, in the chair. The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association:—E. H. Bullock, J. G. Burgess, L. R. Cargill, E. Cooper, J. H. Garry, C. G. Gordon, P. W. Lovell, E. Olarte, N. C. Smith, and J. D. Tate. On the motion of Mr. Prynne a vote of congratulation was passed by acclamation to Professor Elsey Smith upon his appointment to the chair of Architecture and Building Construction at King's College, London, rendered vacant by the death of Professor Banister Fletcher.

Sir Thomas Wardle, K.B, then read his paper on "Art as applied to the Printing and Weaving of Textile Fabrics," which was illustrated by a large number of lantern slides and specimens on exhibition in the room. He said:—

The textile industry is one of the earliest. History and the ancient monuments of Egypt clearly prove its existence for at least 6000 years. It is a pleasing idea that the designing of patterns from the earliest times was predominated by a meaning. The term "unmeaning" so often and so justly applied nowadays, well signifies the patterns as a whole of the last 100 years or more. The meanings which educed the older designs were chiefly symbolical of religious beliefs. The sculptured records of the Assyrians show that this ancient people were not behind in the textile arts. In the Bible we find a number of references to the textile arts; in the thirty-fifth and thirty-ninth chapters of Exodus there are two interesting references.

China.

For thousands of years before our era, China has practised the weaver's and embroider's arts, and, above all other countries, the materials were chiefly of silk. The printing of fabrics in China and Japan is both curious and interesting. Some of it is done without blocks, especially in Japan, by stencilling through stiff paper in which the designs are cut. This work is often enriched by embroidery being worked upon it, and very artistic effects are thus obtained. Of the antiquity of printing in these countries, history does not give us much information, but the treatment of their colouring and designing is of a very traditional kind, the latter belonging to the grotesque and symbolic category; but in flower drawing they excel. We can, I think, safely infer from their modern craftsmanship what was characteristic of their ancient work. A great feature of Chinese designing is their adherence to ancient ideals; and a great reluctance to change or to be influenced by modern styles, for Chinese art in textile work, like that of Indian, rests where it has been for ages. It is impossible in the circumscribed space of one paper to cover the whole archæological textile ground, and therefore the textile work of many countries, such as those of Greece and Rome, must necessarily be omitted. But the

Patterned Cloths of Byzantium

must find a place, especially as our European museums and churches are rich in vestures of that time, and more especially so from the fact that Byzantine patterns culminating probably in Justinian's time did not lose their influence in the pattern designers' mind for many centuries after, say up to the fourteenth century, as I shall be able to show. It is to the Emperor Justinian that Europe is indebted for the great development of Christian art in architecture and textile designing. In this early era, the first half of the sixth century, a new epoch arose and a new style was inaugurated, and its influence, as I have just said, remained as a great artistic power until the thirteenth century. Justinian introduced the cultivation of the silkworm, or sericiculture, into Europe from China, and was not slow to perceive the great importance of the art of silk weaving. He caused imperial factories to be built, and engaged clever designers and weavers from Persia whose influence in Byzantine patterns is easy to see. Closely associated with Bryzantian treatment is the Coptic weaving of the Christian Copts of Egypt, large collections of which have been exhumed from the ancient burial grounds of Sakkarah and Akhinim in Upper Egypt by Mr. Flinders Petrie. The patterning of these cloths is very varied and interesting, and dates from the fourth to the tenth centuries. At Akhinim a printing block was discovered, carved in a pattern. Most likely Egyt was the centre of production of this printed work, whence it was for a long time distributed into Western Europe. Akhinim was for centuries celebrated for woollen fabrics. Next in order follow the interesting designs both woven and printed of

Saracenic or Sicilian inspiration.

At that time, when the Normans conquered northern Sicily, towards the end of the eleventh century, a flourishing school of Arab silk weavers had been established there for more than a century. The Norman kings, who highly appreciated the beauty of these silken stuffs, granted special privileges to the Arab weavers, so that they continued to work their silk looms under the rule of the Christian Conquerers; thus from the eleventh to the fourteenth century Palermo continued to be the chief centre for the production of woven and figured silk. The products of these Sicilian looms were exported widely throughout Europe, especially for ecclesiastical vestments, frontals and dossals. The stuffs woven by these Siculo-Arab craftsmen were of two classes; first, the textiles woven before the Norman conquest in Sicily, 1080-1090; and, second, the textiles of the period when these Arab workmen were employed by their Norman conquerors. In the second period the designs were of endless variety, and showed greater freedom than in the first period, in which the designing done (whether woven or printed) was more from purely Oriental motives, mostly of Persian origin—such as a warrior on horseback, with a hawk on his wrist, attended by a hound. The two chief pieces of printed silk which were used to re-enfold the body of St. Cuthbert in 1104, on the occasion of the translation of the body from the temporary tomb it rested in when the Anglican Church of Durham, where it was originally buried, was pulled down to the tomb prepared for it in Durham Cathedral, are valuable examples of the older class. This proves the antiquity of European tissue-printing, although by Eastern workmen. The artistic weaving of textiles spread from Palermo to Lucca in the middle of the thirteenth century, and after that to Milan, Florence, Bologna, Venice, and Genoa. The Saracenic styles gradually gave way to the more flowing and geometrical forms of the Renaissance, in which the pomegranate became a leading type, and gradually by the end of the fourteenth century figures of animals disappeared totally. Italy became, and is, also a silk-growing country, the mulberry flourished there and with it sericiculture was a certainty. The early Italian dyers practised the tradition of the further East, and with Indigo for blue, Kermes and afterwards Cochineal for red, gave them power in tinctorial application which made their coloured fabrics famous and permanent. We now come to what may be called the Genoese velvet and Italian damask period,

The Period of the Renaissance

and of the Italian painters. Although Italy might have depended more for its Renaissance silk designs upon designers of the craft than upon painters, we know in how many instances painters and architects have excelled, and do still excel, in the decorative treatment of patterned work; and I believe such influence and work can be traced in the designs of some of the great Italian painters' pictures. Take, as an example, Carlo Crivelli, who painted in the middle and latter part of the fifteenth century. In his pictures we see elaborate designs in brocaded silk, indicative and typical of the conventional Venetian brocades and velvets of that time. The patterns he painted are all different in design, but there is a sameness and individuality of diaper treatment which makes me incline to the opinion that he was also a pattern-designer for the Italian weavers and printers of those days. The patterns in the pictures of Fra Angelico and Paulo Veronese in the National Gallery are worth studying, being suggestive of earlier patterned treatment, as well as of influences in artistic design which operated for centuries later. Mr. Sidney Vacher a few years ago did historical designing a great service by working out the designs of dress in the robes of Crivelli's pictures in the National Gallery. In the sixteenth and seventeenth centuries designs were in a transition state between the Italians and later French schools. The diminution in size of patterning was caused by the introduction of Spanish styles of dress throughout Europe. The narrow folds and slashings of the garments required small patterns which took the character of fleurs semées, or strewn flowers. From this time down to Louis Seize, pattern designing underwent a great change. It lost much of that conventional character, which is, after all, the charm and the necessity of a good pattern. We find introductions of naturalistic flowers and foliage; the pomegranate gave way to the flower vase, imitations of ribbons, lace, birds, quadrupeds, horns of plenty, fruit, baskets of flowers, and, lastly, Chinese influences, pictorial representations of scripture and other subjects, architectural and al fresco scenes reaching into the eighteenth century, and culminating in the time of Louis XVI. From 1800 downwards we arrive at distressing decadence, artistic inspiration gave way to common-place work by common-place designers, and it is not until we come into what I call the Morrisian period of our own times, that pattern designing as a worthy art has reappeared.

Textile Printing.

As a textile printer, I have naturally been chiefly interested in the history of printing as an art rather than pattern weaving. There is no doubt that printing has been carried on for many centuries in Persia, and has developed to a great extent. In Java and Sumatra the printing is done by drawing the design upon cloth with a very small copper kettle containing melted wax. Women generally do this work. They hold the cloth over one hand, and wax or paint in the design with this tiny kettle and its finely pointed spout or tube, through which the wax flows in fine threads which soon harden. The wax is covered over that portion not required to be coloured by dye, or by a second dye if already coloured in parts, and is then mordanted and immersed in the dye, which colours the parts not waxed. The wax is afterwards removed by heating. Both sides of the cloth have to be waxed exactly alike. Spain was a country which early practised the printer's art. It was no doubt introduced by the artistic Moors, for it is known that in 1234 James I. of Spain issued an edict "estampados," meaning stamped tissues.

Indian Bandhana Work.

"Bandhana" is a word used in India to denote tie-and-die work, from the Hindoo word "bhanda," to tie. It is extensively practised in India, particularly in Jeypore and Ulwar. It was the precursor of printing in the silk handkerchief trade in Calcutta and Bherempur, and is a very remarkable means of producting designs in spots, round, oval, or square, and plaids. Previous to dyeing the cloth, certain parts are tightly tied in a pattern work of wonderful ingenuity, requiring much patience. At Baroda I bought a very curious example of what we in England call warp or chine printing—*i.e.*, the warp is printed in pattern before weaving. In this Baroda wedding robe, however, the geometrical effort is produced by first tieing and dyeing the warp and the weft, and then weaving the fabric. It is a wonderful example of patience and skill, and is as costly as beautiful. A series of very old blocks were given to me in Calcutta in 1886 by a Mahomedan bandhana silk printer. They represent the typical pattern designing of India. The blocks are very small. Some of them are 400 years old, and show many of the patterns which have for so long been printed in Lancashire for cotton dress purposes, derived without doubt from ancient Calicut designs like these. The diapers and pine or cone patterns predominate in all Indian ornament; the diaper treatment for centres and the pine or cones for borders.

Native craftsmen in India do not change their craft, their methods, and rarely their patterns. I was frequently told that their forefathers had done the some work from time immemorial. Their favourite way of putting it was—"My ancestors have worked at this for a thousand years." This is well illustrated in the story of Aboo-Seer and Aboo-Keer, related in Lane's edition of the "Arabian Nights Entertainments," and which received amusing confirmation in my own experience when at Peshawar. The love of pattern, ornament, and colour seems to be a part of their nature, and to be almost automatic, although beautifully wrought. Dyeing and printing are two of the great crafts of India.

Designing for the Church,

for furniture or upholstery and for personal decoration have been the three important divisions or uses of pattern work from the earlier times. By the church I mean all religions and their consequent symbolic expression; and I think I am safe in asserting that the decorative and artistic teaching of religious themes and dogmas holds the highest and most important place. At least it was so in India, in Egypt, and in Europe in the earlier times. The reason of this is not far to seek. All religious beliefs have always had an outward expression, and it was customary for many centuries, and ought to be so still, to offer to God the best, both of art and of all human effort. Witness, as a wonderful example, the products of Gothic art, whether in cathedrals or churches, and their adornment by the best painters and artists in glass, in mosaic, in woven and printed hangings of the greatest possible glory and beauty, in embroidery, in gold, silver, brass, and laten work.

Of the designers, history has shown us, that the best painters at one time were also printers. I believe that the best painters of the Renaissance in Italy designed also for woven tissues.

After the Renaissance

pattern-designing slowly and gradually deteriorated, and grew more and more unmeaning, until in the last century and down to the first half of this it had become a mere language of flowers, and patterns of the most unmeaning, and frivolous description. In no domain of art is it more conspicuous than in calico-printing. I defy anyone to look over the Lancashire printer's pattern books of, say, 1800 to 1850 without feeling that artistic design had been dethroned, and in its place coloured patterned treatments had become the order of the day, which were productions of men who for the most part were unable to draw or to conceive an artistic subject, and in the art of colouring displayed the greatest ignorance. English calico printing owes much to Indian patterns, although deprived of the meanings which generally attach to them there. In this respect the patterns are good, but when the designers were left to their own resources the results were generally inartistic and on the wrong side. This rule, however, was not without its important exceptions.

Let us now consider the improvements that have taken place in the latter half of this century. In the first place we must freely acknowledge the influence and teaching of

The Science and Art Department

at South Kensington in training teachers for the numerous Schools of Art in the Kingdom, well fitted for their work in teaching drawing, and, to some other extent, design. I am one of those who almost regret that the word "Design" was omitted in describing the Schools of Art, because I have often noticed that design is successfully taught, particularly in cases where the students possess some sort of faculty for the work, just as knowledge of colouring—a most difficult thing to acquire—can be and is imparted. The state of both design and colouring is much more healthy than ever before in this country, and I believe from the preference frequently given for English decorative work in both wall-papers and printed textiles on the Continent, that we are assuming, if we have not already achieved, the leading position in these matters. Let me refer to the influence of my late friend

William Morris,

a really very great man in whatever department of art you consider him, whether the art of poesy or of ornament. His power, partly intuitive, but mainly acquired by study of olden artistic work in form and colouring, was amazing. I should have known little of printing but for him. After his success in his beautiful wall-paper designing, he appealed to me to join him in an attempt at improving the art of tissue-printing, chiefly for cretonne purposes. Rather rashly, I think, I undertook the task, being led on by the charm of his personality and the wide range and power of his artistic ability. He limited me, however, to most difficult conditions, which may be summed up in a few words—a revival of all the old (and for the most part discontinued) processes of producing and applying colour, and an absolute avoidance of all artificial dyes. All the old books of the last four centuries had to be rummaged up, whether Italian, French or English. The Indian methods had to be studied by myself on the spot, and not only the research but the application of such knowledge presented difficulties such as I should not like again to encounter.

In Modern Work

the designs on wall papers and on textiles, the beautiful tapestry of Morris, and the painted glass designed by Burne-Jones, are among the finest productions of decorative work for public buildings of ancient and modern times. We are rapidly improving, but it is not only in the home that one sighs for improvement; in street decorations one sees unbounded possibilities, both in architectural design and colouring. Then again there are the forbidding cold and colourless interiors of our churches, chapels and public buildings—the true arenas for artistic decorative treatment—and capabilities far more important than the best canvas pictures ever painted. Now, mural painting and mosaic in such buildings are slowly, but happily, becoming a necessity; they nobly repay the cost, for, first of all, our places of worship surely need it most. Our narrow insular prejudices have too long banished art from their dreary interiors, but happily all that is changing, and patterned beauty, instinct with meaning, is gradually driving back prejudice and ugliness. Many houses in the land possess beautifully arranged interiors. But the houses of the poorest can be beautiful, and the elevation of taste is the elevation of life. Matthew Arnold wrote, "In art there's truth; take refuge there." Those of us who cannot afford costly art at home, can and ought to say, "Let our places of assembly be made as beautiful as collective cost and art applied can make them." There is no better investment for public money. Then we must have art galleries and museums in each and every centre of population, as well as periodical exhibitions of contemporary art work to elevate and encourage workers and the public in their leisure moments. The mind in its search for happiness must ever seek to triumph over matter, and so reveal the beauties which lie hidden there.

> In the still air the music lies unheard;
>   In the rough marble beauty lies unseen;
> To wake the music and the beauty needs
>   The master's touch, the sculptor's chisel keen.

THE DISCUSSION.

Mr. Lewis F. Day, in proposing a vote of thanks to the lecturer, said nobody knew more about silks than Sir Thomas Wardle. He would like to get the opinion of the meeting with regard to the meaning introduced into the pattern. Mr. Day wished to protest that ornament was none the worse for being meaningless and none the better for being chock full of meaning. The story-telling business which we found in early art was only an instance of original sin. He did not believe that anyone derived any satisfaction from the story-telling in the decoration of the bed he lied in; and not one-twentieth part of the general public were a little better than these. With regard to Sir Thomas's allusion to the designing by great painters of the Renaissance, Mr. Day thought it was quite possible; with Crivelli it was most probable. He thought that there was a disposition to think that the pattern designer needed the artist at the back of him, as if he were not an artist himself. Many of the designs shown that evening were far too good for a painter to have done. In the old Assyrian and other designs the fact was that the figures of animals, birds, &c., in them were possibly not ornamental designs for a repeat design, as was required to be done in modern work. They were all right so long as the artist would conventionalise to a considerable degree, but no one who could draw like a Landseer could conventionalise them.

Mr. Beresford Pite, in seconding the vote of thanks, ventured to suggest that the first object in designing a textile fabric was to make a design which would repeat itself indefinitely; the outlines were confined, and if we attached a meaning to one part of the pattern we must make up our minds to accept that simple story when repeated *ad nauseum*. But to suggest to us in these enlightened days that the real basis of effective design was to have a meaning attached to it was rather putting the design back to the days when persons were unable to appreciate anything without a story. Another point: the idea that those long bend, flowing curves, which appeared so powerfully in Renaissance designs would do in all cases was erroneous. These curves were applicable for robes or curtains, but not in panels. This application is best seen in the folding of a drapery, and is probably the secret of the success of those designs which have large patterns. Looking at the whole series of designs exhibited at the meeting one became conscious that we had to use the word style, not in its architectural sense, which was wrong. Style was something quite apart from any recognised forms of decoration. The two elements of decorative design were form and colour; men were to be found having only one sense. It was pleasing to hear Sir Thomas Wardle express his belief that a course of persistent observation and study would affect a change in the sense of colour. The showing of designs in their colours and their representation in black and white on the screen that evening had been most valuable as showing that design was more important than colour. The Lancashire designs had at least that effect of design and contrast which would always tell.

Mr. Sidney Vacher said that he had discovered in studying Crivelli's pictures that parts of the same design had been repeated in two pictures. This and other evidences led him to think that the great painters of that time had the patterns at hand to copy from. He doubted that at that time there would have been sufficient work to keep merely a pattern-maker going, and he thought that these painters would not have introduced other men's designs into their pictures, nor could they have gained access to such designs; therefore he believed that the designs were the painters' own. With regard to ornament, he did not think a merely ornamental design was all that was wanted. We were suffering from the quantity of designers who did nothing else but design; the majority who were doing ornament ought to do something else.

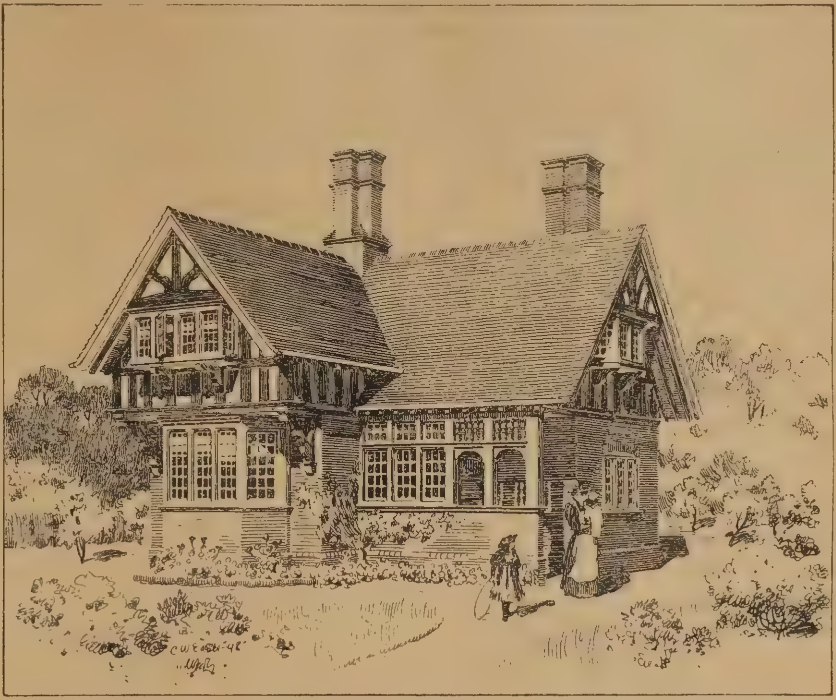
Mr. G. P. Baker was of the opinion that it was not always design which told; the colour was to be considered, and the Lancashire designs which Sir Thomas did not admire had been re-coloured by himself and looked very well.

Mr. W. H. Seth-Smith was sure that all were delighted to hear Sir Thomas Wardle, who was so well able to judge, express his opinion that British art was really taking the lead. He was of the opinion that if in addition to the first impressions and satisfaction which the eyes and the mind received from a beautiful pattern, there were some design and meaning, it would be better; the same remark applied to form and colour. As to symbolism, there was no reason why repetition of form should not weary us any more than design and thought. He was very glad to hear a good word said for South Kensington. Sir Thomas had done great good by introducing the cultivation of silk into Cashmere for weaving.

The chairman, Mr. G. H. Fellowes Prynne, said in the design of textile fabrics it was not a question of style; the influence had not come from either Greece or Rome, but from the East. It was the symbolism which underlies design that was to be noted. Design was very well, but when symbolism was under the design it was of very much greater value. With William Morris's there was always something underlying his designs deeper than mere colour and form.

The vote of thanks having been carried unanimously, Sir Thomas Wardle, in reply, said the chairman had said a good deal of what he had intended to say. All had their beliefs, and he was a firm believer that a motive in this kind of work was desirable; he would even go so far as to say that he would not undertake any work which had not a motive in it. The higher the motive the better would be the work. He could not get up any admiration for those Lancashire designs he had decried. He was quite sure that no colour would make a bad design into a good one. He agreed that a great deal of the effects produced by the French in dress fabrics were by excellent contrast of colour.

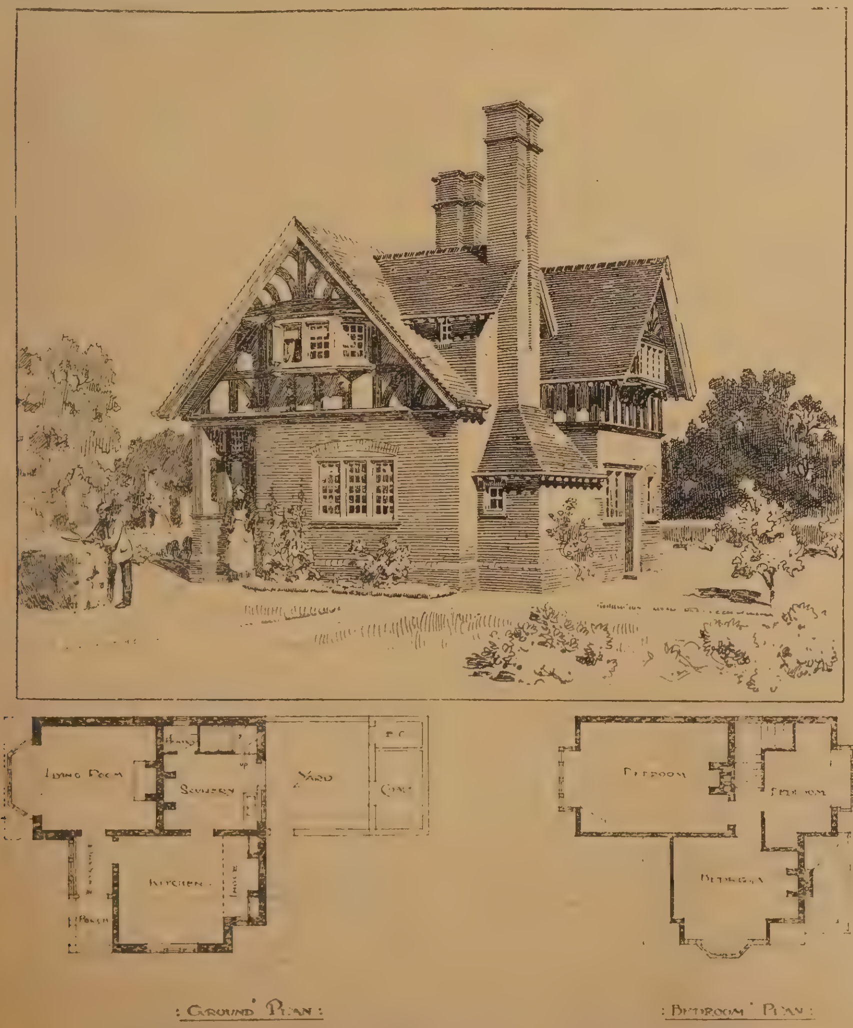
A covered market at Cleethorpes is to be built at a cost of £2,000.



A GARDENER'S COTTAGE AT DOWNE, KENT. W. E. BARRY, ARCHITECT.

A GARDENER'S COTTAGE.

We give on this page plans and elevations of a gardener's cottage which was designed for the late Dr. Barry, at Downe, Kent. It is simple and compact, and looks well with red bricks for the walls, and Broseley tiles for the roof. The architect is Mr. W. E. Barry, of 102, Westborough, Scarborough.



A GARDENER'S COTTAGE AT DOWNE, KENT. W. E. BARRY, ARCHITECT.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

TERRA-COTTA BUILDING BLOCKS.

Darwen, Lancs.—Terra-Cotta writes:—"Can or should the 'filling' of terra-cotta building blocks be composed of ordinary ground mortar and engine ashes mixed?"

Yes; clinkers or cinders mixed with mortar will do, or a small proportion of cement might be used instead of mortar. W. R.

R.I.B.A. INTERMEDIATE EXAM.

Halifax.—F. O. writes:—"What books do you suggest as being most useful for preparing for the R.I.B.A. Intermediate Exam.?"

The books recommended to candidates by the Council of the R.I.B.A. are stated in the "Kalendar," where all particulars of the examinations and sample examination papers are also given. This may be obtained from the Secretary, 9, Conduit Street, London, W., price 2s. 6d. HENRY ADAMS.

IRON BUILDINGS THAT ARE FIXTURES.

H. writes:—"I am renting a carpenter's shop and yard, which is surrounded by a high wall. A few years ago I applied to the owner for, and received, permission to erect a galvanised-iron show-room and office in the yard, a part of the wall forming one end of the building, with a window and door in it, so that it is a permanent structure. I am now thinking of leaving. Can I demand anything for the building?"

You can demand nothing for the building; but possibly you may be entitled to remove it—during the tenancy, not afterwards—as a trade fixture. A. H.

BUILDING CONTRACTS.

Ramsgate.—Builder's Clerk writes:—"I have had a house built, which I was led to believe by the builders (who are also the owners of the other houses and the land adjoining mine) would be built with another house alongside. This they have not done; consequently the party wall, which is mostly built of place bricks with the joints left rough, is now exposed to the weather, $4\frac{1}{2}$in. holes having been left for joists, and chimney openings and flues formed ready for the next house. Can I legally refuse to pay the balance of their contract unless they give me a guarantee to build up against my house within a certain time, or to point the brickwork as required for an external wall? There was no specification—simply a form of contract for a house to be built in every respect the same as the others."

"Builder's Clerk" cannot refuse payment.
A. H.

THICKNESS OF WALL.

SOUTHPORT.—CONSTANT READER writes:—"Kindly give the best method for determining the thickness of a long wall with piers to support roof weight only, and not tied in by any cross walls or floor timbers. Wray and Rivington show the method for fence walls, but such would give an excess thickness, considering that the roof trusses must considerably stay the wall."

There is no difficulty in working out this case when the data are known, but the trouble is to fix upon a suitable wind pressure to allow for. This will be determined by the site and its exposure, and may be for ordinary cases about 28lb. per square foot, blowing horizontally over the whole side of wall and roof. In the case of a long wall, the support afforded by the return at the ends should be left out of account, and the calculation made for, say, one bay, or a length equal to the distance from centre to centre of roof trusses. The weight of the roof on the wall will increase the stability, and will be allowed for as if it were weight of material in the wall itself.
HENRY ADAMS.

SIZES OF TIMBER.

BURTON-ON-TRENT.—F. P. writes:—"Will you kindly give me some particulars of the sizes of timber procurable from the timber merchant; also to what dimensions these will be planed down by the joiner?"

Small timber is stocked by timber merchants in the form of planks, deals, and battens. Planks run from $2\frac{1}{2}$in. to 5in. thick, and from 11in. to 18in. wide; deals from 2in. to 3in. thick, by 9in. and 10in. wide; battens from $1\frac{1}{2}$in. to $2\frac{1}{2}$in. thick, by 5in. to 8in. wide; lengths from 10ft. to 24ft. Saw mills supply converted stuff of each kind, usually quoted as 1, 2, 3, &c., "cut-stuff." The thickness of this may be calculated by allowing $\frac{1}{8}$in. for each cut; for example, a "two cut" 3in. deal will yield three full $\frac{7}{8}$in. boards. These are termed by builders "inch stuff." The average reduction to be allowed for machine planing is, two sides bare $\frac{1}{8}$in., one side full $\frac{1}{16}$in.; hand planing, two sides bare $\frac{1}{8}$in., one side bare $\frac{1}{16}$in. Thus a reputed inch board, planed both sides, will finish $\frac{3}{4}$in. + $\frac{1}{32}$in.; but more must be allowed in the case of cast stuff or "outsides." G. E.

REQUIREMENTS OF MODEL BY-LAWS.

CROMER.—R. CROOME writes:—"Will you kindly give me your valued advice on these two points: (1) I purchased a plot of land 50ft. by 30ft., in a district where the Model By-laws are in force. Being desirous of erecting a dwelling-house on this plot, I find there is no sewer nearer than 400 yards, whilst the By-laws say that a cesspool must not be built within 50ft. of a 'dwelling-house or public building, or any building in which any person may be employed,' &c. What am I to do? (2) Can an Urban Council, which does *not* require an ashpit as described in the Model By-laws, insist on the provision of a back passage to dwelling-houses, so that the refuse can be removed, as the By-law stipulates, 'without being carried through any dwelling-house.' An ashpit, of course, by the Public Health Amendment Act, 1890, includes 'any ashtub or other receptacle for the deposit of ashes, fæcal matter, or refuse.'"

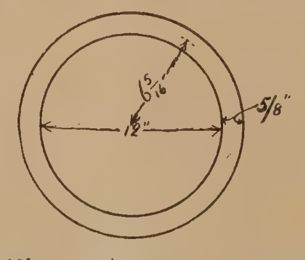
(1) Mr. Croome cannot construct a cesspool on the plot he has purchased. Three courses are open to him, viz.: *(i.)* To acquire—if he can—a site of 50ft., at least, distant from the intended house, and from all other buildings, and the right to make a drain from the boundary of his own premises to it; *(ii.)* to acquire—if he can—the right to make a drain from the boundary of his own premises, over the property of intermediate proprietors, to the sewer. He cannot make such a drain without their consent; but it would seem that he can break up the surface of a highway for this purpose, without the consent of the highway authority; *(iii.)* To call on the sanitary authority to provide him with the means of discharging the sewage from his house, as appears to be contemplated by the 25th Sec. of the Public Health Act (1875), which, where there is no sewer within 100ft. of any part of the site of a new house erected within an urban district, enacts that the sanitary authority shall direct the owner to make the drain, prescribed by that section, from the new house, to empty into some "covered cesspool or other place not under any house." The obligation to provide such a means of discharging sewage has, however, never been judicially declared, and Mr. Croome ought not to take any steps towards building the new house, in reliance upon it, until he has come to an understanding with the sanitary authority.

(2) No. The by-law is conversant with an ashpit that is "constructed," and does not, in my opinion, apply to a case when the refuse is placed temporarily in an ashtub or other loose receptacle. But it is to be remembered that the 35th section of the Act of 1875 requires that every new house shall have an ashpit, furnished with proper doors and coverings. An ashtub, or other movable receptacle, would not, I think, be a compliance with this provision, which the sanitary authority cannot by by-law or otherwise legally dispense with. If then the house is not erected in such a manner as to enable the refuse accumulated in a movable receptacle to be removed without being carried through the house, the sanitary authority can insist on an ashpit proper being constructed, and when it is, insist on compliance with the by-law.
ARTHUR HOUSTON.

PRESSURE OF WATER IN PIPES.

CHELTENHAM.—J. J. writes:—"Will you please give me the solution to the following question, No. 45, Honours Building Construction, Part I., Division I.:—What head of water could a 12in. cast-iron pipe of $\frac{5}{8}$in. metal be exposed to without the stress on the metal exceeding 2,000lb. per square inch?"

Take a ring of 1in. diameter. Then tensional stress on ring = $\frac{5}{8}$in. × 1in. × 2,000 = 1,250lb. Taking moments round centre, 1,250lb. × $6\frac{5}{16}$in.



$= \Pi \times 12\text{in} \times$ water pressure per square inch. Let η = water pressure per square inch. $\Pi = 3{\cdot}14{,}159$. $\eta = \frac{1{,}250 \times 6{\cdot}3{,}125.}{12 \times 514{,}159} = \frac{1{,}350 \times 2}{12}$ (nearly) = 208·3lb. The head of water necessary to give a pressure of 208·3lb. per square inch will be equal to the height of a column of water 1in. square, which will weigh 208·3lb. Head of water $= \dfrac{208{\cdot}3}{\frac{62{\cdot}5}{144}}$ inches $= \frac{208{\cdot}3 \times 144}{62{\cdot}5} = \frac{30{,}000}{62{\cdot}5} = 480\text{in.} = 40\text{ft.}$

MIDDLETON and CARDEN.

Mr. Henry Vaughan, one of the greatest and oldest connoisseurs of art in England, has died.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Great art dwells in all that is beautiful; but false art omits or changes all that is ugly. Great art accepts Nature as she is, but directs the eyes and thoughts to what is most perfect in her; false art saves itself the trouble of direction by removing or altering whatever is objectionable."—RUSKIN.

The Language of Line. THIS, said Mr. Walter Crane recently in Lord Leighton's studio, consists of symbolic, constructive, and graphic expression. Symbolic expression was illustrated by primitive conceptions, such as symbols of the elements; and allusions were made to the Egyptian hieroglyphics, and the extension of the alphabet. Constructive expression was exemplified by reference to the origin of ornament and its use in architecture; also to certain essential linear systems found throughout nature, systems which the constructive, as well as the surface, designer notices. In discussing graphic expression, Mr. Crane pointed out the meaning associated with certain forms and deviations of line, as well as its power in the hands of individual artists of expressing facts of form and textures, in addition to suggesting thought and emotion. A good example of graphic expression used as decoration is found in the frieze, executed in mosaic from designs by Mr. Walter Crane, that runs round the three sides of the famous Arab Hall in Lord Leighton's house.

The Church of the Three Sites. THE Church of St. Bartholomew in Moor Lane, E.C., has passed through many vicissitudes, for, within a period of less than sixty years, it will have stood on three different sites. First of all it was the Church of St. Bartholomew-by-the-Exchange, but was removed about fifty years ago to make way for the Sun Fire Office. Then it was carefully re-erected in a new parish in Moor Lane, but the population has fallen off to such an extent that St. Giles', Cripplegate, will in future do duty for both, and St. Bartholomew's will be removed to the suburbs. Not the least curious thing about this is that all the stones will be numbered so that the surburban church will be exactly the same as the city one, except for its surroundings.

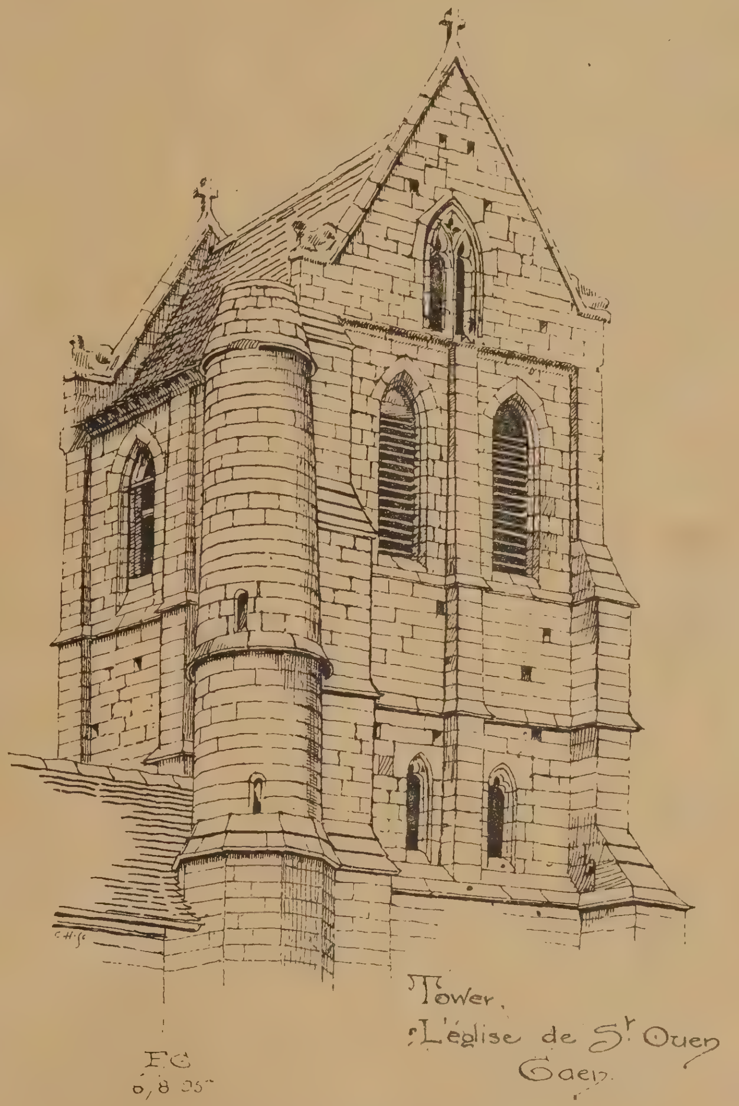
Art in America. MR. STEPHEN D. PEET sings a sad song in the "American Architect" about the future of art and architecture in America. Architects, he thinks, seem to be inclined nowadays to make their profession subordinate to that of the engineer. "The question which they ask first of all is, how can they adapt their art to the new-style building? In other words, the 'skyscraper' has revolutionized the whole system. This looks as if modern civilization was likely to dismiss architecture and religion altogether from society, and subordinate everything to the demands of commerce. The decorating of a steel frame and making a big ornamental box is not architecture. There is a process of differentiation going on which will separate the house architecture from that of the church, the church architecture from that of the public edifice, such as capitols, libraries, halls, institutions of learning, and will also give place to the strange anomaly which is called the 'skyscraper.' The unity of architecture is not likely to appear again. There may be an American style, but it will appear in the home rather than in the commercial building, or even in the public edifice, or in the modern flat." Mr. Peet hopes that this style will supplant the ugly excrescences which have arisen as a result of copying the Old World patterns. Queen Anne style has had its days, as has also the Mansard. Holland and Germany have given about all that we can bear. The American style, probably, will be the outgrowth of the patterns that have been inherited from this country and have been embodied in the old Colonial buildings. The religion of the home was embodied in that style; it may be modified, but cannot be borrowed from France or Italy. Mr. Peet's ideal leads him to conclude his paper with these words: "The American home is the object to which we may well give our best thoughts and make it the place where religion and civilisation shall dwell together." The number of architects who have this high sense of their profession, is, unfortunately, not half so large as one might desire.

Inspiration—and the lack of it. It is given to every man, at one time or another in his life, to do something out of the way, to which rule the sculptor, Carlo Costa, being an ordinary mortal, is, of course, no exception. Twenty years ago King Humbert gave a million lire for the purpose of having a worthy monument erected at Turin to the memory of Victor Emanuel. Carlo Costa was chosen to execute the work, which he promised to complete by 1886; by this date he had gradually received all but 60,000 of the million lire, but the statue was not finished, nor was it ten years later even—in 1896. Such delay was altogether too much for the dignitaries at Turin, and they brought an action against their sculptor. The defence of this ingenuous person was really remarkable. Why did he not go on with the work? For no other reason than that he could not command his inspiration. In the good old days, he said, artists were not expected to furnish works on time, in support of which he mentioned that Leonardo da Vinci had required eighteen years for one of his works and forty years for another. Time, of course, was nothing to the artist. Costa's "fellows of the brush" sided with him in this view, but the authorities were stern, and hard, and practical, with the result that the statue was finished, and was unveiled a few weeks ago. It is said to be a very fine piece of work.

Grand Theatre, Norwich. The Grand Theatre and Opera House, Norwich (shown on one of our inset plates), is being erected in St. Giles, from the plans and specification of Messrs. Ernest Runtz and Co. The front and the covered arcade for foot passengers to the main entrance will be of stone. The main approach is through a spacious crush-room, from which staircases lead to the chief parts of the house. The construction throughout will be of fireproof materials, and the upholstery and decorations will be of an elaborate nature, in all respects equal to the leading West-End theatres. The building will be provided with a complete equipment of fire hydrants and a sprinkler for the fireproof curtain for the proscenium. Heating will be on the low-pressure system, and lighting by electricity. The dressing-room accommodation for the artistes will be excellent, and this block will have an exit direct to the open street, without needing to cross the stage. The building is designed to accommodate over 2,000 persons, and it is expected to be opened to the public before Christmas, 1900.

Our Centre Plates. The drawing shows some of the cottages erected for Mr. R. B. Colvin on his estate at Waltham Abbey to supply convenient and modern homes for the artisans in the neighbourhood. The group of four cottages in the foreground is pleasantly situated alongside the main road, from which they are well set back, thus allowing scope for a front flower garden. They are built with red brick facings to ground floor, the upper story being faced with rough-cast, and the gables constructed of half-timber work; the roofs are covered with plain tiling. In the background is shown a pair of semi-detached cottages. This and similar pairs of cottages have less accommodation than the group of four, and are suitable for small families. They are plainly built, with red-brick facings on ground floor, and rough-cast upper story, with a plain hipped roof covered with pantiles. All the bricks and tiles used in the erection of the houses were made on the estate. The designs are by Mr. F. W. Adams, of Finsbury Circus Buildings, 18, Eldon Street, E.C., the architect to the estate. The house on the same sheet, by Mr. Ernest Newton, is built not far from the moor land at Burley-in-Wharfedale, Yorkshire. The material it is built of is local stone. The building is roofed with stone slabs.

St. Ouen's Church. The only interesting thing about this little church, which is on the outskirts of Caen, is the tower—a striking example of Early French Gothic. The illustration which we give on this page, though very interesting, fails to interpret the charm of the building, not a little of which is due to the holes left by the masons, which may be seen in the sketch. Mr. Frederick Chatterton, of Westminster, is the artist.



DRAWN BY FREDERICK CHATTERTON.

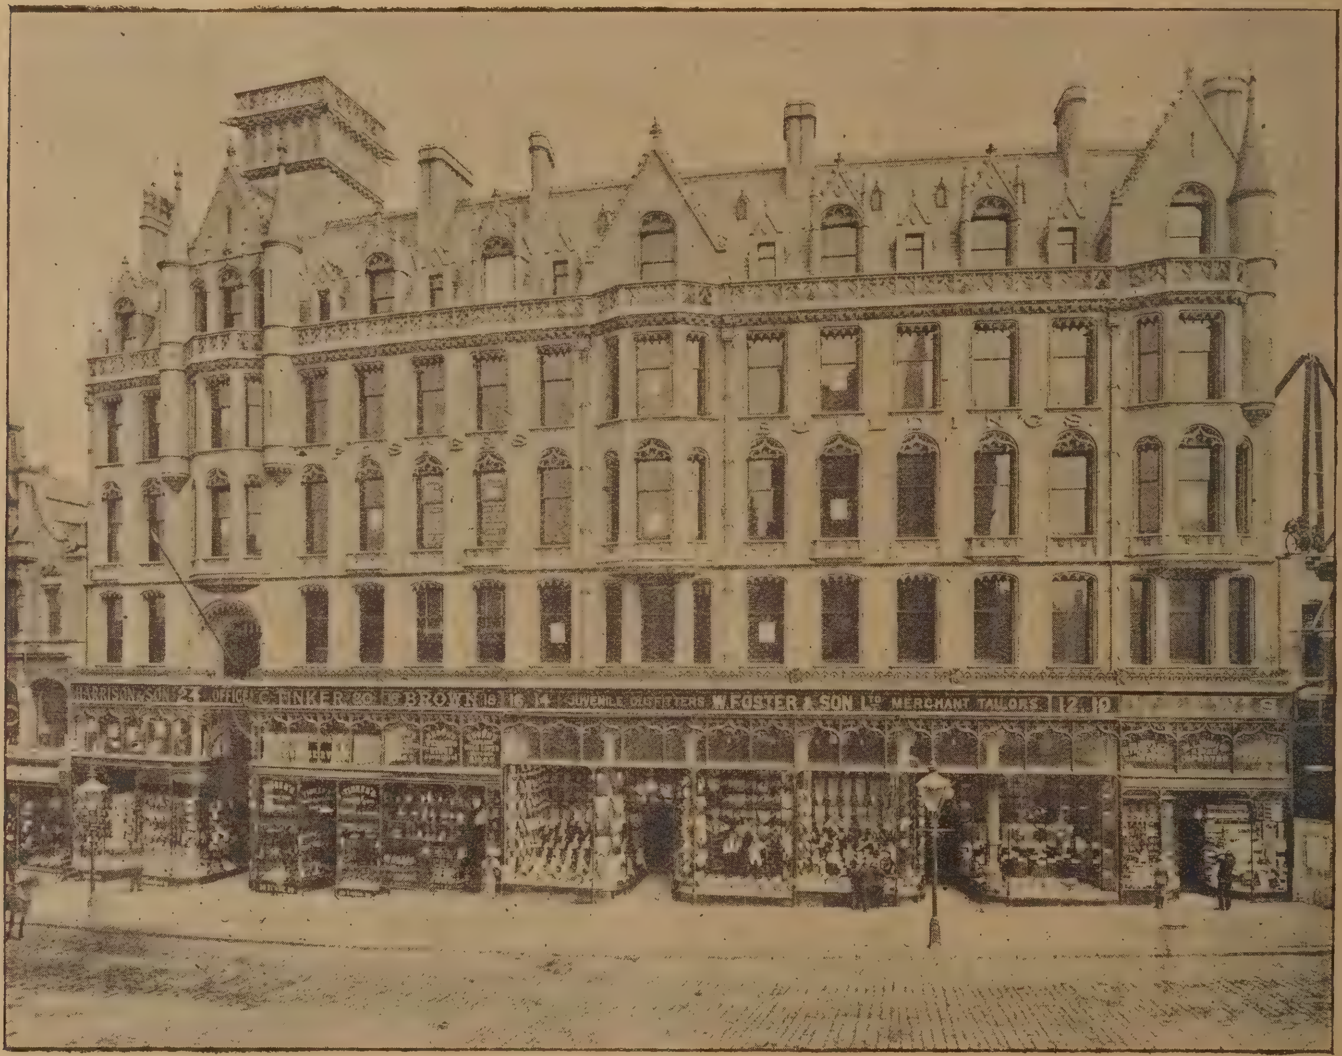
Empire Theatre, Hastings. The Empire Theatre of Varieties at Hastings (see centre plate) has been built from designs by Messrs. Ernest Runtz and Co., of 10, Walbrook, E.C. The site covers a superficial area of 7,860ft., and has a very fine frontage of 131ft. to the Marine Parade, where the main entrance is situated. The entrance hall leads directly into the stalls, whence the circle is reached by a fireproof staircase 5ft. 6in. wide. The pit entrance is approached from the Marine Parade by a spacious right-of-way on the west side of the theatre, while the gallery entrance is at the end of this right-of-way. There are saloons both for pit and stalls and ample lavatory accommodation for both sexes has been particularly provided for. The accommodation in the stalls is for seating 228 persons and in the pit for 176 persons, and the gangways for both parts are thoroughly in accordance with modern regulations. In connection with the circle (which accommodates 201 persons) there is a foyer overlooking the sea, provided with four large windows leading on to a balcony 18ft. above the pavement. This is not only an advantage for ventilating the building in hot weather, but is also an element of safety in case of fire. Balconies, not only in England but all over the Continent, are much favoured in public buildings for this reason. At the rear of the circle is a saloon, raised 4ft. 6in. above the back gangway in order to give a view of the stage. The second tier has a fireproof exit directly on to the Marine Parade, and is connected with an open loggia over the foyer for use during the summer months; this also is an excellent natural means of ventilating the house. Accommodation is provided for 395 persons. The stage is constructed in accordance with modern methods, and electric light has been installed throughout, supplemented by gas. The heating is on the low-pressure system by means of radiators. The building is constructed of good local bricks faced with terra-cotta, and the tiers are made of iron and concrete. The scheme of decoration adopted throughout has been a rich terra-cotta red and old gold treatment for the walls, the box and circle fronts and the ceiling being judiciously gilded on an ivory white ground. The draperies and upholstery are executed respectively in amber satin and velvet, and the Wilton Pile Carpeting throughout is of natural green. The act drop has been painted by that well-known scenic artist Mr. W. T. Hemsley to harmonise with the draperies. One of the features of the decorative scheme is the coffered arch springing from the boxes and forming not only a decorative but a constructional feature of the theatre. It should also greatly assist the acoustic properties of the building. Over the proscenium opening is a freize (in connection with which the architect has received valuable assistance from Mr. Charles Buchel) giving an allegorical treatment of the rising of Venus from the Waters, and for vigour of conception and refined treatment it is highly commendable. Semi-circular decorative panels, representing the seasons, are placed over the boxes; these are very pleasing. Mr. Peter Jenkins, of Grosvenor Works, St. Leonards, was the general contractor.

Professional Practice.

Aberdeen. — The new Beechgrove Free Church, erected from the designs of Messrs. Brown and Watt, is now nearing completion. Light Kemnay granite is the stone employed, and the style of architecture is a phase of Early English, with Scotch features, the effect of the combination being to give an impression of refinement and strength. One of the principal features is the spire, which is to be 175ft. high. The chief entrance is at the foot of the tower in the north-west corner, the result of this arrangement being to allow the gable front of the church to be pierced by an elegant triple-light window, with heavy moulded mullions, rich sills, and pointed tops, which will show effectively in the finely-dressed Kemnay stone. A more utilitarian result of placing the doorway in the tower is to prevent draughts in the interior of the church. Besides the main entrance, a secondary entrance is provided from Beechgrove Avenue in a porch thrown out at the south-western corner. Beneath the main window is a line of dwarf triple-lights, corresponding in width to the large window above. The gable is crowned at a height of 60ft. from the ground with a neat granite final—hardly a cross, yet faintly suggestive of one. The hall is situated in the rear of the church, running north and south; and in this part also are provided the session house, vestries, ladies' room, strong room—for communion plate—lavatories, and other suitable accommodation. Inside there is a series of arches between the nave and the aisles, built of rich red freestone and rising from massive pillars of polished pink granite. The total cost of the church is estimated at £9,000.

London.—On Monday last a private view was given of the new extension and additions to the National Gallery of British Art (Tate Gallery) at Pimlico, which have been carried out from the designs of Mr. Sidney Smith, F.R.I.B.A. The new extension occupies about the same extent of ground as the earlier building, but of course the main architectural features, the handsome portico and the vestibule, &c., have not been repeated, and the whole ground has been available for galleries, of which the new building includes nine, in addition to a studio and restoring room. The new portion affords more wall space than the building now open, and it has also a very fine central sculpture hall. The original building was wired throughout for electric lighting, but when the Trustees took it over they determined that there was some risk involved in artificial illumination of any kind, and it thus unfortunately happens that when the weather is dull or foggy the place has to be closed. As this has been the decision of the Trustees with regard to the original galleries, it has not been thought worth while to provide for lighting the new ones. It may be mentioned that the Tate Gallery has more wall space than the National Gallery or the Royal Academy, and, altogether, has cost something like £150,000. Artistic visitors will be glad to hear that the Watts pictures will be brought together into one well-lighted room in the new building.

Loughborough.—On December 13th next Viscount Cross will open the new Conservative Club that has been built in Baxter Gate from Mr. W. T. Hampton's designs. Messrs. T. Barker and Son were the contractors. Red pressed bricks and Derbyshire stone dressings have been used for the front, which has been set back about a yard from the old building line. The entrance vestibule has the walls covered with glazed tiles, and a mosaic floor, and the entrancehall is fitted up with a pitch pine staircase leading to the reading-room, which is on the first floor. Owing to the limited width of the site, considerable difficulty was experienced in arranging the rooms, but this has been successfully met by arranging the principal rooms with a corridor along one side. A commodious smoking-room 20ft. square and 12½ft. high has been provided. The vitiated air is drawn from all rooms by means of air shafts, at the upper end of which is placed a Bunsen gas-burner to create an upward current in the shaft, at the same time creating an inrush of fresh air at the various tube inlets. The billiard-room,



FOSTER'S BUILDING, SHEFFIELD. FLOCKTON, GIBBS, AND FLOCKTON, ARCHITECTS.

which is light and spacious, is 39ft. by 25ft., and has elevated seats upholstered in red leather, the floor being of wood blocks; the room will accommodate two tables. Beyond the billiard-room is a card-room, 20ft. by 16ft. By means of moveable partitions a room 86ft. by 22ft., and capable of accommodating 400 to 500 persons, can be formed.

Sheffield.—Foster's Buildings stand at the head of High Street, which is one of the best shop centres of the city. They had to be designed to meet the requirements of the tenants, and to satisfy all their wishes, as they were leaseholders of the old property which was pulled down. The shops are very varied in size, being from 57ft. wide by 100ft. deep to 13ft. wide by 31ft. deep. The upper storeys are used as offices, the entrance to which is arched, with a tower above. The tower was intended to contain a cistern for a hydraulic elevator, but a high pressure cistern has been substituted. The offices are well lighted back and front, and are approached by corridors 8ft. wide. The design is in the French Gothic style, but owing to the demand of the tenants for plate-glass windows upon which they can put their names the mullions had to be omitted, which altered the character; in fact, it is the reverse of the fashionable style, being somewhat classical in its general conception, with Gothic details, instead of being Gothic in its general conception with classical details. Unfortunately the building faces north, and seldom gets the sun upon it. The Gothic details have in this situation the advantage over the classical. The architects are Messrs. Flockton, Gibbs and Flockton.

Views and Reviews.

ARTS AND CRAFTS ESSAYS.

To those who are not artists, and yet wish to have things as they should be, the volume of essays by members of the Arts and Crafts Exhibition Society can be recommended with only some slight reservations. If some of the essays are compact to a fault, it is because they formed parts of the catalogues of the Society's first exhibition, where excursions beyond the narrowest limits were not to be thought of. It must be remembered, moreover, that some of the best writers were also the busiest artists, and could not have done more except for a consideration of which nothing was said, I suppose. There is enough in the facts to account for the "classical parsimony" with which they dispense their favours. We wish that the best had been longer, and wishing is praising here.

The writers set forth very clearly the principles by which they are guided, and do something more than suggest what should and should not be attempted. In the saying that "The cobbler should stick to his last" (which should be easy with wax at hand) lies the gist of it all. "I maintain that the true end of an art is that which it and no other is fit for." The author of this egregious and obvious platitude was no better furnished by nature than his great contemporary Johnson, and no better able on the evidence of dulled senses to demonstrate the emotional value and significance of the works which he took as his subject.

Now Lessing, if not actually colour blind, knew nothing, at any rate, of our delight in considered effects of colour; as for music, it simply annoyed him. Yet this same man, removed from ourselves by a vast, became possessed of an idea which critics have found invaluable, and the "Laocoon," in which he expressed it, will retain its place for all time as the work of a master mind. His enquiry was limited, the reader must know, to a comparative study of the sculptors' art and the poets', supposing a subject common to both, and assigning to each his domain. The method once mastered admits of being extended to art works of all kinds, including literary ventures of course, and we may proceed thereupon to consider what each in its turn is fit for. A book which set Goethe thinking may be said to have set the world thinking, and I, for my part, owe all I am worth to this essay.

For convenience of thought and reference, the subjects most closely allied to architecture are treated in sequence here, while the next of kin hug one another in other parts of the volume, and the collection, as a whole, is less miscellaneous than it appears at first sight. The cement is in the idea, and that, as was said, is a good one. In so far as it treats of technical matters it is rather to be shelved for reference than nursed like the newly born. The "purple patches" of truly felicitous phrasing are few as might be supposed, but most welcome when they appear, as in Mr. Lethaby's essays for instance. In that on "cast-iron" he speaks of Ruskin's "fearless use of paradox striking one into thought." The phrase "meanders of vine," whether his or another's, is very delightful, and happy indeed is his preference for "substantial and bounding form" in "objects cast in the round." The literary craft has the most obstinate laws of all, and if this is to be brought into line with the rest as in the Art Workers' Masque, they cannot be too assiduously studied. E. R.

Essays by Members of the Arts and Crafts Exhibition Society. Messrs. Longmans, Green and Co. 2s. 6d.

ORNAMENT AND ARCHITECTURE.

Mr. Glazier states in his preface that this manual has been prepared with the three-fold object of giving an elementary knowledge of architecture and historic ornament, of awakening a responsive and sympathetic feeling for the many beautiful and interesting remains of ancient and mediæval civilisation, and, lastly, of directing the attention of students and craftsmen to the beauty, suggestiveness, and vitality of the industrial arts of the past, and their intimate relation to the social and religious life of the people.

This book runs to 136 pages, and consists of a number of short chapters, each of which deals, in an elementary fashion, with the characteristic forms of the various styles of architectural ornament—such as Roman ornament, Scandinavian ornament, Persian ornament, &c.—and then with the different forms of what are called industrial arts, such as textiles, mosaics, glass, pottery, &c. The whole is illustrated with 470 drawings by the author, either in plates or mixed with the text, and the general get-up of the book—the paper, printing, and binding—is admirable.

It is always a little difficult to know how to take books like this, how to place them, on what lines to judge them, how to determine their real value and intent. The author on his title page says that it treats of "the evolution, tradition, and development of architecture and other applied arts," and is "prepared for the use of students and craftsmen."

In the first place, architecture is not an applied art. It is the art of building—that is, it is a structural art, the art of construction. One cannot protest too often against the idea that architecture consists of applying decoration to a structure that was not architecture before it was so treated. The structure itself is the architecture, when there is any in the case.

If, however, this term "applied art" simply means art applied to a useful purpose, then it is a term which could be used equally for all forms of art, all of which serve a useful purpose, otherwise they would not exist. But apart from this, which may merely be an inaccuracy of expression, this description leads us to expect much—much more than we find. Evolution is a big word, it means a big thing. The evolution of architecture is something apart from ornament; it depends on matters that lie deeper than surface decoration; it is hardly to be adequately handled in a manual of historic ornament. The same thing is true of tradition and development. It seems to us that where this book confines itself to the *rôle* of a manual of historic ornament it may serve a useful purpose. It gives clear and definite illustrations, which admirably suggest the general forms and construction of the different types, with information in the letterpress of much value as regards matters of fact; but when it attempts to go further, and to deal in general historical deductions, or to generalise in matters of theory, it seems inadequate and superficial. To say that the Gothic shows "no traditions beyond Sicilian or Arabian influence" is to express less than the whole truth. To tell us that "when the Emperor Constantine removed the seat of government from Rome to Byzantine (*sic*), in the year A.D. 330, he inaugurated a new era in art, viz., the Byzantine," is not giving us the gist of the matter. It almost suggests there was an Imperial edict, "Let there be a new era in art," and it was so.

We notice, also, short chapters devoted to a general description of the architecture of different periods. In these we find included much information which, though doubtless it has its own value, is yet hardly germane to the matter in hand, and is inserted to the prejudice of much that is vital. For instance, in the chapter on Greek architecture, which takes up altogether less than three pages, more than half a page is occupied by a classification of temples—apteral, dipteral, distyle, tetrastyle, &c.—and by a table giving the relative heights, in parts of the diameter, of the entablatures of some typical Greek buildings. Surely the author, in giving such a brief sketch, could have found something more vital to say than this. These facts are interesting enough, but principally to the archæologist; they have but a remote bearing on historic ornament. The same tendency is noticeable in the chapters on Roman and Gothic architecture. We think the more valuable part of the book is that which deals with the industrial arts. A. R. J.

"A Manual of Historic Ornament." By Richard Glazier. B. T. Batsford, 94, High Holborn, W.C. 5s. net.

New Patents.

These patents are open to opposition until January 1st.

1898.—Refuse Destructors.—24,582. J. WILLOUGHBY, Plymouth. To enable the refuse to be more easily fed to the destructor, it is tipped from the carts on to a turntable, which may be flush with the floor or platform, and is provided with any suitable locking device. This turntable is adjacent to the destructor.

Finishing Sanitary Pipes. — 24,957. J. R. W. WOODWARD, Ashby Woulds, and N. COLLIER, Woodville. After being removed from the machine the pipe is placed on a perforated floor, and is there partly dried by a heat applied from below. It is now placed in a kind of lathe, where it is straightened on a mandrel, trued up, and scratched by suitable tools. A frame of wires is used for cutting off. The burning is as usual.

Cranes and Excavating Apparatus.—25,384. T. WHITTAKER, Horsforth, Leeds. Instead of turning the crane by cog-wheels or gear, plain pulleys wound over with steel rope are employed. One is at the foot of the crane mast, and the other is on the slewing motion shaft. A spring buffer is provided where the joint in the rope occurs. This invention is intended to reduce the strain on the crane.

Centrifugal Pumps.—25,988. J. GWYNNE and E. W. SARGEANT; both of London. Combined with the pump is an ejector that is operated by a jet of water supplied by a supplementary pump. This arrangement is claimed to be more convenient than that in which steam is used to start the pump.

Crane Hooks.—26,923. D. T. YOUNG and H. W. YOUNG, Birmingham. To increase the strength, the hooks, when hot, are made into girder-like section around the bend, where the greatest strain occurs.

1899.—Artificial Wood and Stone.—10,798. J. A. WHEELER and S. W. EELLS; both of America. Fibrous pulp (for fireproofing asbestos fibre is used) is mixed in equal quantity with ashes or talc, or both; water is added, and when thus in a plastic state, silicate of soda or potash is put in. When exposed to air and heat the material becomes as hard as stone, and the moulded article can be further hardened by giving it a coat of chloride of magnesia solution. Pulverized resins are added when wood pulp is used.

Glazing.—11,208. J. R. Scholefield, Liversedge. The supporting bar is grooved to carry off condensation, and in one of the grooves is a rubber strip on which the glass seats, being held in place by metallic caps secured with screws. The caps are also grooved to receive a rubber cushion, and are formed so as to allow for expansion and contraction of the glass. No putty is used.

Sewer Ventilators.—17,049. E. R. Palmer, Beckenham. A positive up-draught is created in sewer ventilating shafts by inside fans, propelled, preferably, by water from the main. Where the sewers are periodically flushed from automatic flushing tanks, the waste water from the motors may be taken into the tanks for filling them. Means are provided to prevent down-draught.

Window Blinds.—17,067. S. Buchner and N. Samet; both of Austria. The curtain is attached to one or more sets of lazy-tong levers arranged at the top, or top and bottom, of the window. They are operated by a handle and lever, which thus makes the opening and closing of the blind easy.

The following specifications were published on Saturday last, and are open to opposition until January 8th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—20,712, Wadsworth, street cleansing machines. 23,305, Shone and Ault, apparatus for raising sewage and other liquids by direct air pressure. 26,466, Fyfe, water closets. 27,030, Shanks, apparatus for distributing enamel powders, &c.

1899.—71, Haddan (*Schuppmann*), stoves for warming purposes. 172, Fawcett, presses for pressing sand-faced and other bricks. 1,264, Kirk, traps for gullies for roads, streets, yards and stables. 2,152, Isles, Ltd., and Tempest, combined pile driver and crane. 5,337, Cole, fire grates. 17,787, Lake (*McCloskey and Scully*), machines for making wire fencing. 17,979, Ascoli, nails. 18,517, Nesemann, windows. 18,835, Boult (*Gebler*), apparatus for use in breaking up roads, &c. 18,959, Household and Ardley, traps for closets, urinals, lavatory basins, ventilation pipes, &c. 19,407, Moran, waterworks systems. 19,411, Ives, method of and apparatus for the treatment of sewage and similar liquids. 19,607, Savery, facing brick. 19,697, North, guard for circular saws.

Grimsby Workhouse is to be extended. The estimated cost of the work is £6,200.

Back Numbers of the "Builders' Journal."—The publisher will be glad to receive from readers, any copies which they may be able to spare of the following numbers of the Builders' Journal:—Nos. 1, 3, 5, 6, 27, and 35. In exchange, he will be pleased to send a copy of the current number of The Architectural Review.

Leonardo da Vinci's famous picture, the "Last Supper," is reported by a Milan correspondent to be fast covering with a layer of greyish mould, so that great portions of it are quite indistinguishable. A commission of experts has been called to examine this great work of art to see whether anything can be safely attempted to preserve it.

The Hotel Russell, in Russell Square, W., a huge structure in red brick and terra-cotta, has been built from the designs of Mr. C. Fitzroy Doll, and will accommodate 500 visitors. It covers an area of more than three-quarters of an acre, and is nine storeys high, with a lofty dome and minarets. On the principal frontages are shields in glazed coloured pottery containing the arms of many nations, while there is an observatory on the tower in Guildford Street. Over the principal entrance in Russell Square are four terra-cotta statues of Mary, Elizabeth, Anne and Victoria.

Keystones.

A Sailors' Home at Chatham is to be built at an estimated cost of £15,000.

New barracks at Colchester, to be named the "Gujerat," are to be built by the Government.

St. George's Church, Balbriggan, Co. Dublin, has had its tower repaired, a new pulpit provided, and new pews.

Some interesting interiors of Arundel Castle, Sussex, are given in the "South Coast Quarterly" for November.

Memorial windows to the memory of the late Canon Allen have been placed in the Porthkerry and Barry parish churches.

Forty sites for new Board schools, or for enlarging existing ones, are proposed to be acquired by the London School Board.

Horton Asylum, Epsom, for which the L.C.C. authorised an expenditure of £350,000 in 1896, has been found to cost £456,130.

A consumption hospital at Liverpool is to be built from designs by Messrs. Willink and Thicknesse.

A new Liberal Club at Farsley has been built, at a cost of £3000, from designs by Mr. W. D. Gill, of Stanningley.

A new statue at St. Peter's, Rome, of St. Peter Fourrier, of Alsace, has just been erected. It was chiselled from a block of marble weighing forty tons.

The Leicester Society of Artists are at present holding their seventeenth annual exhibition of pictures at the museum buildings. The exhibition will remain open until January 13th.

Messrs. S. B. Bolas and Co., 77, Oxford Street, W., are the authors of the photographs of Scott's Restaurant, the "Rising Sun," and the "Old Shades," which appeared in our "Men Who Build" article last week.

A new Wesleyan church at Weston-super-Mare is being built in Station Road, at a cost of about £5,600, from designs by Mr. W. J. Morley, F.R.I.B.A., of Bradford—selected in competition.

A Roman Bath has been discovered in connection with excavations at Valle Crusis Abbey, Llangollen. An ancient Celtic cross and a tombstone of the twelfth century have also been found.

Change of Address.—The office address of Mr. Lewis Angell, C.E., late engineer and architect to the County Borough of West Ham, is now: Westminster Chambers, 11, Victoria Street, S.W.

The new "Old Bell" on Holborn has been built from Mr. Arthur Dixon's designs. Red polished granite has been used for the lower, and Portland stone for the upper part of the building.

"The Round Towers of Ireland" was the title of a paper read by Mr. Anthony Scott last week, before a meeting of the Architectural Association of Ireland, the president, Mr. G. Sheridan, being in the chair.

The Lakes of Killarney were put up for sale on Tuesday in last week, but as the highest bid only reached £50,000 the property was bought in. On Saturday last, however, the estate was sold by private treaty to Lord Ardilaun for £60,000.

A Lady Sculptor Wins.—A young lady named Mynssen has won the first prize for sculpture in an exhibition in Holland. According to the judges, her statue, representing Spring, is one of the best pieces of work produced latterly.

Housing the Poor.—In New York, next month, an exhibition will be held which will chiefly consist of models of existing tenements, both in America and elsewhere. It is proposed to send some of the exhibits to the Paris Exhibition.

New Companies.

City Land Syndicate, Limited.

This company was registered on November 15th by Waterlow and Sons, Limited, London Wall, E.C., with a capital of £15,000 in £10 shares, to acquire and traffic in land, houses, and other property in the city and county of Kingston-upon-Hull or elsewhere, and to carry on the business of decorators, lime, timber, and hardware merchants, &c. The directors (to number not less than three nor more than six) are George T. Butterworth, Edward Goddard, George L. Shackles, William S. Sharp, and Arthur J. Windross. Qualification, £500. Remuneration, £100, divisible, for the first year; afterwards as fixed by the company.

Woolpit Brick Company, Limited.

This company was registered on November 4th by G. H. Daniell, 4, Great Winchester Street, E.C., with a capital of £80,000 in £1 shares, to acquire, by purchase or otherwise, the Woolpit Estate, Suffolk, and the business carried on under the style or firm of the Woolpit Brick Works Company, Limited, to adopt and carry into effect an agreement expressed to be made between the proprietors of the Woolpit Estate and this company, and, generally, to carry on in all or any of their respective branches the businesses of manufacturers of and dealers in bricks, tiles, pipes, terra-cotta goods, pottery, earthenware, enamelled and glazed goods, sanitary ware, sanitary appliances, &c.; as lime burners, &c. The first directors (of whom there shall be not less than three nor more than five) are to be elected by the signatories. Qualification, £250. Remuneration, £100 per annum each (chairman, £200).

West London Property Corporation, Ltd.

This company was registered on November 2nd, by Woodcock and Co., 15, Bloomsbury Square, W.C., with a capital of £150,000 in £1 shares (100,000 of which are preference shares and 50,000 ordinary), to adopt and carry into effect an agreement to be made between H. P. Lowe and C. F. Quin and this company; to acquire, deal with, work, and turn to account any real, leasehold, or personal property, and to sell, let, lease, exchange, mortgage, charge, enfranchise, and dispose of the same; to develop the resources of such land, estates, &c.; as builders and contractors, house and estate agents, decorators, merchants of and dealers in stone, sand, lime, bricks, tiles, timber, hardware of all kinds, terra-cotta and other building requisites, &c. The first directors (of whom there shall be not less than two nor more than five) are Sir J. T. Brunner, Hon. J. S. Montagu, H. P. Lowe, C. F. Quin, and E. N. Paton. Qualification, £100. Remuneration to be fixed by the company.

Marble Hill Syndicate, Limited.

This company was registered on November 6th by Minet, Pering, Smith and Co., 81, Cannon Street, E.C., with a capital of £20,100 in 200 ordinary shares of £100 each 1,000 founders' shares of 2s. each, to acquire and turn to account any buildings and lands, and to carry on the businesses of builders, decorators, brick, timber, and hardware merchants, &c. Registered without articles of association. Registered office, 81, Cannon Street, E.C.

Ashford Manor Estate and Golf Clu
Company, Limited.

This company was registered on Novembe 16th by G. B. W. Digby, 2, Coleman Street E.C., with a capital of £5700 in 500 five pe cent. cumulative preference shares of £10 eac and 700 deferred shares of £1 each, to acquir the Ashford Manor Estate at Ashford, Middlesex, to adopt an agreement with the Genera Contract Company, Limited, and to carry o the business of builders, brick, timber, an hardware merchants, &c. The first director (to number not less than two nor more tha seven) are to be appointed by the subscriber Remuneration as fixed by the company.

Friday, December 8.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. D. Bennett Dobson on "Graphic Calculations." 8 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. C. R. Ashbee on "The Co-operative System among the Mediæval Builders in England." 6.45 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Ordinary meeting. Nominations for annual election of officers. 8 p.m.

Saturday, December 9.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—(Newcastle-upon-Tyne.)—Council meeting at 1 p.m. General meeting at 2 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

GREENWICH.—Accepted for pulling down and rebuilding the back additions of 80, and 82, Greenwich-road, S.E., and carrying out certain drainage work in connection therewith, for Mrs. M. A. Chalk, Caterham, Surrey. Mr. J. Halsted Waterworth, architect and surveyor, 281A, Queen's-road, New Cross Gate, S.E.:—

S. R. Best, Brockley, S.E.	£252 10

LONDON.—For works at "The Prince Alfred," Canning Town, E. Messrs. Foulsham and Herbert Riches, architects, Bromley-by-Bow and 3, Crooked-lane, King William-street, E.C.:—

A. Webb	£345 0	T. H. Jackson*	£316 10
Osborn and Sons ...	321 0	Sheffield Bros.	315 0

* Accepted.

LONDON.—For works to cottage, boundary wall, &c., Clyde-place, Leyton, E. Messrs. Foulsham and Herbert Riches, Bromley-by-Bow and 3, Crooked-lane, King William-street, E.C.:—

Osborn and Sons ...	£219 0	P. Hart	£200 0
E. F. & T. S. Walker	204 8	A. Webb (accepted)...	174 17

LONDON.—For erecting saw mills, stables, and foreman's cottage at Albert Wharf, Wandsworth Bridge, for Mr. E. H. Johnson. Mr. J. A. J. Keynes, architect, 5, Gledhow-terrace, South Kensington:—

Minter	£5,320	Kearley	£4,932
Turtle and Appleton ...	4,966	Hammond (accepted)	4,554
Holdstock and Mould	4,940		

LYME REGIS (Dorset).—For the construction of sewers, Cobb district, for the Town Council. Messrs. Witts and Phillott, engineers, Cheltenham. Quantities by engineers:—

J. Jones	£1,813	S. Ambrose, Bath* ...	£1,646

*Accepted.

NEW CROSS AND GREENWICH.—For sundry repairs and decorative work to property at New Cross and Greenwich, on Martin Estate. Mr. J. Halsted Waterworth, surveyor to the estate, 281A, Queen's-road, New Cross Gate, S.E.:—

S. R. Best	£196 18	W. Falkner	167 15
W. H. Smith	181 4	A. R. Burge	133 0

ROMILEY.—For alterations and additions to the Grey Horse Inn, for Messrs. Gartsides, Ltd., Brookside Brewery, Ashton-under-Lyne. Messrs. J. H. Burton and J. A. Percival, architects, 150A, Stamford-street, Ashton-under-Lyne:—

T. Rhodes	£795 0	Wellerman Bros. ...	£720 4
Williamson Bros. ...	780 0	E. Holmes, Dukinfield*	711 0
Edwin Marshall ...	737 0	T. Moore and Son ...	700 0
G. Pike and Son ...	733 18		

*Accepted.

CONTRACTS OPEN.

TO BUILDERS.

The Commissioners of H. M. Works and Public Buildings are prepared to receive TENDERS for the FOUNDATIONS and certain works connected therewith, of the Royal College of Science, South Kensington.

Drawings and Specifications which have been prepared by Mr. ASTON WEBB, A.R.A., together with a copy of the conditions and Form of Contract, may be seen on application to Sir JOHN TAYLOR, K.C.B., at the Office of Works.

Bills of quantities have been prepared for the use of Builders by Messrs. CORDEROY, SELBY, and CORDEROY, of 21, Queen Anne's-gate, and Messrs. FOWLER and HUGMAN, of 9, Craig-court, and, together with forms of Tender, may be obtained at the Office of Works on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon, on Friday, DECEMBER 15th, next, addressed to The Secretary, H.M. Office of Works, &c., Storey's-gate, London, S.W., and endorsed "Tender for Foundations &c., Royal College of Science."

H.M. Office of Works, &c.
November, 1899.

THE ISLE of THANET JOINT HOSPITAL BOARD.

ERECTION OF INFECTIOUS DISEASES HOSPITAL.

TO CONTRACTORS.

The Isle of Thanet Joint Hospital Board are prepared to receive TENDERS for the ERECTION of an INFECTIOUS DISEASES Hospital for their district.

Those desirous of Tendering can inspect the drawings and specifications at the office of the Joint Architects, Messrs, LANGHAM and OSBORNE, 70, High-street, Ramsgate, between the hours of TEN a.m. and FOUR p.m., any day (excepting Saturday).

The quantities, conditions of contract, and forms of Tender can be obtained from the Surveyors, Messrs. FRANKLIN and ANDREWS, No. 25, Ludgate-hill, E.C., upon payment of a fee of Ten Guineas, which will be returned on receipt of a bonâ fide Tender.

Sealed Tenders, to be signed and endorsed "Tender for Infectious Diseases Hospital for the Isle of Thanet Joint Hospital District," are to be delivered or posted to my office, on or before DECEMBER 18th next.

Any Tender not on the prescribed form will not be considered.

The Board do not bind themselves to accept the lowest or any other Tender.

A. BROMLEY BURROWS, Solicitor,
Clerk to the said Board.
No. 72, High-street, Ramsgate,
November, 1899.

HORSHAM SCHOOL BOARD.

TENDERS are invited for the ERECTION of a SCHOOL at Victory-road for the Horsham School Board.

Plans and specifications may be seen at the Offices of the Architect, Mr. WILLIAM BUCK, North-street, Horsham, between the hours of TEN o'clock a.m. and FIVE o'clock p.m.

Bills of quantities will be supplied on payment of a deposit of One Guinea, which will be returned upon the receipt of a bonâ-fide Tender for the works.

Sealed Tenders must be delivered to the undersigned not later than TWELVE o'clock, on MONDAY, DECEMBER 4th, 1899.

The Board do not bind themselves to accept the lowest or any Tender.

FREDK. W. BUTLER, Esq.
West-street, Horsham, Clerk to the School Board.
November, 1899.

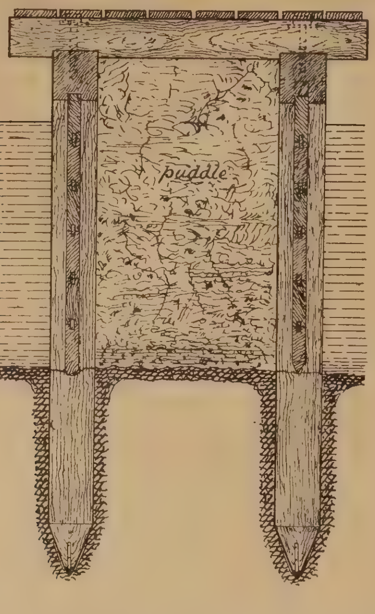

FIG. 1.—TRANSVERSE SECTION OF A SMALL DAM.

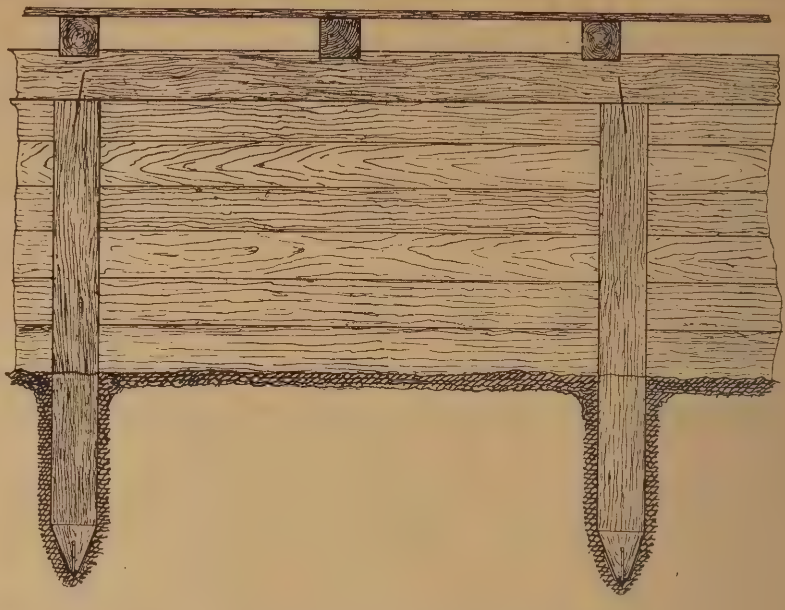

FIG. 2.—LONGITUDINAL SECTION OF A SMALL DAM.

THE CONSTRUCTION OF COFFER-DAMS AND CAISSONS.

BY GEORGE ELLIS.

COFFER-DAMS are water-tight walls of timber and clay used for the purpose of excluding water from the site of foundations, bridge piers, embankment walls, &c., during their building. They are formed by driving two or more parallel rows of timber piles at various distances apart, proportionate to the pressure of water around the proposed site, and filling the space enclosed between the rows with a mass of puddle, that is, well kneaded and rammed clay. When the dam is completed the space enclosed is pumped dry, and the bottom levelled and solidified, either by ramming or concreting, after which the foundations are made and the superstructure carried up. The details in the construction of dams vary somewhat, according to circumstances and the ideas of different engineers, but the main arrangements are the same in all, and are clearly shown in the accompanying illustrations. One of the chief difficulties to overcome is the tendency of the puddle to burst out the sides of the dam on account of its swelling, this being caused by the infiltration of the water, aided by the latter's varying resistence as it rises and falls. At first sight it would seem an easy matter to counteract this by transverse ties and struts, but it is found in practice that all such interior timbering is a source of weakness in the dam, inducing leakage and forming conduits for the water into the enclosure, in consequence of the impossibility of getting the clay well punned beneath them. To a lesser extent this danger is also present when iron tie-rods are used, and precautions have to be taken to prevent it; but as these rods are easily applied and more effective than timber, they are most frequently used below the water level. Where possible, they should not be taken right through the dam continuously, but stopped upon one of the inner walls, as shown in Fig. 3; the heads of the bolts and the nuts should seat on large iron washers, with pieces of vulcanised rubber or greased leather interposed between them and the timber blocks which take the bearing. Figs. 1 and 2 are illustrations of a small dam, suitable for use in a shallow river. It consists of two series of piles, 10in. by 10in., connected by long heads of similar timber, into which the piles are either notched or tenoned and secured by timber dogs. The two walls are tied together by crossheads of 9in. by 9in., notched over the longheads and fixed to them by screw bolts; these are surmounted by a floor of 3in. deals, affording a convenient platform from which to shoot the puddle and subsequently to receive the material for the foundations. The piles are spaced about 9ft. apart, and the voids between them filled in with horizontal sheeting, consisting of 3in. by 9in. deals with their edges either grooved to receive tongues or cut to a bird's-mouth and V-section. This sheeting is secured at each end by inserting it in grooves cut in the sides of the piles, or, where the latter are of small scantling, in grooves formed by bolting two streaks on the face of the pile; both these methods are as shown in Fig. 4. The first board dropped in has its lower edge bevelled off to a sharp arris, and when it reaches the bottom is knocked hard down with pieces of timber until its sharpened edge is bruised into the irregularities of the bottom. It is then removed by means of hooks; the indented parts are cut away until the edge roughly fits the bottom, and it is then sent down again, this time with a tongue in its upper edge. The remaining sheets are then entered successively in the grooves and knocked hard down until they reach about an inch above the shoulders of the piles, this part entering a groove in the long heads. Temporary strings are nailed to the sides of the piles near their heads during this operation to keep them in place until a sufficient number of bays, to be covered by a length of heading, are filled in, after which the latter is fixed and the strings removed.

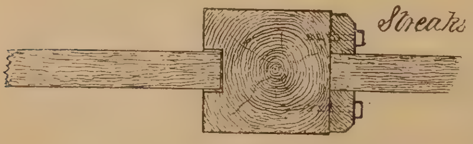

FIG. 4.—DETAIL OF PILE IN FIG. 2.

Fig. 3 is a perspective view of a portion of a large coffer-dam (the puddle being omitted to show the construction), such as would be required in deep waterways, where there is considerable difference between the levels of the tides. It consists of four rows of whole timber piles, 12in. by 12in., tied together with pairs of half-timber walings (W) 12in. by 6in. and connected by transverse tie-bolts. The walls are arranged at 5ft., 6ft. and 8ft. apart respectively, and are driven 9ft. below the river bed. The centre of the dam is carried up 3ft. above high-water level, and the body 4ft. above low-water level. The centre is supported from the rear by inclined and horizontal struts, either from the embankment or the opposite wall of the dam. This construction is commenced by driving guide piles, about 12ft. apart, in true alignment and in vertical planes, around the site, then bolting on the walings W. at the head and just above the lowest water-level; between these the intermediate or sheet piles are driven, being all sawn straight on their contiguous faces, laid together, fitted and marked, and inserted in corresponding order, so that they shall form tight joints. The last pair in each bay to be driven, which should be the middle pair, are cut tapering in opposite directions, so that they shall spread out in driving, and wedge all the others up closely. After the piles are all driven, and before the puddle is shot, all the walings on the insides of each dam that can be dispensed with are removed; these are indicated in Fig. 3 by being unshaded. The remainder below low-water level have their under edges adzed off to facilitate punning. Should the enclosed site be extensive, it might be found difficult to get adequate support for the raking shores, and in such a case counterforts, or transverse walls of piles, would have to be driven across the interior of the dam and braces taken from these horizontally to strut the intermediate portions.

It is usual to make the total width of a dam equal to the mean depth of the water up to 10ft., and for greater depth than this to add 4in. to the width of the dam for each additional foot of water. The length of the piles will depend upon the nature of the ground and the height of the dam above high water; generally, where there is a sound bottom, one third of the greatest depth of water will be a sufficient depth to drive the piles below the bed. A sluice should be formed in all dams in tidal ways to provide against a sudden rise in the water, which may necessitate the flooding of the enclosure to prevent the dam being washed away. These sluices are square conduits made of planking running through the dam at low-water level and closed at one or both ends by sliding shutters. Provision is made for them by driving two pairs of grooved piles, about 2ft. apart in the clear, on opposite sides of the dam near its middle; these are the guides in which the gates work. Two filling piles are driven tightly between them to the low-water level and their heads cut off level and grooved out 2in. deep, an auger hole having been previously bored through each to facilitate the operation. The sluice is next formed of 3in. planks bolted together and built in tightly between the opposite piles. It is afterwards well punned with clay. Then the inside of the gate piles above the sluice is covered with similar planking, fixed horizontally with screw bolts up to the level of the top. The gates, about 2ft. 4in. square, are formed 3ft. thick of oak or elm plank, bolted to cross battens, and to them are fixed screwed castings, which a long iron rod, with a screw at one end and a bevel wheel at the other, connects with a winch on the top of the dam; in this way the gates are raised or lowered as required.

When the bottom is covered with a great depth of silt it is preferable, to insure the stability of the dam, to widen its base by increasing the number of walls, rather than by driving them deeper into the bottom; and this may also be aided to some extent by battering the outer and inner walls about ¾in. to the foot in depth. Battered piles, however, are very difficult to drive accurately, the piles in some soils having to be frequently withdrawn and corrected. Piles in hard ground are considered sufficiently driven when they only advance ¼in. per stroke of the ram, when the average "go," as the movement of the pile is termed, throughout the drive has been 2½in. per stroke. The pile must be carefully watched when it goes hard, to see that it is not shattered or damaged by the ram, as such injury may subsequently cause serious leakage. The sound of the blow is a good indication of the effect. It should be a dead thump ceasing immediately the blow has been struck. If there is any cracking, hollow, or trembling sound the driving should be stopped at once. All pile heads should be fitted with wrought-iron hoops of suitable diameter and 1in. thick by 3in. wide. The head of the pile is chamfered off about 9in. down (as shown at page xxvi., No. CCXXXVIII.) to just fit the inside of the ring, which is entered and driven into place by the ram when the pile is arranged in position for driving. This method ensures a perfect fit. When the driving is finished the head of the pile is cut off and the ring used again, the life of a ring being for about 300 piles. Of the timbers suitable for piles, good, sound memel red fir is most frequently used. When very long piles are required, pitch pine (southern) or red cedar is chosen, but recently, in consequence of the tendency of the former to split under the ram, due to incipient cup shakes, the Australian karri-karri has been employed. For more permanent piling, such as pier heads, wharves, jetties, &c., teak or greenheart (the latter for sea-water) is the best to employ; it should be impregnated with creosote about 8lbs. to the cubic foot.
